Ekeberg, Anders Gustav (b. Jan. 16, 1767, Stockholm—d. Feb. 11, 1813, Uppsala, Swed.), Swedish chemist who in 1802 discovered the element tantalum. After graduation from the University of Uppsala (1788) and travels in Germany, Ekeberg returned to Uppsala and began teaching (1794), introducing the chemistry of Antoine-Laurent Lavoisier. Though he was partly deaf from a childhood infection and had been blinded in one eye by an exploding flask (1801), he carried on admirably. Perhaps his greatest contribution to chemistry was the discovery of the talent of his student Jöns Jacob Berzelius.

Ekelöf, Gunnar (b. Sept. 15, 1907, Stockholm—d. March 16, 1968, Sigtuna, Swed.), outstanding Swedish poet and essayist.

Ekelöf exerted great influence on his contemporaries. His radically modern style was influenced by such poets as Charles Baudelaire, Arthur Rimbaud, Ezra Pound, and T.S. Eliot. In such poetry from the 1930s as *Sent på jorden* (1932; "Late on Earth"), Ekelöf was drawn to the Surrealist technique of automatism (the spontaneous release of the subconscious in the creative act), but his work also reflects an interest in musical forms and Oriental mysticism. A student of Oriental languages, Ekelöf felt divided between mystical tendencies and rationalism. This conflict is apparent in *Färjesång* (1941; "Ferry Song") and *Non Serviam* (1945; "I Will Not Serve"). Central to Ekelöf's work is *En Mølne-elegi* (1960; "A Mølne Elegy"), published in several earlier versions from the mid-1940s. Its starting point is within the mind of the poet, sitting at Mølne dock on a summer day in 1940. Memories from his individual past intermingle with those of history in an endless panorama.

In the 1950s Ekelöf turned away from finished compositions to work in fragmentary forms, as in *Strouites* (1955; "Nonsense"). The last decade of his work is dominated by the Akritas trilogy, *Diwān över Fursten av Emgión* (1965; "Diwan over the Prince of Emgión"), *Sagan om Fatumeh* (1966; "The Tale of Fatumeh"; Eng. trans., *Selected Poems*), and *Vägvisare till underjorden* (1967; *Guide to the Underworld*). The trilogy contains Ekelöf's finest poetic expression of the simultaneous experience of presence and transitoriness. In 1958 Ekelöf became a member of the Swedish Royal Academy.

Ekhmin (Egypt): see Akhmim.

Ekhof, (Hans) Konrad (Dieterich), Ekhof also spelled ECKHOF (b. Aug. 12, 1720, Hamburg, Den. [now in Germany]—d. June 16, 1778, Gotha, Saxe-Gotha [Germany]), actor and director who, with Caroline Neuber and Friedrich Schröder, was a major influence in the development of a German theatrical tradition.

In 1739 Ekhof became a member of the company managed by Johann Friedrich Schöne-mann, an association that extended over 17 years. Ekhof played leading roles in German translations of French plays. During the company's stay at Schwerin (1751–56), domestic drama was added to the repertory, giving Ekhof the opportunity to perform in plays of George Lillo, Gotthold Lessing, and Edward Moore.

In Schwerin, Ekhof initiated a dramatic academy (1753) with fortnightly meetings in which he discussed with his colleagues the problem of the actor's craft and civic responsibility. His prestige lent dignity to the short-lived but important Hamburg National The-

atre. He spent the last three years of his life in Gotha in charge of the new court theatre. Ekhof was among the earliest theorists on German drama and was responsible for a freer, more natural style of acting.

Ekibastuz, city and major open-pit coal-mining centre in Pavlodar *oblast* (province), northeastern Kazakhstan, on the Irtysh-Karaganda Canal. Coal was discovered in the region in 1876 and was mined on a small scale. Only after construction of a railway in 1953 did large-scale exploitation of Ekibastuz' rich but low-grade coal seams begin. In the 1970s Ekibastuz was the third largest coal-mining centre in the Soviet Union, but still consisted of isolated settlements, although a city centre was emerging. A regional station for the production of electrical power is located near the city to provide power for export to European Russia and to the Urals. The city has a plant for the production of reinforced concrete, a repair plant for transport and mining equipment, a dairy, a brewery, and a number of educational institutions. Pop. (1991 est.) 138,900.

ekistics, science of human settlements. Ekistics involves the descriptive study of all kinds of human settlements and the formulation of general conclusions aimed at achieving harmony between the inhabitants of a settlement and their physical and sociocultural environments. Descriptive study involves the examination of the content, such as man alone or in societies, of a settlement, and the settlement container, or the physical settlement, composed of natural and human-made elements. The examination of settlement content and the physical settlement involves the investigation of five basic elements of human settlement: nature, including physical geography, soil resources, water resources, plant and animal life, and climate; human biological and emotional needs, sensations and perceptions, and moral values; society, including population characteristics, social stratification, cultural patterns, economic development, education, health and welfare, and law and administration; shells, or structures, in which people live and function, such as housing, schools, hospitals, shopping centres and markets, recreational facilities, civic and business centres, and industries; and networks, or systems, that facilitate life and day-to-day functions of inhabitants such as water and power systems, transportation networks, communication systems, and the settlement's physical layout.

A result of the descriptive study of human settlement and its five basic elements is settlement classification according to the size and number of units which form the settlement; the permanency of the settlement or the degree to which it is continually inhabited; the method by which the settlement was created, such as a settlement that emerged or evolved naturally or one that was preconceived; and the most important form of settlement classification, that according to purpose or function. The most common functional classifications are rural settlements, institutional settlements established for a specific purpose, and urban settlements.

The descriptive study of human settlements also analyzes the anatomy of the settlement. Settlements or parts of settlements can be classified according to their degree of functional homogeneity, the type and number of central place functions, the circulatory patterns found within the settlement, or any special function or purpose observable in the settlement. The main purpose or function of a settlement can serve to categorize the settlement as a homogeneous region, such as a single farmstead classified as a homogeneous agricultural region or a bedroom community identified as a homogeneous residential region. Human settlements can be identified as central places that function as marketplaces, administrative centres,

and social and cultural meeting places serving surrounding hinterlands. Circulatory patterns unite settlements by providing transport of people, goods, and information along lines of circulation such as roads. Nodal regions, or settlements, often form at the intersection of circulatory lines. Unique functions observable within a settlement sometimes are identified as a special settlement area, such as an army camp within a larger residential settlement or a large factory or business in the midst of a relatively homogeneous residential area. Most human settlements possess some form of all these types at some geographic scale.

Unlike other disciplines or sciences interested primarily in one element of human settlement—such as society (sociology) or shells (architecture or engineering)—ekistic study draws upon the knowledge of economics, social science, technical disciplines, and cultural disciplines. Two fields of study closely allied to ekistics are urban geography and regional science, but neither claims the comprehensive approach advocated in ekistics. By drawing from the knowledge of other fields of study in the classification and anatomical study of human settlements, ekistics seeks to draw general conclusions or formulate theories or laws that can be used by builders, planners, architects, engineers, and other creators of human settlements in prescriptive action to cure the maladies of existing settlements and prevent such ills in future settlements.

Ekkehard I THE ELDER, also called EKKEHARD I OF ST. GALL, Ekkehard also spelled EKKEHART (b. c. 910, Toggenburg?, Alemannia [now in Switzerland]—d. Jan. 14, 973, Sankt Gallen), teacher, monk, hymnist, and poet who until about 1941 was regarded the author of *Waltharius*, a celebrated Latin heroic poem based on the life of King Walter of Aquitaine.

Of noble birth, Ekkehard was educated at the Benedictine monastery of Sankt Gallen (St. Gall) in Switzerland, then one of Europe's greatest centres of learning, at which he later taught.

After being elected dean of the monastery in 957, Ekkehard went to Rome, where he was well received by Pope John XII. He retired to Sankt Gallen and was chosen abbot but declined the position, recommending one Burkard, whom he continually advised. A noted economist, Ekkehard rejuvenated the intellectual and ecclesiastical prestige that had distinguished Sankt Gallen for centuries. Adjacent to the monastery, he founded a hospice for travelers and the sick.

Among his extant hymns are those honouring the Trinity and Saints Columban, John the Baptist, and Stephen. The belief that Ekkehard was also the author of the famous *Waltharius* epic stems from a statement in the *Casus Sancti Galli*, a history of Sankt Gallen written in part by Ekkehard IV, that Ekkehard I—while still in abbey school—composed a *Vitam Waltharii manu fortis* as a school exercise for his master Geraldus. That an individual named Geraldus, or Gerald, dedicated the work to Bishop Erkanbald of Strasbourg is clear; scholars now tend to attribute the entire 1,456-line *Waltharius* epic to Geraldus. Certain scholars have suggested that the life of Waltharius to which Ekkehard IV refers is in fact a different Waltharius.

Ekkehard IV (b. 980?, Alsace [now in France]—d. Oct. 21, 1069?, Sankt Gallen [now in Switzerland]), teacher, glossarist, writer, famous as one of the principal authors of *Casus Sancti Galli* ("The Events of Sankt Gallen [St. Gall]")—an important history of the monastery.

He grew up at Sankt Gallen, being educated by the celebrated German scholar Notker

Labeo, Ekkehard I's nephew. From sometime after 1022 until 1031 he was director and teacher of the cathedral school of Mainz, where he became known for his vast store of knowledge, earning the patronage of the emperor Conrad II.

Returning to Sankt Gallen, Ekkehard began work on the *Casus*, begun and carried on by others. *Casus* records traditions of the ancient abbey and, despite its uneven Latin and inaccuracies, supplies a valuable source for contemporary history and culture. About 1030 Ekkehard revised and corrected a *Waltharius*, which he claims in *Casus* to have been written by Ekkehard I. Since the mid-20th century scholars have disputed Ekkehard I's authorship of the famous *Waltharius*.

Among Ekkehard IV's other important literary works is the *Liber benedictionum* ("Book of Benedictions"), a collection of inscriptions, blessings, and poems (some of them his own and others attributed to Notker Labeo). Ekkehard was also known to have been a skillful church musician.

Ekklësia (in ancient Greece): see *Ecclesia*.

Ekman, Gösta (b. Dec. 28, 1890, Stockholm—d. Jan. 12, 1938, Stockholm), Swedish actor and director noted for his versatility on stage and screen.

Ekman premiered in 1906 at Stockholm's Oscar Theatre and, after an apprenticeship on tour and in the provinces, returned to Stockholm (1913) to win acclaim for his classic portrayals, such as Lionel in Friedrich Schiller's *Maid of Orleans* (1914), Claudio in *Much Ado About Nothing* (1916), and Romeo in *Romeo and Juliet* (1919). His later career fit the same mold. During his tenures in the company of the Svenska Theatre (1913–25), as comanager of the Oscar Theatre (1926–31) with John and Pauline Brunius (the latter, an actress of note, became Ekman's wife), and as manager of the Vasa Theatre (1931–35), Ekman starred in such roles as Tartuffe (1927), Hamlet (1934), and Shylock (1936) while also directing and appearing in plays by Henrik Ibsen, August Strindberg, George Bernard Shaw, and others. His film career, begun in 1912, followed a similar path. His appearance in a silent film *Hamlet* (1918) aroused considerable interest, his title role in *Charles XII* (done in two parts, in 1924 and 1925) received international attention, and his *Faust*, directed by F.W. Murnau (1926), remains of contemporary interest. Ekman co-directed the film *A Perfect Gentleman* (1927) and appeared in the Swedish version of *Intermezzo* (1937) with Ingrid Bergman.

Ekman was the author of several books and received the medal Litteris et Artibus from the Swedish king. His son, Hasse Ekman, himself a prominent film actor and director, wrote a biography of his father in 1938.

Ekman, V(agn) Walfrid (b. May 3, 1874, Stockholm—d. March 9, 1954, Gostad, near Stockaryd, Swed.), Swedish physical oceanographer best known for his studies of the dynamics of ocean currents. The common oceanographic terms Ekman layer, denoting certain oceanic or atmospheric layers occurring at various interfaces; Ekman spiral, used in connection with vertical oceanic velocity; and Ekman transport, denoting wind-driven currents, derive from his research.

Ekman was the youngest son of Fredrik Laurentz Ekman, a Swedish physical oceanographer. After finishing secondary school in Stockholm, Ekman studied at the University of Uppsala, where he majored in physics. But lectures on hydrodynamics in 1897 by Vilhelm Bjerknes, one of the founders of meteorology and oceanography, definitely decided the direction of Ekman's work.

V. Walfrid Ekman, 1928

By courtesy of the Lunds Universitet, Sweden

While still a student at Uppsala, Ekman made important contributions to oceanography. When it was observed, during the Norwegian North Polar Expedition, that drift ice did not follow the wind direction but deviated by 20° to 40°, Bjerknes chose Ekman to make a theoretical study of the problem. In his report, published in 1902, Ekman took into account the balance of the frictions between the wind and sea surface, within layers of water, and the deflecting force due to the Earth's rotation (Coriolis force).

After taking his degree at Uppsala in 1902, he joined the staff of the International Laboratory for Oceanographic Research in Oslo, where he remained until 1909. During those years he proved to be a skilled inventor and experimentalist. The Ekman current meter, an instrument with a simple and reliable mechanism, has been used, with subsequent improvements, to the present, while the Ekman reversing water bottle is used in freshwater lakes and sometimes in the ocean to obtain water samples at different depths with a simultaneous measurement of water temperatures. He displayed his theoretical and experimental talents in his study of so-called dead water, which causes slow-moving boats to become stuck because of a thin layer of nearly fresh water spreading over the sea from melting ice. This phenomenon, frequently occurring in fjords, seriously impeded the Norwegian explorer Fridtjof Nansen in Arctic waters. Ekman demonstrated by experiments in a wave tank that the resistance to the motion of the vessels is increased by the waves that are formed at the interface between layers of water of different densities.

He also derived an empirical formula for the mean compressibility (compression ratio divided by pressure) of seawater as a function of pressure and temperature. This formula is still in use today to determine density of deep seawater which is compressed by hydrostatic pressure.

Offshore waterflood platform in the Ekofisk field in the North Sea

From 1910 to 1939, Ekman was professor of mechanics and mathematical physics at the University of Lund in Sweden, where he pursued his main interest, the dynamics of ocean currents. He published theories on wind-driven ocean currents, including the effects of coasts and bottom topography, and on the dynamics of the Gulf Stream. He also tried, with partial success, to solve the complex problem of ocean turbulence.

In 1925 Ekman participated in a cruise of a German research ship to the Canary Islands. On finding that data on currents obtained for several days at several marine stations between the Bay of Biscay and the Canary Islands were not sufficient to obtain an average figure, he and a colleague, during the years 1922–29, improved the technique for measuring currents for a prolonged period by collecting data from an anchored ship. After several preparatory cruises for that purpose off the Norwegian coast aboard a Norwegian research vessel, they made a cruise to the trade-wind region off northwestern Africa in the summer of 1930 to determine the average current at various ocean depths at stations occupied for two weeks or longer. Preliminary reports were published soon after the cruise, but Ekman wrote the final report in 1953 at the age of 79. The long delay in publication, partly owing to the loss of important data during the German occupation of Norway, also indicates the unparalleled care he took with his work.

Although his name and achievements were well known among oceanographers, he rarely attended international meetings—but his genuine kindness prevented him from becoming a recluse. Most of his teachers and friends, such as Nansen and Bjerknes, were Norwegian; he spent many vacations in Bergen. He sang a beautiful bass, spent much time at the piano, and occasionally composed music. In the fall of 1953, he began a study of turbid currents, which he continued until a few days before his death. (T.Ic.)

BIBLIOGRAPHY. Further information on his life and a selected bibliography of his works may be found in Charles Coulston Gillispie (ed.), *Dictionary of Scientific Biography*, vol. 4 (1971), pp. 344–345.

Ekofisk, group of Norwegian offshore natural-gas and oil fields located in the North Sea about 180 miles (290 km) southwest of Norway, halfway between Norway and the United Kingdom. The Ekofisk district includes the Ekofisk field itself (1969; petroleum) and the original, relatively small natural-gas discovery at Cod (1968), as well as petroleum fields at Tor (1970), West Ekofisk (1970), and Albuskjell (1972). Production began in 1971; by 1980 there were 18 offshore platforms and 50 operating wells. The Ekofisk field is the major producer in the group. A pipeline carries petroleum from Ekofisk to refineries in Teesside, England; a natural-gas pipeline extends from the Cod field to Emden, Ger.

Ekoi, group of peoples situated in extreme southeastern Nigeria and extending eastward into neighbouring Cameroon. Ekoid Bantu languages are spoken by many groups, including the Atam, Boki, Mbembe, Ufia, and Yako. The Ekoi live in proximity to the Efiks of southeastern Nigeria and claim to have migrated from the north to that area. The inhabitants of Kwa, located near Calabar, claim to be the first Ekoi to have migrated from the north.

The Ekoi believe that the heirs of the first settler own the land; while newcomers are not allowed to buy land, they are able to purchase rights of settlement. Ekoi men have traditionally hunted, while women have engaged in agriculture, raising yams, plantains, and corn (maize). Women also fish, and both men and women participate in weaving.

Ekoi towns are ruled by councils of elders, but townspeople are free to attend meetings. Native courts that were instituted under British administration provide an appeals system outside of the decision making by the elders. Representatives from various towns sit on the courts.

The primary traditional Ekoi deities are Obassi Osaw, the sky god, and Obassi Nsi, the earth god. Ancestors and natural forces are also emphasized in Ekoi worship. Various Ekoi cults are devoted to the welfare of common activities, such as farming. Before the establishment of British colonial administration, the *egbo* was a prominent Ekoi secret society that had strong social regulatory functions as well as influence in religious matters. Members of the *egbo* used a form of ideographic writing called *nsibidi*, variations of which were formerly found among other ethnic groups in southeastern Nigeria.

The Ekoi practice traditional medicine and have treated such diseases as smallpox with local medicinal plants. In addition to displaying an extensive knowledge of and aesthetic appreciation for flowers, the Ekoi create mural paintings on sanctuaries, make pottery, and carve figures in solid basaltic blocks. They are also known for their large, skin-covered masks.

Articles are alphabetized word by word,
not letter by letter

Ekrem, Rezaide Mahmud (b. March 1, 1847, Constantinople, Ottoman Empire [now Istanbul, Turkey]—d. Jan. 31, 1914, Constantinople), writer who was one of the outstanding figures in 19th-century Turkish literature.

The son of a poet and scholar, Ekrem was apprenticed to a number of government offices after his formal education. Later he became an official in the Council of State and a teacher of Turkish literature at the renowned Galatasaray Lycée and at the Mülkiye Mektebi (Imperial School of Political Science) in Constantinople. After the Young Turk Revolution in 1908, he held several government posts, finally becoming senator.

Writing in the traditional Ottoman classical style early in his literary career, he came under the influence of the famous Turkish modernist Namık Kemal. Although never a great poet himself, Ekrem strove to redefine art and poetical form. Writing for *Servet-i Fünun*, an avant-garde literary and sometimes political periodical, Ekrem developed a great following among younger poets. Like many members of the contemporary French Parnassian movement, Ekrem adhered to the principle of "art for art's sake."

Among Ekrem's most important works are *Talim-i Edebiyat* (1882; "The Teaching of Literature"), a volume of literary criticism and theory; and *Tefekkür* (1888; "Meditations"), which contains poems and prose. He also wrote plays and made translations from the

French. As a theorist he had considerable influence on literary taste and ideas and on the work of later Turkish poets.

Ekron, ancient Canaanite and Philistine city, one of the five cities of the Philistine pentapolis, and currently identified with Tel Miqne (Arabic: Khirbat al-Muqanna'), south of the settlement of Mazkeret Batya, central Israel. Although it was allocated to Judah after the Israelite conquest (Joshua 15:11), Ekron was a Philistine stronghold in David's time (1 Samuel 17:52); it was associated with the worship of the deity Baalzebub ("Baal of the Flies"); though some would read instead Baalzebub, or "Baal of the Abode"; 2 Kings 1:2-18). Taken by Egyptian Pharaoh Sheshonk I, the biblical Shishak, in the course of his conquest of Palestine (c. 918 BC), it was later tributary to Esarhaddon and his son Ashurbanipal, kings of Assyria (7th century BC). The city was known as Akkaron, or Accaron, in Hellenistic and later times, and the church historian Eusebius of Caesarea (fl. 4th century) mentions the existence of a Jewish population there during his lifetime.

By the late Middle Ages, Ekron had been abandoned; unlike other Philistine cities, such as Ashqelon, or Ashdod, no tell (or mound) bore its name throughout the centuries, though it survived in the Arab village of 'Aqir, which was first identified with Ekron by the 19th-century American biblical scholar Edward Robinson. In 1883 Baron Edmond de Rothschild founded a Jewish settlement adjoining 'Aqir, which he named Mazkeret Batya (Hebrew: "Memorial [to] Batya"), in honour of his mother; the name Ekron (now officially Qiryat 'Eqrone) was subsequently given to an adjoining new immigrants' settlement, established in 1949. However, the names 'Eqrone and 'Aqir are still often used for the older settlement.

Another site suggested by some scholars for ancient Ekron is Qidron (Arabic: Qatra), 3 miles (5 km) south of Mazkeret Batya.

ekthesis (Greek: "to expose," or "to set forth"), in logic, process used by Aristotle to establish the validity of certain propositions or syllogisms. For example, in the *Analytica priora* he argued: "If A belongs to no B; neither will B belong to any A; for if it did belong to any A, say Γ (gamma), it would not be true that A belonged to no B; for Γ is one of the B's." Ekthesis refers in particular to the creation of a new term (in this case, Γ) that, together with the principle of *reductio ad impossibile* (a method of proving a proposition by showing that its denial leads to a contradiction), allows the deduction of the desired result.

Ekvthime Mthatzmideli (religious leader): see Euthymius the Hagiorite.

Ekwensi, Cyprian, in full CYPRIAN ODIATU DUAKA EKWENSI (b. Sept. 26, 1921, Minna, Nigeria), Igbo novelist, short-story writer, and children's author whose strength lies in his realistic depiction of the forces that have shaped the African city dweller.

Ekwensi was educated at Ibadan (Nigeria) University College and at the Chelsea School of Pharmacy in London. His early works include the novellas *When Love Whispers* (1947) and *The Leopard's Claw* (1950), which combine a fascination for urban life with earnest exhortations to avoid its pitfalls. *People of the City* (1954; rev. ed., 1969) is a commentary in a journalistic style on the problems of corruption, bribery, and despotism as seen through the eyes of a crime reporter and dance-band leader in Lagos.

Jagua Nana (1961), Ekwensi's most successful novel, has as its protagonist Jagua, a charming, colourful, and impressive prostitute. Around her, Ekwensi sets in motion a whole panoply of vibrant, amoral charac-

ters who have rejected their rural origins and adopted the opportunistic, pleasure-seeking urban lifestyle. Similar characters and themes emerge from the well-written *Lokotown and Other Stories* (1966), where the glitter and excitement of Lagos life is sharply contrasted with its seediness and degradation. *Burning Grass* (1962) concerns Fulani cattlemen in the north of Nigeria. A sequel to *Jagua Nana*, entitled *Jagua Nana's Daughter*, was published in 1986, and *For a Roll of Parchment*, his 33rd novel, appeared in 1987.

He also wrote a number of children's books and a collection of Igbo folktales. Although some of his writings suffer from shallow characterization, his work remains an outstanding chronicle of Nigerian city life and appealed to a broad audience.

El (Semitic: "God"), the chief deity of the West Semites. In the ancient texts from Ras Shamra (ancient Ugarit) in Syria, El (El the Bull) was described as the titular head of the pantheon, husband of Asherah, and father of all the other gods (except for Baal). Although a venerable deity, he was not active in the myths, which primarily concerned his daughters and sons.

He was usually visually portrayed as an old man with a long beard and, often, two wings. He was the equivalent of the Hurrian god Kumarbi and the Greek god Cronus. Writers of the Old Testament used the word El both as a general term for "deity" and as a synonym for Yahweh.

El Aaiún, also spelled AAIÚN, AIUN, or LAÂYOUNE, town, capital of Western Sahara from 1940 to 1976 (when Western Sahara was a northwest African overseas province of Spain) and capital since 1976 of the not internationally recognized Laâyoune province of Morocco. El Aaiún lies in the Wadi Hamra region, in the northern part of Western Sahara, 8 miles (13 km) inland from the Atlantic Ocean.

The town, whose Arabic name means "water sources," was developed by the Spaniards in 1938 as the administrative, military, and European population centre of the former province. Nearby oases supply water. Before 1976, phosphate deposits were exploited at Bu Craa (Bou Craa) to the southeast, and a conveyor 65 miles (104 km) long was constructed to bring the ore from there to a loading pier at El Aaiún beach. During the guerrilla warfare conducted against Morocco by the Polisario Front, the conveyor was often damaged. El Aaiún was the site of talks between the Polisario Front and Moroccan officials. Pop. (1994) 139,500.

El Agustino, community of El Agustino *distrito* ("district"), Peru, in the east-central Lima-Callao metropolitan area. It was founded about 1955, when tenant farmers found it more profitable to lease land for residences than to cultivate it. El Agustino and neighbouring communities were granted district status in 1965. Within walking distance of Lima, the town is poorly laid out; adobe or brick houses and shops line its narrow, twisting alleys. There are schools and a clinic. Pop. (1990 est.) district, 171,280.

El-al ben Shachar: see Hillel ben Samuel.

El Al Israel Airlines, Hebrew EL AL NETIVE AWIR LE-YISRA'EL, Israeli airline founded by Israel in November 1948 after the establishment of the new nation. It flew its first commercial scheduled flights—to Rome and Paris—in July 1949, and by the 1980s it was flying routes from Jerusalem and Tel Aviv to many of the major cities of Europe, as well as to Asia, Africa, and the Americas.

A subsidiary, Teshet, wholly owned by El Al,

operates travel agencies, catering facilities in Israeli and U.S. airports, and hotels in Israel. Another subsidiary, Arkia Inland Airlines, founded in 1950 and owned 50 percent by El Al, provides scheduled air services within Israel.

El-Araish (Morocco): see Larache.

El Argar, culture characterized by a flourishing metallurgy of bronze, silver, and gold that appeared at the beginning of the 2nd millennium BC in the Almería (southeastern) region of the Iberian Peninsula. The culture, which developed a lively trade with centres in the eastern Mediterranean, reached its peak between 1700 and 1000 BC and spread throughout the southern, central, and Levantine regions as well as to the Balearic Islands.

El Banco, city, Magdalena *departamento*, northern Colombia, at the junction of the Magdalena and César rivers. The conquistador Gonzalo Jiménez de Quesada arrived at the site in 1537 and found the Indian village of Sompallón; he called it Barbudo ("Bearded One") because of its bearded chief. In 1544 Alonso de San Martín renamed it Tamalameque (now the name of a town a few miles to the southeast). In 1749 José Domingo Ortiz, a freed black slave carrying a statue of the Virgin Mary, led a group of settlers to the locality that became known as Nuestra Señora de la Candelaria de El Banco ("Our Lady of Candlemas of the Riverbank"). Fishing and stock raising are the chief occupations, although small factories produce mattresses and brooms. Pop. (1993) 47,000.

El-Buheyrah (The Sudan): see Buḥayrah, Al.

El Callao, town, Bolívar *estado* ("state"), eastern Venezuela, on the right bank of the Yuruari River, about 135 miles (272 km) east-southeast of Ciudad Bolívar in the Venezuelan Guiana Highlands. The town has been a gold-mining centre since 1871, following the discovery of the metal in that year, and by 1885 had become the world's leading producer. The first gold rush was over by 1899, and the mines were for long thought to be exhausted, but a combination of new technology and high gold prices in the 1970s led to the redevelopment of the mines by Minerven, a Venezuelan national mining corporation; production at its new facilities began in 1981. Pop. (1981) 6,615.

El Cayo (Belize): see San Ignacio.

El Centro, city, seat (1907) of Imperial county, southeastern California, U.S., 120 miles (193 km) east of San Diego. A desert community located 52 feet (16 m) below sea level, it is the largest settlement in the United States below sea level. El Centro was laid out in 1905 by W.F. Holt and developed as a commercial and transportation centre for the irrigated Imperial Valley. The National Parachute Test Range is there, and geothermal energy based on local well drilling was being developed in the 1980s. Inc. 1908. Pop. (2000) 37,835.

El Cerrito, city, Contra Costa county, Calif., U.S., on the eastern shore of San Francisco Bay, north of Oakland, and 14 miles (22.5 km) northeast of San Francisco via the San Francisco-Oakland Bay Bridge. The early village, named Rust after a German blacksmith and storeowner who lived there, did not grow until the establishment of a railroad terminal and harbour at neighbouring Richmond in the early 1900s. The San Francisco earthquake and fire of 1906 resulted in a spurt of settlement, and thereafter a slow growth took place, culminating in the incorporation of the city of El Cerrito in 1917. Subsequent growth ac-

companied the economic development of the San Francisco Bay area but was particularly affected by that of Richmond. El Cerrito is largely residential, with the greater part of the working population employed in Richmond, Oakland, and San Francisco. The city has had a council-manager form of government from 1948. Pop. (2000) 23,171.

El-Djem (Tunisia): see Thysdrus.

El Dorado, city, seat (1843) of Union county, southern Arkansas, U.S. The site was selected in 1843 by Robert Black, John Hampton, and Green Newton, who were instructed to centrally locate the county seat. Its Spanish name was supposedly given by Matthew Rainey, the first settler. Lumber and cotton were the basic products before oil was discovered in 1921 in the Bussey Well. The town boomed, and oil production, refining, and petrochemicals are now the major industries. Conservation methods pioneered in the nearby Schuler Field have been adopted by the national oil industry. Inc. town, 1845; city, 1905. Pop. (2000) 21,530.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

El Escorial, village, Madrid *provincia* and *comunidad autónoma* ("autonomous community"), central Spain, in the Guadarrama mountains, 26 miles (42 km) northwest of Madrid. It is the site of the Royal Monastery of San Lorenzo del Escorial, a monastery originally Hieronymite but occupied since 1885 by Augustinians.

Philip II wanted a monastery at El Escorial as a place where all Spanish sovereigns beginning with the emperor Charles V could be buried; all of them have been interred there, with the exception of Philip V, Ferdinand VI, and Alfonso XIII. One of the largest religious establishments in the world (about 675 by 528 feet [206 by 161 m]), El Escorial was begun in 1563 by Juan Bautista de Toledo, a Renaissance Spanish architect who had worked earlier in Italy, and was completed after his death in 1567 by Juan de Herrera.

El Escorial, Spain
By courtesy of the Spanish National Tourist Office

Toledo is responsible for the general plan of El Escorial monastery, consisting of a great rectangle of three parts, the centre being occupied by the church. On the south are five cloisters in which are included the royal palace and offices; on the north are the living quarters of the monks. Herrera made extensive revisions in the designs, prepared new plans for the church (1572), and brought the whole building to completion in 1584. The massive walls of the interior, relieved only by Doric pilasters with no concession to decorative richness, produced a monument that was austere

beyond anything the Italian Renaissance ever envisaged. On the exterior the gigantic scale of the monastery and the severe gray granite walls are forbidding. There Herrera established his fame and the Herrera style, which was to prevail in Spain for half a century.

El Escorial library, founded by Philip II, houses a rare collection of more than 4,700 manuscripts, many of them illuminated, and 40,000 printed books. Pop. (1999 est.) 10,053.

El Ferrol, city, La Coruña *provincia*, in the *comunidad autónoma* ("autonomous community") of Galicia, in extreme northwestern Spain on the Ferrol Inlet of the Atlantic Ocean. Named for a *farol* ("lighthouse") that marked the entrance to its harbour, the then fishing village of El Ferrol was chosen in 1726 by King Philip V as the site for a naval base. Ferdinand VI set up (1746-59) shipbuilding yards there; and between 1769 and 1774 Charles III added the royal naval arsenal and erected fortifications. After 1939 the city's name became El Ferrol del Caudillo because it was the birthplace of General Francisco Franco, who had become caudillo (leader) of Spain; in the 1980s, however, the longer name was abolished.

Now one of the principal Spanish naval stations, El Ferrol's natural harbour, protected from the sea by rocky hills, is the third largest in Spain. It did not develop commercially, however, because of competition from La Coruña, 12 miles (19 km) to the southwest by sea, and because it had no railway until 1904. The port has shipbuilding yards and a large arsenal basin, with workshops and foundries, as well as a naval academy and several dry docks. Exports are insignificant, and imports are mostly materials for use in the shipbuilding industry. Nearby are the Atlantic submarine base La Graña and the notable 10th-century Chamorro church surrounded by Celtic megalithic ruins. Pop. (1999 est.) 81,991.

El Malpais National Monument, high-valley lava-flow area, Valencia county, N.M., U.S. The area covered by black lava flow extends about 85,000 acres (34,400 hectares), although the designated national monument covers 114,716 acres (46,424 hectares).

The elevation of El Malpais (Spanish: "The Badlands") ranges from 6,400 to 8,400 feet (1,950 to 2,560 m). Features include a 17-mile- (27-kilometre-) long lava tube system, a number of ice caves, volcanic cinder cones, one of New Mexico's largest natural arches, and more than 20 gas and lava spatter cones. The area is also believed to have been a point of contact for the Mogollon, Anasazi, Patayan, and Sinauga cultures; there are many ruins in and around El Malpais. A number of ecosystems are found at El Malpais. Oneseed juniper (species *Juniperus monosperma*) and piñon pine (*Pinus edulis*) are the dominant tree species. Deer and antelope and mutant black furred field mice (*Microtus*) inhabit the area.

Designated a national natural landmark (1969) with the name Grants Lava Flow, it was not registered as such because of multiple ownership. In 1974 it was designated an Outstanding Natural Area and on Dec. 31, 1987, a national monument.

El Monte, city, Los Angeles county, Calif., U.S., 12 miles (19 km) east of downtown Los Angeles. The site, on the banks of the San Gabriel River, is considered the western terminus of the Old Spanish Trail (sometimes called the Santa Fe Trail, though unrelated

to the trail of that name from Missouri to New Mexico). Early on, the site was merely a camping place for pioneers, but in 1849 a stage station was established there, and the first dwellings (of adobe brick) and a schoolhouse were erected in 1852. El Monte was incorporated in 1912. It is now a residential suburb, with some light industry; its population increased more than fivefold between 1960 and 1970. Pop. (2000) 115,965.

El Morro National Monument, national monument in west-central New Mexico, U.S., 12 miles (19 km) southeast of Ramah. The national monument was established in 1906, with an area of 2 square miles (5 square km). El Morro (the "Headlands," or "Bluff"), or Inscription Rock, is a soft sandstone mesa rising 200 feet (60 m) above the valley floor and covering several acres. A water catchment basin and sheltered coves at its foot made it an important camping place on the trail to Cibola. Indians, Spaniards, and Americans left their inscriptions (1605–1774) on the cliff sides of the mesa. El Morro also has a number of pre-Columbian petroglyphs, and on its top lie ruins of Zuni Indian pueblos.

El Niño (Spanish: "The Christ Child"), in oceanography and climatology, the anomalous appearance, every few years, of unusually warm ocean conditions along the tropical west coast of South America. This event is associated with adverse effects on fishing, agriculture, and local weather from Ecuador to Chile and with far-field climatic anomalies in the equatorial Pacific and occasionally in Asia and North America as well.

The name El Niño was originally used during the 19th century by the fishermen of northern Peru in reference to the annual flow of warm equatorial waters southward around Christmas time. Peruvian scientists later noted that more intense changes occurred at intervals of several years and were associated with catastrophic seasonal flooding along the normally arid coast, while the thermal anomalies lasted for a year or more. The more unusual episodes gained world attention during the 20th century, and the original annual connotation of the name was replaced by that of the anomalous occurrence.

The timing and intensity of El Niño events vary widely. The first recorded occurrence of unusual desert rainfall was in 1525, when the Spanish conquistador Francisco Pizarro landed in northern Peru. Historians suggest that the desert rains and vegetation encountered by the Spaniards may have facilitated their conquest of the Inca empire. The intensity of El Niño episodes varies from weak thermal anomalies (2–3° C [about 4–5° F]) with only moderate local effects to very strong anomalies (8–10° C [14–18° F]) associated with worldwide climatic perturbations. El Niño events typically occur at three- to four-year intervals, with the strong events being less common. The intermittency varies widely, however, and the phenomenon is neither periodic nor predictable in the sense that ocean tides are.

Beginning with the work of Sir Gilbert Walker in the 1930s, climatologists recognized a similar interannual change in the tropical atmosphere, which Walker termed the Southern Oscillation (SO). El Niño and the Southern Oscillation appear to be the oceanic and atmospheric components of a single large-scale, coupled interaction—the El Niño/Southern Oscillation (ENSO). During the warm phase of ENSO, the South Pacific trade-wind system undergoes a change of state, or "seesaw," in which the westward-blowing trades weaken along the equator as the normally high pressure in the eastern South Pacific decreases and the low pressure over northern Australia and Indonesia rises. The pressure change and diminished trade winds cause warm surface water to move eastward along the equator from the

western Pacific, while the warm surface layer in the east becomes thicker. Under normal conditions, the northward-blowing winds off South America cause nutrient-rich waters to upwell from below the shallow, warm surface layer. The nutrients (mainly phosphates and nitrates) provide a plentiful supply of food for photosynthesizing plankton, on which the fish feed. During El Niño, however, the thicker surface layer acts as a barrier to effective upwelling by the coastal winds. The unenriched surface waters are poor in nutrients and cannot support the normally productive coastal ecosystem. Fish populations are decimated as great numbers migrate to less-affected areas in search of food, resulting in temporarily reduced yields for the countries in the region. In 1972–73 this led not only to local economic setbacks but to repercussions in the world commodity markets as well.

The warm ocean conditions in the equatorial Pacific induce large-scale anomalies in the atmosphere. Rainfall increases manyfold in Ecuador and northern Peru, causing coastal flooding and erosion and consequent hardships in transportation and agriculture. Additionally, strong El Niño events are associated with droughts in Indonesia, Australia, and northeastern South America and with altered patterns of tropical storms in the tropical belt. During the stronger El Niño episodes, the atmospheric "teleconnections" are extensive enough to cause unusually severe winter weather at the higher latitudes of North and South America.

The most intense event of the 20th century began in mid-1982 and ended in mid-1983. Sea-surface temperatures in the eastern tropical Pacific and much of the equatorial zone farther west were 5–10° C (9–18° F) above normal. Australia was hit by severe drought; typhoons occurred as far east as Tahiti; and central Chile suffered from record rainfall and flooding. Also, the west coast of North America was unusually stormy during the winter of 1982–83, and fish catches were dramatically altered from Mexico to Alaska. (D.B.En.)

El Oriente, region of eastern Ecuador, comprising the eastern slopes of the Ecuadorian Andes and the lowland areas of rain forest in the Amazon basin. It is bounded on the north by San Miguel and Putumayo rivers and on the east and south by Peru. El Oriente has an area of about 50,000 square miles (130,000 square km) and consists of little-explored and virtually unexploited tropical forest inhabited by a tiny fraction of the country's population, living mostly in small villages along the river courses. A sizable fraction of the population are Indians. Illiteracy is widespread, although the Roman Catholic Salesian missions have established a few boarding schools.

Timber and petroleum are the major economic resources, although their exploitation has been minimal. Agriculture includes grazing for cattle and limited cultivation of corn (maize) and oranges. Plantains and cassava are important staple food crops.

El Paraíso, also called CHUQUITANTA, Late Preceramic site in the present-day Chillón Valley on the central Peruvian coast, generally believed to date just before the beginning of the Initial Period (c. 2100–1800 BC). It is notable for its large mud and rock apartment-like dwelling units. It is believed to be roughly contemporaneous with the Preceramic Period structures of Kotosh, in the Peruvian highlands. El Paraíso buildings show a similar level of population density and architectural sophistication. The inhabitants of El Paraíso presumably depended upon both fishing and plant cultivation (probably not including corn [maize]) for their subsistence.

El Paso, city, seat (1850) of El Paso county, extreme western Texas, U.S., on the Rio Grande, there bridged to Ciudad Juárez, Mex.,

just south of the New Mexico line. The largest of the U.S.-Mexican border cities, it lies at the foot of the Franklin Mountains (at an elevation of 3,762 feet [1,147 m]) below a narrow pass where the Rio Grande issues from the bare southernmost spurs of the Rocky Mountains. The strategic site was recognized in 1598 by Juan de Oñate, colonizer of New Mexico, who called it El Paso del Norte ("The Pass of the North"). Franciscans established the Mission Nuestra Señora de Guadalupe there in 1659; the original church stands in the central square of Juárez. Spanish survivors of the Pueblo Revolt (1680–92) took refuge there and built other missions nearby, including one at Ysleta, site of the oldest town in Texas and now in El Paso. In 1776 the settlement comprised a string of hamlets and farms inhabited by 5,000 people. Not until after 1827 did a village exist on the river's north bank at the present site of El Paso. It became U.S. territory in 1848, when an army post was built (commemorated by the Fort Bliss Replica Museum).

The town, laid out in 1859, was on the Butterfield Stage Route to California. It grew slowly until 1881, when four railways arrived; by 1890 its population had increased more than 10-fold to 10,338. Meanders of the Rio Grande to the south resulted in border disputes in the 1860s; Mexican claims to El Chamizal, a wedge of land on the Texas side, were first filed in 1895. The dispute, involving relocating the river's channel, was finally resolved in 1967 and is commemorated by the Chamizal National Memorial.

Spanish language and culture distinguish the city. Its old adobe buildings are unmistakably Mexican, yet in general appearance El Paso is a modern American metropolis. It is the commercial and financial centre for an extensive trade territory where livestock ranching, irrigated cotton farming, and mineral production are major economic activities. El Paso has a highly diversified industrial structure centring on primary metals, petroleum and gas operations, food products, and apparel. Its copper-lead custom smelter and electrolytic copper refinery refines a significant portion of the nation's copper. Fort Bliss (home of the U.S. Army Air Defense Center), the William Beaumont General Hospital, and nearby White Sands Missile Range (in New Mexico) augment El Paso's economy.

A port of entry and an important foreign-trade and transcontinental crossroad on several major highways, it is served by both U.S. and Mexican railroads. It is a tourist gateway to Ciudad Juárez and the interior of Mexico and to scenic areas of the United States. The University of Texas at El Paso (site of the Sun Bowl) originated as the Texas State School of Mines and Metallurgy in 1913. El Paso Community College opened in 1969. Inc. 1873. Pop. (2000) city, 563,662; El Paso MSA, 679,622.

El Progreso, city, northwestern Honduras, on the Ulúa River, southeast of San Pedro Sula. The city, founded in 1927 as a banana trade centre, grew in the 1970s into a commercial and transshipment centre for the Caribbean ports and the interior. Industries include cement products, metalware, shoes, and coffee processing. The city is linked by rail to Puerto Cortés and is a hub for highways leading to San Pedro Sula, Tela, Yoro, and the Inter-Oceanic Highway; it also has an airfield. A steamship line operating on the Ulúa provides access to the Caribbean. Pop. (1986 est.) 58,300.

El Puerto de Santa María, port city, Cádiz provincia, in Andalucía comunidad autónoma ("autonomous community"), southern Spain, at the mouth of Guadalete River on Bahía

(bay) de Cádiz, southwest of Jerez de la Frontera. The Roman Portus Menesthei, it was once the site of naval arsenals and shipyards and was an oceanic captaincy general. It was from El Puerto de Santa María that the explorer Alonso de Ojeda sailed to the West Indies. Its chief economic activity is the production and blending of sherry wines, which are exported. Pop. (1987 est.) 48,900.

El Reno, city, seat of Canadian county, central Oklahoma, U.S., on the North Canadian River, immediately west of Oklahoma City. Settled in 1889 when the Rock Island Railroad arrived, the town was named for old Fort Reno (1874; now a livestock experiment station). The opening (1901) of the Kiowa-Apache-Comanche Indian reservation to settlement stimulated development.

El Reno is an agricultural processing and shipping centre with diversified industry, including railroad shops and the manufacture of trailers, metal products, and fertilizers. El Reno Junior College was opened in 1938. A federal correctional centre, a state game farm, and the Cheyenne and Arapaho Agency and School are nearby. The Canadian County Historical Society maintains a museum of Indian and pioneer artifacts in the city. Inc. 1893. Pop. (1990) 15,414.

El Salvador, officially REPUBLIC OF EL SALVADOR, Spanish REPÚBLICA DE EL SALVADOR, smallest of the seven Central American countries but also the most densely populated. It is bounded on the south by its 210-mile (335-kilometre) Pacific coast, on the northwest by Guatemala, and on the northeast and east by Honduras. The capital is San Salvador. Area 8,124 square miles (21,041 square km). Pop. (1992 est.) 5,487,000.

El Salvador

A brief treatment of El Salvador follows. For full treatment, see MACROPAEDIA: Central America.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. El Salvador is divided into two highland mountain ranges and three areas at lower elevations. The northern mountains, composed of the Metapán and the Chalatenango chains, form the border with Honduras in the north and descend in the south to the interior plain of the Lempa River valley, running generally east to west; the valley then rises to meet higher volcanic ranges to the south. Of the 20 major volcanoes located in these southern ranges, several are active and one erupted as recently as 1946. Santa Ana, an inactive volcano, is the country's highest peak, at 7,812 feet (2,381 m) above sea level. The volcanoes of the southern ranges

are separated by a series of basins, situated at elevations of between 3,500 and 5,000 feet (1,000 and 1,500 m) and commonly referred to as El Salvador's central plain; it is an area of rich volcanic soils and covers roughly a fourth of the total land area. A narrow coastal plain south of the volcanic ranges extends the length of the country along the Pacific. Of El Salvador's more than 300 rivers, only the Lempa is partly navigable.

The Pacific lowland areas are generally hot and humid, with temperatures averaging approximately 81° F (27° C) and rainfall averaging about 68 inches (1,700 mm) annually. Most of the rainfall is received during the May-October wet season. Much of the previously forested lowland area has been cleared for agriculture and pasture. The highlands are wetter, averaging more than 80 inches (2,000 mm) of precipitation annually. At the higher elevations (above 6,000 feet [1,800 m]) temperatures seldom reach above 65° F (18° C), and cloud forests predominate. Below 2,500 feet (800 m) the rain forests have been modified by extensive slash-and-burn cultivation. In between the two elevations, remnants of temperate oak and pine forests are found.

The people. Before the Spanish arrived in Salvadoran territory in the 16th century, it was occupied by five American Indian groups, of which the Pipils, whose civilization resembled that of the Aztecs in Mexico, were predominant. Some 90 percent of the contemporary population is mestizo (mixed European and Indian); about 5 percent is Indian (mostly Pipil), and 5 percent is of European descent. Before the Spanish conquest the most important Indian languages were Nahuatl, spoken in the central region, and Poton, spoken in the east; when Spanish was made the official language, the Indian dialects slowly fell into disuse. About 93 percent of the people are Roman Catholic.

The birth rate is about average in comparison with other Central American countries, but the death rate is much higher than average. About 45 percent of the population is under 15 years of age. The government has attempted to reduce birth, morbidity, and mortality rates. Severe economic conditions complicated by a civil war from 1979 to 1992 resulted in the flight out of the country of an estimated 20 percent of El Salvador's population.

The economy. El Salvador has a developing, mainly free-enterprise economy. The gross national product (GNP) had a negative growth rate during the 1980s. The GNP per capita is among the lowest in Central America. The major components of the GNP are trade, manufacturing, and agriculture.

Agriculture accounts for about one-tenth of the gross domestic product (GDP) but employs about two-fifths of the labour force. About 35 percent of the total land area is arable, and some 15 percent of the agricultural land is irrigated. Traditionally, most land has been owned by a small upper class; in

Sugarcane being harvested in Sonsonate, El Salvador

© Carl Frank/Photo Researchers

the early 1980s the government began what eventually became a largely futile attempt to redistribute the largest holdings. The principal crops grown for export are coffee, sugarcane, and cotton. Crops grown for local consumption include corn (maize), sorghum, oranges, bananas, rice, beans, avocados, cassava, and tomatoes.

Pastures cover about 29 percent of the land area; the principal livestock include cattle and pigs. The output of cereals, milk, and dairy products is not adequate for domestic needs, and these products and other foodstuffs must be imported. Remaining forests cover only about 5 percent of the land area. Most of the wood cut is used for fuel or charcoal.

Commercial fishing in Pacific waters has become important. Lobster and shrimp are the main catch, and both are exported.

El Salvador has few large mineral deposits. The principal minerals extracted include limited amounts of limestone, gypsum, salt, silver, and gold.

Manufacturing accounts for about one-fifth of the GDP and employs one-seventh of the labour force. Warfare and sabotage during the 1980s destroyed or damaged many industrial plants and caused anxiety among businessmen, investors, and workers. Major industries include petroleum refining; processing of sugar and cotton; and manufacture of textiles, clothing and footwear, cement, crude steel and semimanufactured steel products, pharmaceuticals, beer, and cigarettes. Electrical energy production is two-thirds hydroelectric, one-fifth nuclear, and the remainder from fossil fuels.

The government nationalized banking in 1980 but placed few other restrictions on industry. El Salvador has often been dependent on foreign aid, especially from the United States.

An autonomous state agency operates the country's narrow-gauge railroad. Only one-seventh of the road network is paved, and much of it is usable only in dry weather. The principal seaports are Acajutla, Cutuco (near La Unión), and La Libertad. There is an international airport at Cuscutlán, near San Salvador.

The principal exports are coffee, raw sugar, pharmaceuticals, shrimps, and cardboard boxes, mainly to the United States, Guatemala, and Germany. The main imports are mineral fuels, chemical products (including medicines), transport equipment, nonelectrical machinery and equipment, metal products, and food products, chiefly from the United States, Guatemala, Mexico, and Venezuela.

Government and social conditions. El Salvador is a republic whose government consists of a president and a legislative body (the Legislative Assembly) according to the constitution of 1983. The president is elected for a term of five years, and the 84 members of the Legislative Assembly are elected for three-year terms. The judiciary is headed by the Supreme Court of Justice. The armed forces have a strong voice in all government decisions, however.

There are numerous political parties and organizations active in El Salvador. Of these the conservative Nationalist Republican Alliance (Alianza Republicana Nacionalista) and the moderate leftist Christian Democratic Party (Partido Demócrata Cristiano) are the most important. The most significant opposition to the government comes from the Farabundo Martí National Liberation Front (Frente Farabundo Martí de Liberación Nacional), which is a coalition of several left-wing groups. Among its members were the guerrillas fighting the government in the civil war from 1979 to 1992.

El Salvador's social-welfare system provides benefits to most employed persons for work injury, sickness, maternity, old age, and disability. Despite these benefits, many parts of

the country experience poor health and sanitary conditions. Such diseases as typhoid fever and amoebic and bacillary dysentery can be found in rural areas. Moreover, most of the populace live in areas where malaria is endemic. Trained medical personnel are lacking in many parts of the country. Life expectancy at birth is about 67 years for males and 74 years for females.

Although primary education is free and compulsory in El Salvador, more than one-fifth of the people remain illiterate. The press is free and is owned by mostly conservative interests.

Cultural life. The country's culture has both Indian and Spanish elements. Just outside San Salvador are Mayan ruins. The capital's David J. Guzmán National Museum displays Indian artifacts from throughout El Salvador. In the modern town of Chalchuapa is the site of Tazumal, an important centre of pre-Hispanic civilization. Salvadorans continue to make traditional handicrafts.

History. When the Spaniards reached El Salvador in 1524, they found the Pipil Indians and their kingdom of Cuzcatlán situated in the western half of the country. The Pipil, of Nahua descent, probably arrived in the 11th century. Campaigns by Pedro de Alvarado subjugated them by 1539, and Spain divided El Salvador into two *alcaldías mayores* ("main alcalde districts"), San Salvador and Sonsonate, both attached to Guatemala. In 1786 San Salvador was raised to the rank of what was called an *intendencia* ("intendency"), but was still subordinate to Guatemala.

The first call for independence in Central America was made in San Salvador in 1811, by José Matías Delgado. When independence came in 1821, San Salvador was incorporated into the Mexican Empire. Upon its collapse in 1823, the United Provinces of Central America was formed, and Sonsonate and San Salvador constituted the new state of El Salvador, which was the last state to withdraw from the United Provinces (1840).

From its founding, El Salvador experienced a high degree of political turmoil, but power was usually in the hands of the wealthy, and presidents generally handpicked their successors. Political violence diminished somewhat until 1931, when, with the beginning of a succession of military dictatorships, violence became a continuing fact of life.

In the 1970s attacks and reprisals by both right- and left-wing groups increased substantially, gradually escalating into civil war by the end of the decade. The government, accused of atrocities, was ousted in 1979 in a coup. The resulting junta promised reform, order, and free elections. Elections held in 1982 set up a new government, with power centred in a popularly elected Legislative Assembly; however, civil unrest continued.

In 1983 a new constitution was adopted, and in the following years there were reasonably free presidential and legislative elections. El Salvador's 12-year-old civil war was ended diplomatically in 1992; however, there was a marked increase in violent crime during the 1990s, including assassinations of leftist politicians. The nation was heavily damaged by a powerful hurricane in 1998 and by a series of deadly earthquakes in 2001.

El Seibo, in full SANTA CRUZ DEL SEIBO, city, eastern Dominican Republic, on the Soco River. Founded in 1502, the city serves as a trading centre for the agricultural hinterland. The region yields cacao, coffee, sugarcane, and corn (maize), in addition to beeswax and medicinal plants. Cattle are also raised. The city lies on the main highway linking Santo Domingo with Higüey. Pop. (1993) 16,522.

El Sherana, also spelled EL SHARANA, rural community, north-central Northern Territory,

Australia. It serves as a base for uranium mining; the ore, discovered in 1953 and found in ridges far above the floor of the South Alligator River valley, is brought to the town for treatment and then taken by road 220 miles (350 km) northwest to Darwin. One of the largest (2,150 pounds [975 kg]) pieces of pitchblende, a uranium ore, ever found came from this mine. The community's name is derived from a combination of Ellen, Sharon, and Diana, daughters of one of the prospectors.

El Teniente, mining settlement, O'Higgins *región*, Machali commune central Chile. The site of the world's largest underground copper mine, El Teniente lies in the Andes about 60 miles (100 km) southeast of Santiago. It accounts for much of Chile's annual copper production. Copper is smelted at El Teniente and transported by rail to Rancagua. Molybdenum is found in association with the copper ores. El Teniente also has a hydroelectric plant.

El Tigre, city, central Anzoátegui *estado* ("state"), northeastern Venezuela situated in the highlands east of the Barcelona gap. The city is a commercial centre in the Oficina oil fields. Oil is piped 100 miles (160 km) north-northeastward to Puerto La Cruz, which produces some of Venezuela's domestically refined oil. El Tigre is also a transportation hub on the road linking Puerto La Cruz and Barcelona with Ciudad Bolívar, and it is the terminus of the highway running eastward along the southern flanks of the Andes from San Cristóbal, near the Colombian border. Pop. (2001 prelim.) 146,000.

El Yopal, also called YOPAL, town, *cabecera* (county seat) of Casanare *intendencia* ("intendency"), eastern Colombia. The original settlement (*caserío*) of El Yopal was founded in 1935 by Pedro Pablo González, and it has been the seat of Casanare intendency since the creation of Casanare in 1974. Located at the western edge of the Llanos ("Plains"), El Yopal has road connections to Sagamosa in the Cordillera Oriental. The local economy depends upon cattle raising and agriculture; the principal crops are rice, corn (maize), coffee, sugarcane, beans, plantains, and citrus fruits. Pop. (2003 prelim.) 57,148.

Elaeagnaceae, the oleaster family of dicotyledonous flowering plants, which together with the family Proteaceae constitutes the order Protocales. The oleaster family comprises three genera of shrubs and small trees of the Northern Hemisphere, especially in steppe and coastal regions.

The plants have a characteristic silvery or rusty-coloured sheen, produced by a covering of tiny, distinctive scales. Root nodules containing nitrogen-fixing bacteria are often associated with the roots. The flowers are radially symmetrical, bisexual or separately male and female, and lack petals but have a tubular structure of four sepals. The stamens (pollen-producing structures) occur in the same number as, or in twice the number of, sepals. The female structure, or pistil, is positioned above the attachment point of the other flower parts and is composed of one carpel (ovule-bearing structural unit) containing one ovule.

The genera are *Elaeagnus* (45 species), *Hippophae* (3 species), and *Shepherdia* (3 species). The order is considered to have evolutionary ancestors close to the order Myrtales.

Several shrubs of the order are cultivated ornamentally, especially the buffalo berry or silverberry (*Shepherdia argentea*), oleaster (*q.v.*: *Elaeagnus angustifolia*), and the sea buckthorn (*q.v.*: *Hippophae rhamnoides*). The berries of several species are edible.

elaenia (genus *Elaenia*), any of about 20 species of plain-coloured New World flycatchers, family Tyrannidae (order Passeriformes),

with a short bill and modest, ragged crest, usually concealing a white or yellow crown patch. Found in Central America, South America, and the West Indies, most species are olive above and have yellowish underparts. Field

Yellow-bellied elaenia (*Elaenia flavogaster*)

Drawing by John P. O'Neill

identification of species must often be based on distinctive vocal patterns. Some taxonomists place the yellow-crowned species in the genus *Myiopagis*.

Elagabalus, also spelled HELIOGABALUS, byname of CAESAR MARCUS AURELIUS ANTONINUS AUGUSTUS, original name VARIUS AVITUS BASSIANUS (b. 204, Emesa, Syria—d. 222), Roman emperor from 218 to 222, notable chiefly for his eccentric behaviour.

The family of his mother, Julia Soaemias, were hereditary high priests of the sun-god Baal at Emesa (in ancient Syria), worshiped in that locality under the name Elah-Gabal (thus Elagabalus). The emperor Caracalla (211–217), Bassianus' cousin, was murdered

Elagabalus, marble bust c. AD 221; in the Capitoline Museums, Rome

© A. Ad. de Luca/Corbis

in 217 and replaced by the praetorian prefect Macrinus. Bassianus' mother and his grandmother, Julia Macsa, won the support of the nearby troops by passing Bassianus off as an illegitimate son of Caracalla. Soon thereafter (218) the remainder of the Eastern armies deserted Macrinus.

Acknowledged as emperor by the Senate, Bassianus, by virtue of his priestly function, became generally known as Elagabalus. He imposed the worship of Baal upon the Roman world, executed a number of dissident generals, and pushed into high places many favourites distinguished by personal beauty and humble and alien origins. The homosexual orgies held openly by the young emperor

outraged Roman opinion. He was persuaded by Julia Maesa, the real power in the government, to adopt his docile cousin Alexander as his son and heir (221). When Elagabalus changed his mind and sought to depose Alexander, the Praetorian Guards mutinied, killed Elagabalus and his mother, and made Alexander emperor.

Elam, Elamite HALTAMI, Akkadian ELAMTU, also called SUSIANA, ancient country in southwestern Iran approximately equivalent to the modern region of Khūzestān. Four prominent geographic names within Elam are mentioned

Ruins of Susa, Elam, capital of the Achaemenian Empire during the reign of Darius I, 522–486 BC

By courtesy of Erich F. Schmidt, Oriental Institute, The University of Chicago

in ancient sources: Awan, Anshan, Simash, and Susa. Susa was Elam's capital, and in classical sources the name of the country is sometimes Susiana.

Throughout the late prehistoric periods, Elam was closely tied culturally to Mesopotamia. Later, perhaps because of domination by the Akkadian dynasty (c. 2334–c. 2154 BC), Elamites adopted the Sumero-Akkadian cuneiform script. Eventually Elam came under the control first of the Gutis, a mountain people of the area, and then of the 3rd dynasty of Ur. As the power of Ur in turn declined, the Elamites reasserted their independence.

In that turbulent period Elam's unique system of matrilinear succession emerged; sovereignty was hereditary through women, in that a new ruler was always "son of a sister" of some member of an older sovereign's family.

About 1600 BC new invaders of Mesopotamia, the Kassites, may have caused the fall of both Babylonia and Elam. Thereafter almost nothing is known of Elam until the latter part of the 13th century BC, when it began reemerging as a substantial international power. The Elamite kings Shutruk-Nahhunte and Kutir-Nahhunte invaded Mesopotamia and succeeded in securing a large number of ancient monuments (such as the Victory Stele of Naram-Sin and the stele bearing the law code of Hammurabi). Shilkhak-In-Shushinak campaigned vigorously, and for at least a short period his domain included most of Mesopotamia east of the Tigris River and reached eastward almost to Persepolis. This greatest period of Elamite conquest ended when Nebuchadrezzar I of Babylon (reigned c. 1124–c. 1103 BC) captured Susa. For almost 300 years thereafter nothing is known of Elamite history. In 640 BC, however, the Assyrian king Ashurbanipal invaded Elam, sacked Susa, and deported some of the leading citizens to Samaria in Palestine. Later Elam

formed a satrapy of the Achaemenian Empire, and Susa became one of the three most important cities of the Persian realm.

Elam's cultural accomplishments do not appear to have been extensive. Written business and governmental documents are limited in scope; still less is known of Elamite religious beliefs because no epic or religious materials in the Elamite language have been discovered. The language itself is not clearly understood and had no known ancient relatives and no modern descendants. Elam's art and architecture clearly derived much of its inspiration from Babylonia.

Elamite language, extinct language spoken by the Elamites in the ancient country of Elam, which included the region from the Mesopotamian plain to the Iranian Plateau. Elamite documents from three historical periods have been found. The earliest Elamite writings are in a figurative or pictographic script and date from the middle of the 3rd millennium BC. Documents from the second period, which lasted from the 16th to the 8th century BC, are written in cuneiform; the stage of the language found in these documents is sometimes called Old Elamite. The last period of Elamite texts is that of the reign of the Achaemenian kings of Persia (6th to 4th century BC), who used Elamite, along with Akkadian and Old Persian, in their inscriptions. The language of this period, also written in the cuneiform script, is often called New Elamite.

Although all three stages of Elamite have not been completely deciphered, a number of grammatical features of the language are known to scholars. These include a plural formation using the suffix *-p*, the personal pronouns, and the endings of several verb forms.

eland, either of two species of easily tamed, oxlike antelopes that constitute the genus *Taurotragus* of the family Bovidae (order Artiodactyla). They are found in herds on the open plains or in lightly wooded areas of central and southern Africa.

The largest of living antelopes, elands may stand up to 1.8 m (6 feet) at the shoulder and weigh as much as 1,000 kg (2,200 pounds).

Giant eland (*Taurotragus derbianus*)

Leonard Lee Rue III

They have a short, dark mane, a dewlap (flap of skin) hanging from the throat, and long horns twisted in a tight, screwlike spiral. The males have shorter, heavier horns than the females and have a tuft of dark hair on their foreheads. The common eland (*Taurotragus oryx*; also called the Cape, or Livingstone's, eland) is pale brown, becoming blue-gray with age, and is often marked with narrow, vertical white stripes. The giant, or Derby, eland (*T. derbianus*) is reddish brown with a blackish neck and vertical white striping. It has heavier, more widely divergent horns than the common eland. A subspecies, the western giant eland (*T. d. derbianus*), extinct in some of its former range, is considered endangered.

elapid, any of about 200 venomous species of the snake family Elapidae, characterized by short fangs fixed in the front of the upper jaw. Otherwise, elapids resemble the more abundant colubrids. Most species lay eggs; a few, chiefly in Australia, bear living young.

Elapids tend to be slender and agile. Most are small and inoffensive to humans, but the family also contains some of the largest and most lethal of snakes. An elapid strikes with a downward stab, followed by chewing. The venom is primarily neurotoxic but often contains substances that damage the body tissues or blood cells. The bite is relatively painless, but death from paralysis of the heart and lungs may be swift. Elapids occur in America, Africa, southern Asia, Pacific Islands, and Australia. About 60 species of elapids live in Australia.

For further information about elapid species and groups, see *bandy-bandy*; *black snake*; *brown snake*; *cobra*; *coral snake*; *krait*; *mamba*; *taipan*; *tiger snake*.

ELAS (National Popular Liberation Army; Greece): see *EAM-ELAS*.

Elasmotherium, also called GIANT UNICORN, extinct genus of rhinoceros found as a fossil in Pleistocene deposits in northern Eurasia (the Pleistocene Epoch began 1,600,000 years ago and ended 10,000 years ago). Its popular name derives from the very large horn on its forehead, which reached a length of about 2 m (more than 6 feet). *Elasmotherium* was much larger than any modern rhinoceros. The incisors had been lost, whereas the cheek teeth were well adapted to grazing. *Elasmotherium* is primarily known from skull parts; the remainder of the skeleton is poorly represented in the fossil record. Its ancestry has been traced to smaller forms of the preceding Pliocene Epoch (5.3 to 1.6 million years ago) found as fossils in China.

elastic fibre, any of the yellowish branching fibres composed primarily of the protein elastin, frequently arranged in plates or perforated membranes, as in the walls of the large arteries. Unlike collagenous fibres, they show no orderly fibrous subunits under microscopic examination but sometimes appear to be composed of minute fibrils around a solid core. Elastic fibres are not broken down by hot water, as are collagenous fibres; and they are resistant to most enzymes. As is suggested by their name, the fibres are highly elastic and impart elasticity to structures such as the skin, the lungs, and some large blood vessels, such as the aorta.

elastic wave, motion in a medium in which, when particles are displaced, a force proportional to the displacement acts on the particles to restore them to their original position. If a material has the property of elasticity and the particles in a certain region are set in vibratory motion, an elastic wave will be propagated. For example, a gas is an elastic medium (if it is compressed and the pressure is then released, it will regain its former volume), and sound is transmitted through a gas as an elastic wave.

elasticity, ability of a deformed material body to return to its original shape and size when the forces causing the deformation are removed. A body with this ability is said to behave (or respond) elastically.

To a greater or lesser extent, most solid materials exhibit elastic behaviour, but there is a limit to the magnitude of the force and the accompanying deformation within which elastic recovery is possible for any given material. This limit, called the elastic limit, is the maximum stress or force per unit area within a solid material that can arise before the onset of permanent deformation. Stresses beyond the elastic limit cause a material to yield or flow. For such materials the elastic limit marks the end of elastic behaviour and

the beginning of plastic behaviour. For most brittle materials, stresses beyond the elastic limit result in fracture with almost no plastic deformation.

The elastic limit depends markedly on the type of solid considered; for example, a steel bar or wire can be extended elastically only about 1 percent of its original length, while for strips of certain rubberlike materials, elastic extensions of up to 1,000 percent can be achieved. Steel is much stronger than rubber, however, because the tensile force required to effect the maximum elastic extension in rubber is less (by a factor of about 0.01) than that required for steel. The elastic properties of many solids in tension lie between these two extremes.

The different macroscopic elastic properties of steel and rubber result from their very different microscopic structures. The elasticity of steel and other metals arises from short-range interatomic forces that, when the material is unstressed, maintain the atoms in regular patterns. Under stress the atomic bonding can be broken at quite small deformations. By contrast, at the microscopic level, rubberlike materials and other polymers consist of long-chain molecules that uncoil as the material is extended and recoil in elastic recovery. The mathematical theory of elasticity and its application to engineering mechanics is concerned with the macroscopic response of the material and not with the underlying mechanism that causes it.

In a simple tension test, the elastic response of materials such as steel and bone is typified by a linear relationship between the tensile stress (tensile force per unit area of cross-section of the material), σ , and the extension ratio (difference between extended and initial lengths divided by the initial length), e . In other words, σ is proportional to e ; this is expressed $\sigma = Ee$, where E , the constant of proportionality, is called Young's modulus. The value of E depends on the material; the ratio of its values for steel and rubber is about 100,000. The equation $\sigma = Ee$ is known as Hooke's law and is an example of a constitutive law. It expresses, in terms of macroscopic quantities, something about the nature (or constitution) of the material. Hooke's law applies essentially to one-dimensional deformations, but it can be extended to more general (three-dimensional) deformations by the introduction of linearly related stresses and strains (generalizations of σ and e) that account for shearing, twisting, and volume changes. The resulting generalized Hooke's law, upon which the linear theory of elasticity is based, provides a good description of the elastic properties of all materials, provided that the deformations correspond to extensions not exceeding about 5 percent. This theory is commonly applied in the analysis of engineering structures and of seismic disturbances.

The linear theory of elasticity is not adequate for the description of the large deformations that can occur in rubber or in soft human tissue such as skin. The elastic response of these materials is nonlinear except for very small deformations and, for simple tension, can be represented by the constitutive law $\sigma = f(e)$, where $f(e)$ is a mathematical function of e that depends on the material and that approximates to Ee when e is very small. The term nonlinear means that the graph of σ plotted against e is not a straight line, by contrast with the situation in the linear theory. The energy, $W(e)$, stored in the material under the action of the stress σ represents the area under the graph of $\sigma = f(e)$. It is available for transfer into other forms of energy—for example, into the kinetic energy of a projectile from a catapult.

The stored-energy function $W(e)$ can be determined by comparing the theoretical relation between σ and e with the results of experimental tension tests in which σ and e

are measured. In this way, the elastic response of any solid in tension can be characterized by means of a stored-energy function. An important aspect of the theory of elasticity is the construction of specific forms of strain-energy function from the results of experiments involving three-dimensional deformations, generalizing the one-dimensional situation described above.

Strain-energy functions can be used to predict the behaviour of the material in circumstances in which a direct experimental test is impractical. In particular, they can be used in the design of components in engineering structures. For example, rubber is used in bridge bearings and engine mountings, where its elastic properties are important for the absorption of vibrations. Steel beams, plates, and shells are used in many structures; their elastic flexibility contributes to the support of large stresses without material damage or failure. The elasticity of skin is an important factor in the successful practice of skin grafting. Within the mathematical framework of the theory of elasticity, problems related to such applications are solved. The results predicted by the mathematics depend critically on the material properties incorporated in the strain-energy function, and a wide range of interesting phenomena can be modeled.

Gases and liquids also possess elastic properties since their volume changes under the action of pressure. For small volume changes, the bulk modulus, κ , of a gas, liquid, or solid is defined by the equation $P = -\kappa(V' - V_0)/V_0$, where P is the pressure that reduces the volume V_0 of a fixed mass of material to V' . Since gases can in general be compressed more easily than liquids or solids, the value of κ for a gas is very much less than that for a liquid or solid. By contrast with solids, fluids cannot support shearing stresses and have zero Young's modulus.

elastomer, any member of a class of polymeric substances that possess the quality of elasticity, *i.e.*, the ability to regain shape after deformation. Elastomers are the base material for all rubber products, both natural and synthetic, and for many adhesives.

A brief treatment of elastomers follows. For full treatment, see MACROPAEDIA: Industrial Polymers.

Polymers are chemical compounds whose molecules consist of several thousand smaller molecules, called monomers, that are linked together to form long chains. In elastic polymers these chains are highly flexible, disordered, and intertwined. In chemical terms, elastomers are extremely viscous fluids, lacking the rigidity of a glass or the ordered arrangement of a crystal. When stretched, the molecules are pulled into alignment and often take on aspects of a crystalline arrangement, but upon release they return spontaneously to their naturally disordered, entangled state. This return to natural disorder distinguishes elastomers from plastic polymers, which are normally glassy or crystalline and therefore retain much of the shape to which they are deformed.

Almost all elastomers are hydrocarbons; *i.e.*, they are composed principally of carbon and hydrogen and their compounds. Some occur naturally—*e.g.*, polyisoprene, which is formed in the latex of the rubber tree and is processed into natural rubber. Most elastomers, however, are produced synthetically from derivatives of petroleum and natural gas. Monomers such as isoprene, butadiene, and butylene are subjected to various polymerization reactions in which they are built up into large molecules. In many cases other chemical elements or compounds are incorporated into the polymer in order to modify basic properties—*e.g.*, chlorine in polychloroprene (neoprene) and sulfur in polyalkylene polysulfide (Thiokol), which contribute to the oil-resistance of these

rubbers. Properties can also be modified by producing elastomers as copolymers, *i.e.*, polymers made up of more than one type of monomer. Examples include nitrile rubber (an acrylonitrile-butadiene copolymer) and butyl rubber (a copolymer of isobutylene and isoprene). In another method, some elastomers are blended with various plastic polymers such as polypropylene or polystyrene; the resultant materials, known as thermoplastic elastomers, retain the resilience of rubber but can be remolded and reprocessed upon the application of heat (a property important in recycling).

In order to be made into useful rubber products, elastomeric materials must be subjected to various modifications. These include: strengthening of the material by cross-linking the polymer chains (for instance, by sulfur atoms in the process known as vulcanization); further strengthening by fillers such as carbon black; and treatment with chemicals that provide resistance to weathering and chemical attack. For fabrication into adhesives, elastomers are often dissolved in organic solvents and treated with various other additives to improve their application, adhesion, and durability.

Elat, also spelled ELATH, FLAT, or FLOTH, port city, southern extremity of Israel. It lies at the south tip of the Negev and at the head of the Gulf of Aqaba (Hebrew, Mifratz Elat), the eastern arm of the Red Sea. Al-Aqabah, Jordan, also located on the Gulf of Aqaba, lies 4 miles (7 km) to the southeast.

Elat is referred to several times in the Bible. In 1 Kings 9 it is told that King Solomon's ships sailed to the land of Ophir from Ezion-Geber "near Elath," bringing back a cargo of gold. The American archaeologist Nelson Glueck, who excavated the site of ancient Ezion-Geber (1940 and following), concluded that it and Elat were one and the same; the ruins are in Jordan just east of modern Elat.

Elat was a southern outpost of the Limes Palestinae, the line of border fortresses established by the Romans and the Nabataeans (Semitic tribes of ancient Arabia). It was a place of refuge for Jews fleeing the Muslim conquest of the Arabian Peninsula (7th century). In 1116 the town, known as Aila, was taken by the Crusaders. About 8½ miles (14 km) south is the islet of I Ha-Almuggim ("Coral Island"). Also known as the Isle de Graye, it has the ruins of a fortress marking the extreme southern extent of Crusader rule. The area fell to Saladin in 1167 and thereafter declined.

At the end of the British Palestine mandate (May 15, 1948) there was nothing on Elat's site but an abandoned frontier outpost called Umm Rashrāsh. In early 1949 the Israeli army advanced over 150 miles (240 km) from rear bases at Be'er Sheva (Beersheba) across the then roadless Negev and reached Israel's Red Sea coast at the site of Elat on March 10, 1949. This was the last operation of the Arab-Israeli War of 1948-49.

Modern Elat, founded in 1949 and incorporated in 1959, is Israel's only outlet to the Red Sea, Indian Ocean, and Far East. A small port was opened there in April 1951, and after the Sinai Campaign of 1956, when Egyptian control of the Strait of Tiran at the Gulf of Aqaba's entrance was broken, the port was much enlarged. It was again cut off in May 1967, when Egypt blockaded the strait. This action was a principal cause of the Six-Day War of June 1967. When the Suez Canal was closed (1967-75), the strait was reopened to the commerce of all nations and Elat again expanded. A new oil jetty was built with a pipeline connection to Ashqelon on the Mediterranean, then north to Haifa. Owing to the extreme heat and aridity of Elat, the Is-

raeli government granted special incentives to settlers willing to live there. Twenty years after its founding, the population had increased 25 times. Many of the city's residents found employment in the copper mines of nearby Timna until the mines closed in 1984. Elat is now linked with the more settled parts of Israel by improved highways and by regular air service. Its Red Sea coast, with clear waters, picturesque coral formations, and marine life, has been promoted as a tourist area; scuba diving is popular. Pop. (2002 est.) 42,100.

Elatinaceae, family of flowering plants, in the tea order (Theales), comprising two genera of mostly aquatic herbs. Members of the family have opposite or whorled leaves and small flowers with two to five overlapping petals. Waterwort (*Elatine hexandra*) and two similar species, *E. hydropiper* and *E. macropoda*, sometimes are grown in aquariums. These Eurasian plants tend to mat together as they grow. One species, *E. americana*, is widespread in northern North America. Species growing on bog edges or stream banks differ in form from those growing underwater.

The genus *Bergia*, with 25 tropical and temperate species, adapts to both aquatic and terrestrial situations. *B. capensis*, for example, has two types of roots—those on the aquatic form are green, contain chlorophyll, and float freely; those on the terrestrial form are white, stout, and branched.

Elaver River (France): see Allier River.

Elaziğ, city, eastern Turkey. It lies at the foot of a plateau overlooking a fertile plain. Originally founded as an Ottoman military garrison and administrative centre after the mid-19th century, the city grew rapidly as a result of its favourable location. Modern Elaziğ, surrounded by vineyards and orchards, is an important trading centre for the crops and livestock of the area; it is noted also for its wine. It is the home of the Euphrates University, founded in 1975. Pop. (2000) 266,495.

Elba, Latin *ILVA*, island off the west coast of Italy, in the Tyrrhenian Sea. Elba has an area of 86 square miles (223 square km) and is the largest island of the Tuscan Archipelago. It is famous as Napoleon's place of exile in 1814–15. Administratively Elba is part of Livorno *provincia*, Tuscany *regione*, Italy. Its coast is precipitous and its interior mountainous, rising to Mount Capanne (3,343 feet [1,019 m]).

The Etruscans mined iron ore at Elba, which was then called Aethalia ("Smoky Place") by the Greeks, probably because of the smelting furnaces. The Romans, who called it Ilva, also mined iron ore and established a naval base on the island. Elba was ruled by Pisa in the early Middle Ages, but it passed to Genoa in 1290 and in 1399 to the dukes of Piombino, who ceded it to Cosimo I de Medici of Florence in 1548. A portion of the island,

Cove along the rugged coast of Elba, Italy
G. Barone—Shostal

in Spanish hands from 1596 until 1709, was next ruled by Naples. In 1802 it was ceded to France, and, when Napoleon I abdicated in 1814, he was exiled to Elba. He arrived there on May 4. The island was recognized as an independent principality with Napoleon as its ruler until Feb. 26, 1815, on which day he returned to France for the Hundred Days. Thereafter Elba was restored to Tuscany, with which it passed to unified Italy in 1860.

Napoleon's chief residence, the Mulini Palace, overlooks the sea near Portoferraio, Elba's chief town, on the north coast. His summer residence, Villa San Martino, lies 4 miles (6 km) southwest and contains a museum and a collection of engravings.

Elba's mild climate supports a varied vegetation of Mediterranean type, with rich olive groves and vineyards. Traditional employment included anchovy, sardine, and tuna fishing as well as iron ore mining on the east coast. Tourism has now assumed increasing importance. Popular summer resorts are Procchio, Marciana Marina, Marciana, and those on the Gulf of Biodola in the north, Marina di Campo on the south coast, and Porto Azzurro, with its great Spanish fort (1602; now a prison), facing the mainland. The island has bus services and is connected by passenger and car ferry services with Piombino on the mainland.

Elbasan, town, central Albania. It lies on the north bank of the Shkumbin River, in the highlands at the eastern end of a fertile, well-watered plain. It was founded in 1466 by the Ottoman sultan Mehmed II, on the site of ancient Scampis, as a base for his military operations against the Albanian commander Skanderbeg. The town was a principal centre of Albanian nationalism during Ottoman rule. Until World War II about 85 percent of the populace was Muslim and most of the remainder Albanian Orthodox. Architectural remains of the former walled town are visible.

Cobble street in Elbasan, Alb.
Paolo Koch from Rapho/Photo Researchers

The trade centre of an olive-, corn- (maize-), and tobacco-growing region, Elbasan is linked by road and rail to the port of Durrës and other towns. The town's economic activities include timber processing, engineering works, and the production of cement, soap, and olive oil. Cërrik, a few miles to the southwest, has a petroleum refinery. Pop. (2001 est.) 97,200.

Elbe River, Czech *LABE*, river of central Europe and one of the continent's major waterways. It rises in the Krkonoše (Giant) Moun-

tains on the border of the Czech Republic and Poland and flows south and west in a wide arc across Bohemia. It then flows northwest across Germany and empties into the North Sea near Cuxhaven.

The following article is a brief treatment of the Elbe River. For full treatment, see *MACROPAEDIA: Europe*.

From 1945 to 1990 the Elbe River formed part of the boundary between East and West

The Elbe River winding through Germany

Germany. It is 724 miles (1,165 km) long, in places as wide as 9 miles (14 km), and has an average annual discharge of 25,074 cubic feet (710 cubic m) per second. Its major left-bank tributaries are the Vltava (Moldau), Ohře (Eger), and Mulde, and its right-bank tributaries are the Iser, Black Elster, Havel, and Alster. The Elbe is connected by the Elbe-Lübeck Canal with the Baltic Sea, by the Elbe-Havel Canal with the Havel River and Berlin, and by the Mittelland Canal with the Ruhr industrial region and the Rhine River; the canal network is an important transport route for exports. The 55,620-square-mile (144,060-square-km) drainage basin of the Elbe contains some of Germany's most important agricultural and industrial areas. The river is navigable for 1,000-ton barges as far upstream as Prague through the Vltava. The principal cities on the Elbe are Dresden, Wittenberg, Magdeburg, Hamburg, and Cuxhaven in Germany. Hamburg, located 55 miles (88 km) upstream from the mouth of the river, is one of the largest seaports on the continent of Europe.

Elbląg, German *ELBING*, former (1975–99) *województwo* (province), north-central Poland, now part of Warmińsko-Mazurskie (*q.v.*) province.

Elbląg, German *ELBING*, city, Warmińsko-Mazurskie *województwo* (province), north-central Poland. It lies along the Elbląg River near the Nogat River, which is the eastern mouth of the Vistula River. Founded in 1237 by the Teutonic Knights, the castle and settlement were granted town rights in 1246 and joined the Hanseatic League in the late 13th century. By 1580 it had become the chief East Prussian port in trade with England. Silting then obstructed Vistula Lagoon, reducing Elbląg to an inland port. In 1945 during World War II, a great deal of the town was destroyed by the Germans. Elbląg has subsequently been rebuilt, although work on rebuilding the old town portion of the city began only in 1991.

Elblag is a rail junction and port; its economy depends upon metallurgy, heavy-machinery manufacture (including turbines), sawmilling, brewing, and agriculture. The 99-mile- (159-kilometre-) long Elblag Canal, completed in 1872, connects Elblag with the inland port of Ostróda to the south. There is a branch of Gdańsk Technical University at nearby Zamech. Pop. (1990 est.) 125,200.

elbow, in human anatomy, hinge joint formed by the meeting of the humerus (bone of the upper arm) and the radius and ulna (bones of the forearm). The elbow allows the bending and extension of the forearm, and it also allows the rotational movements of the radius and ulna that enable the palm of the hand to be turned upward or downward.

The elbow forms from the expansion of the lower end of the humerus into two thick knobs, or condyles; the humerus' dome-shaped lateral condyle articulates with a shallow depression on the end of the radius, and the humerus' spool-shaped trochlea fits into a notch in the ulna. In addition, the edge of the radius' head fits into a shallow groove on the side of the ulna. The bending and extension of the elbow joint are achieved, respectively, by contractions of the biceps and triceps muscles. These movements chiefly involve only the humerus and ulna; rotation of the forearm involves the smaller radius bone as well.

The elbow is especially susceptible to stress injuries, although its surrounding capsule contains cushioning synovial membranes and is reinforced by ligaments. Thick lateral ligaments support the hinge action of the humerus-ulna junction, and a strong annular ligament around the upper part of the radius helps to hold that bone in place. These ligaments prevent the forward displacement of the forearm bones, but acute stresses can produce rearward dislocations of them. Attempts to force elbow movement past full extension of the arm (180 degrees) tear the joint's protective capsule, producing elbow sprains, while chronic and repeated stressful motions, such as the rotation of the forearm in some sports, can cause pain from overuse of the joint (tennis elbow).

Elbrus, Mount, Russian GORA ELBRUS, highest peak of the Caucasus mountains, southwestern Russia. It is an extinct volcano with twin cones reaching 18,510 feet (5,642 m) and 18,356 feet (5,595 m). The volcano was formed during the Upper Tertiary Period, more than 2,500,000 years ago. Sulfurous gases are still emitted on its eastern slopes, and there are many mineral springs along its descending streams. A total area of 53 square miles (138 square km) of Elbrus is covered by 22 glaciers, which feed the Kuban River and some of the headwaters of the Terek. Elbrus is a major centre for mountaineering and tourism in the Caucasus region. In 1964 an extensive tourist

and mountaineering base was opened, with large-scale sporting facilities.

Elburz Mountains, also spelled ALBORZ, ALBOURZ, ALBURZ, or ELBURS, Persian RESHTEH-YE KŪHHĀ-YE ALBORZ, major mountain range in northern Iran, 560 miles (900 km) long. The range, most broadly defined, extends in an arc eastward from the frontier with Turkmenistan southwest of the Caspian Sea to the Khorāsān region of northeastern Iran, southeast of the Caspian Sea, where the range merges into the Ālādāgh, the more southerly of the two principal ranges there. More commonly, however, the westernmost part of the range is called the Talish (Talysh, Talesh, or Tavālesh) Range, or the Bogrov Dāgh; the Elburz Range, in its strictest sense, forms part of the central stretch of the chain, which also includes Iran's two highest peaks, Mount Damāvand and Mount Alām. The Elburz mountain system traverses virtually all of the northernmost portions of Iran from east to west.

The Elburz chain is not as truly alpine (*i.e.*, resembling the European Alps) in its structure as is often suggested. On the one hand, continental conditions regarding sedimentation are reflected by thick Devonian sandstones (formed 345,000,000 to 395,000,000 years ago) and by Jurassic (136,000,000- to 190,000,000-year-old) shales containing coal seams. On the other hand, marine conditions are reflected by Permo-Carboniferous (225,000,000- to 345,000,000-year-old) strata that are composed mainly of limestones, as well as by very thick beds of green volcanic tuffs and lavas. Orogenic (mountain-building) phases of importance date from the younger Tertiary (Miocene and Pliocene epochs) Period (between 2,500,000 and 26,000,000 years ago). Over large areas they produced only a loose folding; but in the Central Elburz a number of folds were formed into blocks thrust mainly southward but in places northward, with cores made of Paleozoic rocks. Structurally and topographically, the Elburz system is less clearly defined on the southern than on the Caspian (northern) side of the chain, since various off-branching elements interconnect it on the southern side with the adjoining Iranian Plateau.

The Western Elburz Range runs south-southeastward for 125 miles (200 km). Varying in width from 15 to 20 miles (24 to 32 km), it consists of a single asymmetric ridge, the long slope facing the Caspian. Few of its peaks approach or exceed 10,000 feet (3,000 m) in height. There is a low pass west of Astārā, near the Turkmenistan frontier, 5,000 feet (1,500 m) above sea level. The Safid River, formed by the junction of the Qezel Owzan (Qisil Uzun) and Shāhrūd rivers, is the only river to cross the whole width of the chain: its gorge, giving access to the low pass of Qazvin, offers the best passage through the mountain chain, although by no means an easy one, between the Gilān region on the shores of the Caspian and the inland plateau to the south.

The Central Elburz is 250 miles (400 km) long. East of the longitude of Tehrān, which lies to the south of the range, it reaches a width of 75 miles (120 km). Located among the longitudinal valleys and ridges of the range are some important centres of settlement, with the towns of Deylamān, Razan, Kojūr, and Namar located on the Caspian side and Emāmshahr (formerly Shāhrūd), Lār, Damāvand, and Firūzkūh on the southern side. There are likewise many gorges, by which the rivers find their way down one or another of the slopes. Only two passes allow a relatively easy crossing in a single ascent—these are the Kandeḡān Pass, between the Karaj and the Chālūs rivers, and the Gadūk Pass, between the Hableh and the Tālā rivers. The main divide runs generally south of the highest crest, which—with the exception of the towering and isolated cone of the extinct volcano

Mount Damāvand (18,386 feet [5,604 m])—culminates in the glaciated massif of Takht-e Soleyman, which rises to more than 15,750 feet (4,800 m).

The Eastern, or Shāhkūh, Elburz runs about 185 miles (300 km) in a northeasterly direction. Since two ranges branch off on its southern side and no compensatory elements appear on the northern side, its width dwindles to less than 30 miles (48 km). With the exception of the Shāhkūh Range proper (which reaches an elevation of 12,359 feet [3,767 m]), the chain decreases in height toward the east. Longitudinal valleys are found less and less frequently east of the Shāhkūh. There are several passes at low elevations.

The Caspian and the inland, or southern, slopes of the Elburz differ markedly from each other in climatic and vegetational aspects. The Caspian slope has a distinctly humid climate, thanks to northerly air movements, enriched with moisture from the sea, which collide with the steep faces of the mountains to cause precipitation. This precipitation amounts to more than 40 inches (1,000 mm) annually in the lowlands of the Gilān region and is even more plentiful at higher elevations. Although it decreases toward the east, it still suffices to nourish a humid forest for the whole length of the chain on the Caspian side, where the soils are mostly of the brown-forest type. The natural vegetation of this slope grows in distinct zones: the luxuriant Hyrcanian forest on the lowest levels; a beech forest in the middle zone; and a magnificent oak forest from the elevation of 5,500 feet (1,700 m) up to the levels where gaps in the divide allow the moist air to overflow into the inland basins. In some sheltered valleys there are extensive stands of wild cypress; sheltered valleys adjacent to the Safid River constitute the only olive-growing areas of note in Iran.

The southern slope of the Elburz, by direct contrast, shares the arid character of the Iranian Plateau. Annual precipitation varies between 11 and 20 inches (280 and 500 mm) and is very irregular. The soils are mostly of the type associated with steppe (treeless, grassy, or shrubby) vegetation. The slope has become even more steppelike ever since the almost complete destruction of its original dry forest of junipers.

The Hyrcanian tigers for which the Caspian forests were famous are now very rare; but other wild cats, such as the leopard and the lynx, are still numerous in the Elburz. The bear, the wild boar, red and roe deer, the mouflon (wild mountain sheep), and the ibex are also present. Eagles and pheasants are notable among birds.

While large areas of the Elburz Mountains are almost uninhabited—some being occupied only by nomads and others having been depleted by Turkmen raids in the 19th century—there are still several well-settled districts, including Deylamān, Alāmūt, Tālaqān, and Lārjān (at the foot of Mount Damāvand). The landscape of the Caspian slopes is characterized by forest clearings with shingle-roofed loghouse villages and by lush fields and pastures. The landscape of the inland slopes is of the oasis type. Extensive grain cultivation occurs on both slopes, and cattle raising occurs on the Caspian side. Alpine pastures, seasonally dotted with flocks of sheep, cover an extensive zone yet higher. The land-distribution pattern prevailing in the Elburz includes a high proportion of peasant ownership. The holdings often are much-fragmented.

Many of the traditional ways of livelihood of the mountaineers, including charcoal burning (now prohibited because of devastation of the forests), the transportation of goods (especially of rice and of charcoal for Tehrān) by pack animals, and the working of hundreds of small

Mount Elbrus, highest peak of the Caucasus mountains

coal mines, have been displaced by the 20th-century modernization of Iran.

Apart from the main line of the trans-Iranian railroad, which links Tehrān with Bandar-e Torkeman via the Gadūk Pass, there are several asphalted roads across parts of the Elburz. From west to east, these run between Ardebil and Astārā, between Qazvin and Rasht, between Tehrān and Chālūs, between Tehrān and Āmol (via Damāvand); between Tehrān and Bābol (via Firūzkūh), and between Emāmshahr and Gorgān (via Kotal-e Zardāneh Pass).

The wild (natural or original) forests of the Elburz Mountains cover more than 8,000,000 ac (3,000,000 ha), of which some 3,000,000 ac can be exploited commercially for timber and other wood. There are also a few modern coal mines, as well as some deposits of iron and other ores. But most important is the water of the rivers, which is used for irrigation, for generating hydroelectric energy, and for supplying the fast-growing Tehrān. Spectacular dams have been built. These include the Safid Rūd Dam, used for the irrigation of the Safid Rūd Delta; the Karaj Dam and the Jarūd Dam, used mainly for supplying water to Tehrān and partly for irrigation; and a series of dams on other rivers of the Māzandarān *ostān* also used for irrigation.

Elcano, Juan Sebastián de (b. c. 1476, Guetaria, Vizcaya, Castile—d. Aug. 4, 1526, at sea), Basque navigator who completed the first circumnavigation of the Earth.

In 1519 he sailed as master of the "Concepción," one of five vessels in Ferdinand Magellan's fleet. On Magellan's death, which occurred in the Philippines in April 1521, Elcano took command of the expedition and brought it safely home to Spain despite scurvy, starvation, and harassment by the Portuguese. Only one ship of the five, the "Vittoria," with 17 other Europeans and 4 Indians aboard, reached Spain in September 1522. In 1525 Elcano, together with García Jofre de Loaisa, was appointed to the command of a fleet of seven ships and sent to claim the Moluccas for Charles V of Spain. Elcano died while crossing the Pacific.

Elche, town, Alicante province, in the autonomous community (region) of Valencia, southeastern Spain, on the Río Vinalopó just south of Alicante city. Of Iberian origin, the site was inhabited by Greeks, Carthaginians, and Romans (who named the town Ilici). Under Arab domination, the name was changed to Elx, whence Elche. A well-known example of 5th-century BC Iberian art, a polychrome stone statue known as "La dama de Elche" ("The Lady of Elche"), was found on a nearby archaeological site in 1897; a mosaic floor with Latin inscriptions was also uncovered there in 1959. A local custom—declared a national artistic monument in 1931—is observed annually on August 14–15 in the 17th-century church of Santa María with performances of the medieval drama *Misterio de Elche*, representing the Assumption of the Virgin.

Primary economic activity is based on the nearby El Palmeral (Palm Grove), of Carthaginian origin; it produces dates and fronds for export. Other fruits grown include pomegranates, figs, and olives. Elche

manufactures olive oil, soap, esparto fabrics, and hempen sandals (*alpargatas*). Pop. (1998 est.) 191,713.

Elcho Island (Australia): see Galiwinku.

Elda, city, Alicante province, in the autonomous community (region) of Valencia, southeastern Spain, northwest of Alicante city. Of ancient origin, Elda was called Idella by the Iberians, early peoples of Spain. The city first achieved importance under the Moors, who occupied it in the 8th century and built a castle (ruins remain); it was re-Christianized by James I of Aragon in 1265. In the 18th century Elda was given the title Fidelesima ("most faithful") by Philip V for its loyalty to the crown during the War of the Spanish Succession. Elda, connected by rail with Almansa and Alicante, is the centre of a fertile grain and fruit-producing area. Its manufactures include shoes, paper, furniture, and esparto fibre. Pop. (1998 est.) 52,500.

Eldad (BEN MAHLI) HA-DANI, English EL-DAD THE DANITE (fl. late 9th century), Jewish traveller and philologist who was generally credited with the authorship of a fanciful geographical narrative that exerted an enduring influence throughout the Middle Ages. This possibly gave rise to the legend of Prester John, the mighty Oriental priest-potentate of fabulous wealth and power.

Probably originally from southern Arabia, Eldad visited Mesopotamia, Egypt, North Africa, and Spain and caused a stir by his account of the Ten Lost Tribes of Israel (q.v.). He himself claimed to be a descendant of the Danites, who, together with the tribes of Naphtali, Asher, and Gad, were said to have established a Jewish kingdom in Cush (Kush), variously interpreted as Ethiopia or, roughly, present-day Sudan. His veracity was challenged largely because the ritual prescriptions he described diverged from those of the Talmud, the rabbinical compendium of law, lore, and commentary. His Hebrew narrative, *Sefer Eldad*, established his reputation as a philologist whom leading medieval Jewish grammarians and lexicographers quoted as an authority on linguistic difficulties. It appeared in several languages and in widely deviating versions. The first edition was published at the Italian city of Mantua in 1480.

Eldegüzid DYNASTY, also spelled ILDIGÜZID, ILDEGÜZID, ILDEGIZID, or ILDENIZID, (1137–1225), Iranian *atabeg* dynasty of Turkish origin that ruled in Azerbaijan (now divided between Iran and Azerbaijan).

The founder of the dynasty was Shams ad-Dīn Eldegüz (reigned c. 1137–75), originally a Turkish slave of the Seljuq minister Kamāl al-Mulk Simürümī. In 1137 the Seljuq sultan Mas'ūd I appointed Eldegüz ruler of the Seljuq provinces of Arrān and Azerbaijan. In 1161, shortly after he had married the widow of the Seljuq ruler Toghril II, Eldegüz was made *atabeg* (guardian) of his stepson, the infant Seljuq prince Arslan. During the next three decades the Eldegüzids, using their position as *atabegs* of Seljuq princes, expanded their territories in Iran as far south as Isfahan and northward in the Caucasus to the borders of Shirvān and Georgia. In 1191 the Seljuq sultan Toghril III defeated and subjugated Qutlugh Inanj (reigned 1191–95), the fourth Eldegüzid ruler. Qutlugh had to retreat to Azerbaijan, where the Eldegüzids held their position until 1225, when the Khwārezm-Shāh, Jalāl ad-Dīn Mingburnu, took over the administration of their territories.

elder, in Christianity, any of various church officers. In modern times the title of elder has been used notably in the Presbyterian and Reformed churches and in Mormonism.

In the early Christian Church the term elder (Hebrew *zaken*, Greek *presbyteros*), though possibly influenced by the use of the title for

secular magistrates in Asia Minor, was derived from the Israelites, who shared it with other Semitic peoples. Moses appointed 70 elders as intermediaries between himself and the people (Num. 11:16). In the New Testament, elders are mentioned together with bishops (*episcopoi*) as leaders of local churches; in some passages the two terms seem interchangeable. Later the word *presbyteros* came to mean "presbyter" (i.e., priest). It is thus difficult to decide on its exact significance in the early church. After the threefold ministry of bishop, priest, and deacon became fully adopted in the 2nd and following centuries, the office of elder lapsed in the Roman Catholic Church.

During the Reformation in the 16th century the office of elder was revived by certain churches, notably the Presbyterians. According to Presbyterian theory of church government, there are two classes of elders: the teaching elders, called ministers, ordained and especially set apart to the pastoral office, and the ruling elders, who are lay persons chosen generally by the congregation and ordained to assist the minister in the oversight and government of the church.

In the Church of Jesus Christ of Latter-day Saints, or Mormonism, an elder is a male member aged 20 or over. This church makes no distinctions between a layperson and a priest. At age 12, all worthy Mormon males become deacons; and before the age of 20 they become priests. At that age a man becomes an elder in the Melchizedek priesthood. In later life he may possibly rise to become a high priest, a member of the so-called seventy.

Among Methodists the term elder refers to a fully ordained minister. In the Lutheran Church the terms elder and deacon are often used interchangeably with reference to lay persons chosen by a congregation to assist the pastor in his official duties; they and the pastor form a board of elders, with advisory powers.

elder, any of about 20 to 30 species, mainly shrubs and small trees, comprising the genus *Sambucus* of the family Caprifoliaceae. Most are native to forested temperate or subtropical areas of both hemispheres. They are important as garden shrubs, as forest plants, and for their berries, which provide food for wildlife and are used for wines, jellies, pies, and medicines. An elder has divided leaves and flat, roundish clusters of tiny, yellowish white, saucer-shaped flowers that are followed by small red, blue-black, black, or yellow berries.

European red elder (*Sambucus racemosa*)

A.J. Huxley

The American, or sweet, elder (*S. canadensis*), of North America is the most important species horticulturally. It grows to 2.4 metres (8 feet) tall and produces large clusters of

white flowers, succeeded by abundant clusters of fruit. This fruit, called elderberry, is sometimes collected from wild trees, but a number of cultivated varieties have been developed for home and commercial use. The berries may be mixed with grapes for jelly or combined with apples as a pie filling. In some areas, the juice is traditionally fermented into wine. The unopened flower buds are sometimes pickled as a substitute for capers. In folk medicine, the elderberry has been touted as a remedy for stomach upsets, as an eye lotion, as a salve for bruises, and as a diuretic.

Other species of elders include the European, or black, elder (*S. nigra*), which reaches 9 m (29 feet), and the blue, or Mexican, elder (*S. caerulea*), which grows to 15 m (48 feet). European red elder (*S. racemosa*), native from northern Europe to North China, has round clusters of scarlet berries and reaches 4 m (13 feet). Red-berried elder (*S. pubens*), with dark pith, is a similar North American species. Danewört (*S. ebulus*), widespread in Europe and North Africa, is a perennial with annually herbaceous growth to 1 m (3 feet). Its clusters of black berries were once a source of dye.

Elder, John (b. March 8, 1824, Glasgow, Scot.—d. Sept. 17, 1869, London), Scottish marine engineer whose introduction of the compound steam engine on ships cut fuel consumption and helped make practical long voyages on which refueling was impossible.

The son of an inventor, Elder served a five-year apprenticeship with a Glasgow firm and then worked in engine factories in England. On his return to Scotland he joined a firm of millwrights, which later, as Randolph, Elder, and Company, entered the marine-engineering field. In 1854 he developed the marine compound steam engine (using both high and low pressures), which enabled seagoing vessels to save 30 to 40 percent of the coal they had been burning. As a partner and subsequently as sole owner of the business, he was an enlightened employer with a far-sighted attitude toward management-labour relations. In 1869 he was elected president of the Institute of Engineers and Shipbuilders of Glasgow.

Elder, Kate, also called **KATIE ELDER**, or **KATE FISHER**, byname **BIG NOSE KATE**, or **NOSEY KATE** (fl. 1877–81), plainswoman and frontier prostitute of the old American West, companion and possible wife of Doc Holliday (q.v.).

Nothing is known of her background before she turned up in a Fort Griffin, Texas, saloon in the fall of 1877, working as a barroom prostitute. There she met Holliday, with whom she had an affair and whom she helped to escape the law after he had knifed and killed a man in a brawl. Early in 1878 they made their way to Dodge City, Kan., where they took rooms as Dr. and Mrs. John H. Holliday; they claimed to have married and may have done so, though no proof exists.

They later moved on to Tombstone, Ariz., where in July 1881 an intoxicated Elder signed a deposition to the effect that John H. Holliday had been one of the outlaws who had lately tried to hold up the Benson stagecoach. Holliday was later freed of the charge, but he straightaway abandoned Elder.

Her subsequent life is unknown, although a late story, probably apocryphal, has Elder turning up in Bisbee, Ariz., in 1884/85. There in the Brewery Gulch saloon she was reportedly slain by a stray bullet fired by a drunk.

Eldon, John Scott, 1st Earl of, Viscount ENCOMBE of ENCOMBE, BARON ELDON OF ELDON (b. June 4, 1751, Newcastle upon Tyne, Northumberland, Eng.—d. Jan. 13, 1838, Hamilton Place, Middlesex), lord chancellor of England for much of the period between 1801 and 1827. As chief equity judge, he granted the injunction as a remedy more often than earlier lords chancellor had

generally done and settled the rules for its use. An inflexible conservative, he opposed Roman Catholic political emancipation, the

Eldon, detail of a portrait by Sir Thomas Lawrence; in the National Portrait Gallery, London

abolition of imprisonment as a punishment for debtors, the abolition of the slave trade, and the reform of the House of Commons.

Scott studied at University College, Oxford (B.A., 1770; M.A. 1773), and at the Middle Temple, London. Called to the bar in 1776, he entered the House of Commons in 1783. As attorney general from 1793, during the French revolutionary period, he was largely responsible for the measures that the ministry of William Pitt the Younger took to suppress political meetings and literature considered seditious. In 1799 he became chief justice of the Court of Common Pleas and was created Baron Eldon. Appointed lord chancellor by Prime Minister Henry Addington (afterward 1st Viscount Sidmouth), he served under five premiers from April 14, 1801, to April 12, 1827, except for 14 months in 1806–07. He resigned in protest against the Catholic Emancipation plan of George Canning, prime minister in 1827.

Always dilatory, the English chancery was thought to be at its worst in that respect during Eldon's tenure. He helped, however, to develop trademark law by issuing numerous injunctions against merchants who sold goods bearing the name of other traders. In 1821 King George IV created him Viscount Encombe and Earl of Eldon.

Eldorado (Spanish: "The Gilded One"), originally, the legendary ruler of an Indian town near Bogotá, who was believed to plaster his naked body with gold dust during festivals, then plunge into Lake Guatavita to wash off the dust after the ceremonies; his subjects threw jewels and golden objects into the lake. Spanish conquistadores heard the tale before 1530, and one of them reported that he had visited Eldorado himself in a city called Omagua. In 1538 Spaniards from Peru and Germans from Venezuela converged on the Bogotá highlands in search of the "gilded man." No trace of him was found, but the area remained under Spanish rule.

As the search continued into the Orinoco and Amazon valleys, Eldorado came to mean an entire fabulous country of gold, with legendary cities named Manoa and Omagua. In this quest, Gonzalo Pizarro crossed the Andes from Quito (1539), Francisco de Orellana sailed down the Napo and the Amazon (1541–42), and Gonzalo Jiménez de Quesada explored eastward from Bogotá (1569–72). Sir Walter Raleigh searched for Manoa in the Orinoco lowlands (1595), while Spaniards sought Omagua nearby. In 1603 the Portuguese Pêro Coelho de Sousa explored northward from Pernambuco, and the golden city of Eldorado was shown on maps of Brazil and the Guianas for years thereafter.

Eldorado was only one of the many mythical regions of great riches—Cibola, Quivira, the City of the Caesars, and Otro Méiico being

among the others. The search for these led to the rapid exploration and conquest of much of the Americas by Spaniards and others. Since then, Eldorado has come to mean any place where wealth can be quickly and easily gained. The name was given to towns in Latin America and the United States and to a California county. The story is often mentioned in literature, as in Milton's *Paradise Lost* and Voltaire's *Candide*.

Eldoret, town, western Kenya, eastern Africa, on the Uasin Gishu Plateau west of the Great Rift Valley. Situated at an elevation of 6,857 feet (2,090 m) above sea level, its healthful climate attracted many European settlers during the colonial period. It serves an agricultural area; chief crops are corn (maize), wheat, and pyrethrum (a plant used in manufacturing insecticides). Cattle raising in the vicinity is important. Local industries include flour-milling and food-processing plants. Eldoret is a rail stop on the line running northwest into Uganda. It is the seat of a Roman Catholic bishopric. Pop. (1983 est.) 55,300.

Eldridge, (David) Roy, byname **LITTLE JAZZ** (b. Jan. 30, 1911, Pittsburgh, Pa., U.S.—d. Feb. 26, 1989, Valley Stream, N.Y.), American trumpeter, one of the great creative musicians of the 1930s.

A child prodigy, Eldridge began his professional career in 1917 when, on New Year's Eve, he played the drums in his elder brother's band. He went to New York City in 1930 and played in the trumpet sections of bands led by Cecil Scott, Elmer Snowden, and Teddy Hill. His style was influenced by that of saxophonist Coleman Hawkins. By the time he was playing with Hill at the Savoy Ballroom in New York City's Harlem, in 1935, Eldridge was developing into an improviser of magnificent power and invention. The following year he joined the Fletcher Henderson orchestra, then in its last days, and his recordings from that period show him to be one of the great creative musicians of the decade. He also appears on a few of the historic small-group recordings with the singer Billie Holiday, and from time to time he had bands of his own.

Eldridge's fame suddenly flowered in 1941 when he joined Gene Krupa's band, and it was further increased in 1944 when he joined Artie Shaw. Later, he toured with Jazz at the Philharmonic and other jazz concert groups all over the world, retiring in 1980. Stylistically he became one of the key figures of jazz trumpet playing, representing a link between the classical style of Louis Armstrong and the fierce departures of Dizzy Gillespie, who testified to Eldridge's influence upon him.

Eldridge broke away from the traditional conception involving figures that were most natural to the trumpet (arpeggiated lines and sustained tones) and generated a technically difficult approach resembling jazz saxophone improvisation; very fast, scalelike passages. In addition, he incorporated harmonically unorthodox choices of notes and leaps into the high register (he loved to hear a note squeal and crack), which provided the basis for Dizzy Gillespie's enormously influential modern jazz trumpet style.

Elea (Greek city-state): see **Elis**.

Elea, also spelled **HYELE**, Roman **VELIA**, ancient city in Lucania, Italy, about 25 miles southeast of Paestum; home of the Eleatic school of philosophers, including Parmenides and Zeno. The city was founded about 535 BC by Phocaean Greek refugees on land seized from the native Oenotrians. Unlike other Greek cities in Italy, Elea was never captured by the Lucanians; it became a Roman ally around 275 and a *municipium* in 90–89 BC. Elea, finally deserted in medieval times be-

cause of Arab raids, has extensive ruins that include sanctuaries, houses, the outline of the complete wall circuit, and a medical centre.

Eleanor of Aquitaine, also called **ELEANOR OF GUYENNE**, French **ÉLÉONORE**, or **ALIÉNOR**, **D'AQUITAINE**, or **DE GUYENNE** (b. c. 1122—d. April 1, 1204, Fontevault, Anjou, Fr.), queen consort of both Louis VII of France (in 1137–52) and Henry II of England (in 1152–1204) and mother of Richard I the Lion-Heart and John of England. She was perhaps the most powerful woman in 12th-century Europe.

Eleanor was the daughter and heiress of William X, duke of Aquitaine and count of Poitiers, who possessed one of the largest domains in France—larger, in fact, than those held by the French king. Upon William's death in 1137 she inherited the Duchy of Aquitaine and in July 1137 married the heir to the French throne, who succeeded his father, Louis VI, the following month. Eleanor became queen of France, a title she held for the next 15 years. Beautiful, capricious, and adored by Louis, Eleanor exerted considerable influence over him, often goading him into undertaking perilous ventures.

From 1147 to 1149 Eleanor accompanied Louis on the Second Crusade to protect the fragile Latin kingdom of Jerusalem, founded after the First Crusade only 50 years before, from Turkish assault. Eleanor's conduct during this expedition, especially at the court of her uncle Raymond of Poitiers at Antioch, aroused Louis's jealousy and marked the beginning of their estrangement. After their return to France and a short-lived reconciliation, their marriage was annulled in March 1152. According to feudal customs, Eleanor then regained possession of Aquitaine, and two months later she married the grandson of Henry I of England, Henry Plantagenet, count of Anjou and duke of Normandy. In 1154 he became, as Henry II, king of England, with the result that England, Normandy, and the west of France were united under his rule. Eleanor had only two daughters by Louis VII; to her new husband she bore five sons and three daughters. The sons were William, who died at the age of three; Henry; Richard, the Lion-Heart; Geoffrey, duke of Brittany; and John, surnamed Lackland until, having outlived all his brothers, he inherited, in 1199, the crown of England. The daughters were Matilda, who married Henry the Lion, duke of Saxony and Bavaria; Eleanor, who married Alfonso VIII, king of Castile; and Joan, who married successively William II, king of Sicily, and Raymond VI, count of Toulouse. Eleanor would well have deserved to be named the "grandmother of Europe."

During her childbearing years, she participated actively in the administration of the realm and even more actively in the management of her own domains. She was instrumental in turning the court of Poitiers, then frequented by the most famous troubadours of the time, into a centre of poetry and a model of courtly life and manners. She was the great patron of the two dominant poetic movements of the time: the courtly love tradition, conveyed in the romantic songs of the troubadours, and the historical *matière de Bretagne*, or "legends of Brittany," which originated in Celtic traditions and in the *Historia regum Britanniae*, written by the chronicler Geoffrey of Monmouth some time between 1135 and 1139.

The revolt of her sons against her husband in 1173 put her cultural activities to a brutal end. Since Eleanor, 11 years her husband's senior, had long resented his infidelities, the revolt may have been instigated by her, in any case, she gave her sons considerable military support. The revolt failed, and Eleanor was

captured while seeking refuge in the kingdom of her first husband, Louis VII. Her semi-imprisonment in England ended only with the death of Henry II in 1189. On her release, Eleanor played a greater political role than ever before. She actively prepared for Richard's coronation as king, was administrator of the realm during his crusade to the Holy Land, and, after his capture by the Duke of Austria on Richard's return from the east, collected his ransom and went in person to escort him to England. During Richard's absence, she succeeded in keeping his kingdom intact and in thwarting the intrigues of his brother John Lackland and Philip II Augustus, king of France, against him.

In 1199 Richard died without leaving an heir to the throne, and John was crowned king. Eleanor, nearly 80 years old, fearing the disintegration of the Plantagenet domain, crossed the Pyrenees in 1200 in order to fetch her granddaughter Blanche from the court of Castile and marry her to the son of the French king. By this marriage she hoped to insure peace between the Plantagenets of England and the Capetian kings of France. In the same year she helped to defend Anjou and Aquitaine against her grandson Arthur of Brittany, thus securing John's French possessions. In 1202 John was again in her debt for holding Mirebeau against Arthur, until John, coming to her relief, was able to take him prisoner. John's only victories on the Continent, therefore, were due to Eleanor.

She died in 1204 at the monastery at Fontevault, Anjou, where she had retired after the campaign at Mirebeau. Her contribution to England extended beyond her own lifetime; after the loss of Normandy (1204), it was her own ancestral lands and not the old Norman territories that remained loyal to England. She has been misjudged by many French historians who have noted only her youthful frivolity, ignoring the tenacity, political wisdom, and energy that characterized the years of her maturity. "She was beautiful and just, imposing and modest, humble and elegant"; and, as the nuns of Fontevault wrote in their necrology: a queen "who surpassed almost all the queens of the world."

(R. Pe.)

BIBLIOGRAPHY. Amy Kelly, *Eleanor of Aquitaine and the Four Kings* (1950), is a major work with complete notes and a good bibliography and sources. H.G. Richardson, "The Letters and Charters of Eleanor of Aquitaine," *English Historical Review*, 74:193–213 (1959), adds some unpublished sources to those gathered by Amy Kelly. Régine Pernoud, *Aliénor d'Aquitaine* (1965), gives more attention to the personality and politics of Eleanor herself, independently from the history of her two husbands.

Eleanor of Castile, Spanish **LEONOR DE CASTILLA** (b. 1246—d. Nov. 28, 1290, Harby, Nottinghamshire, Eng.), queen consort of King Edward I of England (ruled 1272–1307). Her devotion to Edward helped bring out his best

ter qualities; after her death, his rule became somewhat arbitrary. Eleanor was the daughter of King Ferdinand III of Castile and his wife, Joan of Ponthieu.

In 1254 Eleanor was married to Lord Edward, son of England's King Henry III. In honour of the event, her half brother, Alfonso X of Castile, transferred to Edward his claims to Gascony. When Henry III's baronial opponents seized power in England in 1264, Eleanor was sent for safety to France; she returned in October 1265, after Edward had crushed the rebels.

Eleanor accompanied Edward on a crusade from 1270 to 1273. The story that she saved his life at Acre (now in Israel) by sucking poison from a dagger wound is evidently apocryphal. After Edward ascended the throne, Eleanor was criticized for allegedly mistreating the tenants on her lands. Upon her death, Edward erected the famous Eleanor Crosses—several of which still stand—at each place where her coffin rested on its way to London.

Eleanor of Provence, French **ÉLÉONORE DE PROVENCE** (b. 1223—d. June 25, 1291, Amesbury, Wiltshire, Eng.), queen consort of King Henry III of England (ruled 1216–72); her widespread unpopularity intensified the severe conflicts between the King and his barons.

Eleanor's father was Raymond Berengar IV, count of Provence, and her mother was the daughter of Thomas I, count of Savoy. The marriage of Eleanor and Henry (January 1236) was designed to further the King's continental ambitions. Eleanor soon alienated the barons by having her Savoyard and Provençal uncles installed in high offices in England.

After rebel barons captured Henry and took over the government in May 1264, Eleanor became the leader of the royalist exiles in France. She raised an invasion force, but her fleet was wrecked at Sluis, Flanders. Nevertheless, the rebels were crushed in August 1265, and Eleanor then returned to England. Upon the death of Henry and the accession of her son Edward I, she retired to a nunnery at Amesbury.

Eleaticism (from Elea, or Velia, a Greek colony in southern Italy), one of the principal schools of ancient Pre-Socratic philosophy, distinguished by its radical monism, according to which all that is really true is a static plenum of Being and nothing exists that stands either in contrast or in contradiction to it; and by its stress on the coalescence of existence, thought, and expression.

A brief treatment of Eleaticism follows. For full treatment, see **MACROPAEDIA: Philosophical Schools and Doctrines**.

As a result of Aristotle's systematizing, Xenophanes of Colophon has often been counted as the founder of the Eleatic school; but its chief tenets undoubtedly appear first in Parmenides. Zeno of Elea was the pupil of Parmenides; and Melissus was the third and last leader of the school.

A summary of certain features in Parmenides' doctrine will explain its outstanding importance to philosophy. It argues that reality is one undifferentiated whole; the "things" and their changes that we observe through our senses are mere appearances or names. He claimed that Being is one (Greek *hen*) and unique and that it is continuous, indivisible, and all that there is or ever will be (the Eleatic One). Aristotle further elaborated Parmenides' argument to assert that Being must be all there is—since other than Being there is only Not-Being—and Not-Being cannot divide Being from Being. It follows, therefore, that Being is whole, continuous, and "not divisible, since it is all alike."

In opposition to the Ionian natural philosophers who accepted the reality of change but looked for material stuff underlying it, Parmenides' position was reached by an abstract,

Eleanor of Castile, detail of an electrotype from an effigy in Westminster Abbey, in the National Portrait Gallery, London

logical, or generalized analysis of what we mean by "to be." He was therefore correctly regarded as the founder of metaphysics. His use of the law of contradiction meant the introduction of logic as the prime method of philosophy.

Melissus defended him along the same lines, while Zeno's work forms a complement by defending him negatively or indirectly, through a *reductio ad absurdum* of his opponents' position. With Zeno, however, the analysis focuses less on Being than on the coextensive term Unity. He may have intended to deal with the pluralism of Pythagoreans, whose materialization of numbers made them specially aware that plurality implied units. Here was the weak point of Eleaticism, and it was noticed by Gorgias and by Plato: the absurdities demonstrated in the alleged units of the pluralists had only to be turned against the unitary reality of the Eleatics.

By Plato's time the heirs of Zeno were so-called Megarian thinkers, who concentrated on logical puzzles involved in the notions of predication, contradiction, possibility, and motion; we can see how they compelled Plato to attend to purely logical matters in the *Euthydemus*, *Parmenides*, and *Sophist*. The influence of the Eleatic school was due, in fact, to the very generality of its analysis. Melissus' remark, that if there were a "many" these would have to be like the Eleatic One and not as they appear, was acceptable to Democritus and to Plato alike. The properties of the atom were almost certainly suggested by those of "the one." The Eleatic or monistic strand in Plato is conspicuous in the Neoplatonists and, through their medium, was to be consciously woven by G.W.F. Hegel into his objective idealism.

Eleazar ben Azariah (fl. late 1st and early 2nd centuries AD), Jewish rabbinic scholar, one of the Palestinian tannaim (those who compiled the Jewish Oral Law), whose practical maxims constitute some of the best-known sayings of the Talmud.

Eleazar ben Judah OF WORMS, original name ELEAZAR BEN JUDAH BEN KALONYMOS, also called ELEAZAR ROKEAH (b. c. 1160, Mainz, Franconia [Germany]—d. 1238, Worms), Jewish rabbi, mystic, Talmudist, and codifier. Along with the *Sefer Hasidim* (1538; "Book of the Pious"), which he coauthored, his voluminous works are the major extant documents of medieval German Hasidism (an ultrapietist sect that stressed prayer and mysticism). His greatest work is his ethical code *Rokeah* (1505; "Dealer in Spice"), for which he is sometimes known as Eleazar Rokeah. The work explains mystical concepts, including the unity of God, in terms of Halakha (Law).

election, the formal process of selecting a person for public office or accepting or rejecting a political proposition, by voting. The widespread use of elections in the modern world has its origins in the gradual emergence of representative government in Europe and North America since the 17th century.

A brief treatment of elections follows. For full treatment, see MACROPAEDIA: Political Systems.

Elections are the means by which the people in a society make political choices by voting for competing candidates or parties. They are used both in the selection of leaders and in the determination of issues. The concept of elections implies that the voters are presented with alternatives and can choose among a number of proposals (or their advocates) designed to settle an issue of public concern. The presence of alternatives is a necessary condition, for though electoral forms may be used to demonstrate popular support for incumbent leaders and their policies, the absence of alternatives disqualifies such devices as genuine elections.

In representative democracies, periodic and regularly scheduled elections serve not only to select leaders but also to hold those leaders accountable for their performance. Such elections, moreover, force candidates or parties to expose their record of accomplishment and future intentions to public scrutiny in election campaigns and thus serve as forums for the discussion of public issues and permit an exchange of influence between the governors and the governed. By mobilizing voters in a common act of governance, elections lend authority and legitimacy to the acts of those who wield power in the name of the people.

There are various systems of translating voter preferences into representation. The simplest is the plurality rule, in which a candidate can win an election merely by polling more votes than any other single opponent. Under the majority rule, the party or candidate winning more than 50 percent of the votes is awarded the contested seat or office; he thus must poll more votes than the combined opposition. A critical difficulty with the majority formula is that, in a multiparty political system, the formula may produce an electoral deadlock if no candidate secures 50 percent of the total vote. In order to break such deadlocks, a second election is held to enable one candidate to collect a majority of the votes.

Neither the majority nor the plurality formula distributes legislative seats in proportion to the share of the popular vote won by the competing parties; both tend to award the strongest party disproportionately and to handicap the weaker parties. A third system, proportional representation, is designed to remedy this defect, chiefly through the use of ballots that allow the voters to rank competing candidates (or parties) in order of preference.

elector, German KURFÜRST, prince of the Holy Roman Empire who had a right to participate in the election of the emperor (the German king). Beginning around 1273 and with the confirmation of the Golden Bull of 1356, there were seven electors: the archbishops of Trier, Mainz, and Cologne; the duke of Saxony; the count palatine of the Rhine; the margrave of Brandenburg; and the king of Bohemia. Other electorates were created later for Bavaria (1623–1778), Hanover (from 1708), and Hesse-Kassel (from 1803). The office disappeared with the abolition of the empire in 1806.

electoral college, the system by which the president and vice president of the United States are chosen. It was devised by the framers of the United States Constitution to provide a method of election that was feasible, desirable, and consistent with a republican form of government.

History and operation. During most of the Constitutional Convention, presidential selection was vested in the legislature. The electoral college was proposed near the end of the convention by the Committee on Unfinished Parts, chaired by David Brearley of New Jersey, to provide a system that would select the most qualified president and vice president. Historians have suggested a variety of reasons for the adoption of the electoral college, including concerns about the separation of powers and the relationship between the executive and legislative branches, the balance between small and large states, slavery, and the perceived dangers of direct democracy. One supporter of the electoral college, Alexander Hamilton, argued that while it might not be perfect, it was "at least excellent."

Article II, Section I of the Constitution stipulated that states could select electors in any manner they desired and in a number equal to their congressional representation (senators plus representatives). (The Twenty-Third Amendment, adopted in 1961, provided electoral college representation for Washington, D.C.) The electors would then meet and vote

for two people, at least one of whom could not be an inhabitant of their state. Under the original plan, the person receiving the largest number of votes, provided it was a majority of the number of electors, would be elected president, and the person with the second largest number of votes would become vice president. If no one received a majority, the presidency of the United States would be decided by the House of Representatives, voting by states and choosing from among the top five candidates in the electoral vote. A tie for vice president would be broken by the Senate. Despite the Convention's rejection of a direct popular vote as unwise and unworkable, the initial public reaction to the electoral college system was favourable. The major issue of concern regarding the presidency during the debate over ratification of the Constitution was not the method of selection but the president's unlimited eligibility for reelection.

The development of national political parties toward the end of the 18th century provided the new system with its first major challenge. Informal congressional caucuses, organized along party lines, selected presidential nominees. Electors, chosen by state legislatures mostly on the basis of partisan inclination, were not expected to exercise independent judgment when voting. So strong were partisan loyalties in 1800 that all the Democratic-Republican electors voted for their party's candidates, Thomas Jefferson and Aaron Burr. Since the framers had not anticipated party-line voting and there was no mechanism for indicating a separate choice for president and vice president, the tie had to be broken by the Federalist-controlled House of Representatives. The election of Jefferson after 36 ballots led to the adoption of the Twelfth Amendment in 1804, which specified separate ballots for president and vice president and reduced the number of candidates from which the House could choose from five to three.

The development of political parties coincided with the expansion of popular choice. By 1836 all states selected their electors by direct popular vote except South Carolina, which did so only after the American Civil War. In choosing electors, most states adopted a general-ticket system in which slates of partisan electors were selected on the basis of a statewide vote. Thus, the winner of a state's popular vote would win its entire electoral vote. Only Maine and Nebraska have chosen to deviate from this method, instead allocating electoral votes to the victor in each House district and a two-electoral-vote bonus to the statewide winner. The winner-take-all system generally favoured major parties over minor parties, large states over small states, and cohesive voting groups concentrated in large states over those that were more diffusely dispersed across the country.

Arguments for and against the electoral college. One of the most troubling aspects of the electoral college system is the possibility that the winner might not be the candidate with the most popular votes. Three presidents—Rutherford B. Hayes in 1876, Benjamin Harrison in 1888, and George W. Bush in 2000—were elected with fewer popular votes than their opponents, and Andrew Jackson lost to John Quincy Adams in the House of Representatives after winning a plurality of the popular and electoral vote in 1824. In 18 elections between 1824 and 2000, presidents were elected without popular majorities—including Abraham Lincoln, who won election in 1860 with under 40 percent of the national vote. During much of the 20th century, however, the effect of the general-ticket system was to exaggerate the popular vote, not reverse it. For example, in 1980 Ronald Reagan won just over 50 percent of the popular vote and 91

percent of the electoral vote; in 1988 George Bush received 53 percent of the popular vote and 79 percent of the electoral vote; and in 1992 and 1996 William J. Clinton won 43 and 49 percent of the popular vote, respectively, and 69 and 70 percent of the electoral vote. Third-party candidates with broad national support are generally penalized in the electoral college—as was Ross Perot, who won 19 percent of the popular vote in 1992 and no electoral votes—though candidates with geographically concentrated support—such as Dixiecrat candidate Strom Thurmond, who won 39 electoral votes in 1948 with just over 2 percent of the national vote—are occasionally able to win electoral votes.

The divergence between popular and electoral votes indicates some of the principal advantages and disadvantages of the electoral college system. Many who favour the system maintain that it provides presidents with a special federative majority and a broad national mandate for governing, unifying the two major parties across the country and requiring broad geographic support to win the presidency. In addition, they argue that the electoral college protects the interests of small states and sparsely populated areas, which they claim would be ignored if the president was directly elected. Opponents, however, argue that the potential for an undemocratic outcome—in which the winner of the popular vote loses the electoral vote—the bias against third parties and independent candidates, the disincentive for voter turnout in states where one of the parties is clearly dominant, and the possibility of a “faithless” elector who votes for a candidate other than the one to whom he is pledged make the electoral college outmoded and undesirable. Many opponents advocate eliminating the electoral college altogether and replacing it with a direct popular vote. Their position has been buttressed by public-opinion polls, which regularly show that Americans prefer a popular vote to the electoral college system. Other possible reforms include a district plan, similar to those used in Maine and Nebraska, which would allocate electoral votes by legislative district rather than at the statewide level; and a proportional plan, which would assign electoral votes on the basis of the percentage of popular votes a candidate received. Supporters of the electoral college contend that its longevity has proven its merit and that previous attempts to reform the system have been unsuccessful.

In 2000 George W. Bush's narrow 271–266 electoral college victory over Albert Gore, who won the nationwide popular vote by more than 500,000 votes, prompted renewed calls for the abolition of the electoral college. Doing so, however, would require adopting a constitutional amendment by a two-thirds vote of both chambers of Congress and ratification by three-fourths of the states. Because many smaller states fear that eliminating the electoral college would reduce their electoral influence, adoption of such an amendment is considered difficult and unlikely. (S.J.W.)

Electoral Commission (1877), commission created by the U.S. Congress to resolve the disputed 1876 presidential election between Republican Rutherford B. Hayes and Democrat Samuel J. Tilden. Preliminary returns showed Tilden with 184 electoral votes of the 185 needed to win, while Hayes had 165. Twenty electoral votes were in doubt: all those from Florida, Louisiana, and South Carolina and one from Oregon (initially given to Tilden).

The election impasse continued until December 6, the appointed date for electors to meet in the states. When Congress convened the following day there were rival reports from the states. Six weeks of maneuvering and acri-

mony followed, punctuated by threats of civil war. On Jan. 29, 1877, Congress created an Electoral Commission to judge the contests, and the Commission was given “the same powers, if any,” possessed by Congress, and its decisions were to be final unless rejected by both houses.

The Commission had five members from the House of Representatives, five from the Senate, and four from the Supreme Court. The congressional and court contingents were divided evenly between Republicans and Democrats, and the four associate justices were to name a fifth, tacitly but universally understood to be David Davis, an independent from Illinois. However, Davis was elected by the Republican-controlled legislature of Illinois to that state's vacant Senate seat. Thereupon, the four justices picked their colleague Joseph P. Bradley, a Republican whose record made him acceptable to the Democrats.

Republican pressure swayed Bradley from favouring Tilden's convincing claim to the Florida vote, which went to Hayes. Thereafter all votes followed on a straight party-line basis. (Hayes's claim to Oregon was clearly legitimate, and fraud and intimidation by both parties had been widespread in Louisiana and South Carolina.) The final vote was reported to Congress on February 23, and a tumultuous congressional session, which elected Hayes, convened on March 1 to count the electoral vote. The verdict was received bitterly by Democrats in the North and philosophically by those in the South, who had been promised by Hayes's allies that federal troops would be removed promptly from the former Confederate states, as they were before the end of April.

Electra (Greek: “Bright One”), in Greek legend, the daughter of Agamemnon and Clytemnestra, who saved the life of her young brother Orestes by sending him away when their father was murdered. When he later returned, she helped him to slay their mother

Electra and Orestes killing Aegisthus in the presence of their mother, Clytemnestra; detail of a Greek vase, 5th century bc

The Mansell Collection

and their mother's lover. Electra then married Orestes' friend Pylades. The plays of the same name written by Sophocles and Euripides and the *Choephoroi* by Aeschylus vary the theme in detail. Many other versions also exist, including Eugene O'Neill's play *Mourning Becomes Electra* (1931).

electret, material that retains its electric polarization after being subjected to a strong electric field. The positive charge within the material becomes permanently displaced in the direction of the field, and the negative charge becomes permanently displaced in the direction opposite to the field. One end of the electret is somewhat positive, and the other is somewhat negative, though the net charge remains zero. Electrets are prepared from certain waxes, plastics, and ceramics, the individual molecules of which are permanently polarized but are randomly arranged before being subjected to an electric field so that there is no overall polarization in the material. The strong electric field (approximately 1,000,000 volts per metre) rotates the polar molecules into an alignment that persists when the exter-

nal field is removed. Sometimes electrets are made by allowing a molten material to solidify in a strong electric field.

The behaviour of electrets in an electric field is analogous to that of permanent magnets in a magnetic field. An electret, for example, lines up in an electric field with its positive end pointing in the direction of the field. Electrets, discovered in 1925, have found applications in electrostatic microphones.

electric arc, continuous, high-density electric current between two separated conductors in a gas or vapour with a relatively low potential difference, or voltage, across the conductors. The high-intensity light and heat of arcs are utilized in welding, in carbon-arc lamps and arc furnaces that operate at ordinary air pressure, and in low-pressure sodium-arc and mercury-arc lamps.

electric automobile, battery-powered motor vehicle, originating in the late 1880s and used for private passenger, truck, and bus transportation.

Through the early period of the automotive industry until about 1920, electric automobiles were competitive with petroleum-fueled cars particularly as luxury cars for urban use and as trucks for deliveries at closely related points, for which the relatively low speed and limited range, until battery recharge, were not detrimental. Electrics, many of which were steered with a tiller rather than a wheel, were especially popular for their quietness and low maintenance costs. Ironically, the death knell of the electric car was first tolled by the Kettering electrical self-starter, first used in 1912 Cadillacs and then increasingly in other gasoline-engine cars. Mass production, led by Henry Ford, also reduced the cost of the non-electrics. Electric trucks and buses survived into the 1920s, later than passenger cars, especially in Europe.

Electric automobile prototypes reappeared in the 1960s when major U.S. manufacturers, faced with ultimate exhaustion of petroleum-based fuels and with immediate rising fuel costs from the domination of Arab petroleum producers, once again began to develop electrics. Both speed and range were increased, and newly developed fuel cells offered an alternative to batteries; but by the mid-1980s electric automobiles had not become a part of the automotive industry's output. Most industrial in-plant carrying and lifting vehicles, however, were electrically powered.

electric catfish (*Malapterurus electricus*), widely distributed freshwater catfish native to tropical Africa. The only member of the family Malapteruridae, it is a thickset fish with six mouth barbels and a single fin (the adipose fin) on its back, just anterior to the rounded tail fin. It is brownish or grayish, irregularly spotted with black, and attains a length and weight of about 1.2 metres (4 feet) and 23 kilograms (51 pounds).

Electric catfish (*Malapterurus electricus*)

Douglas Faulkner

The electric catfish is capable of generating and controlling the discharge of up to 450 volts of electricity. It uses its power to defend itself and to capture prey. The electric organ

is composed of modified muscle tissue and forms a fine, gelatinous layer directly beneath the soft, naked skin of the fish. The electric catfish is hardy and, though pugnacious, is sometimes kept in home aquariums. It was pictured on tombs by the ancient Egyptians.

electric charge, quantity of electricity that flows in electric currents or that accumulates on the surfaces of dissimilar nonmetallic substances that are rubbed together vigorously. Electric charge, a basic property of matter, occurs in discrete natural units and is neither created nor destroyed.

Electric charges are of two general types: positive and negative. Two objects that have an excess of one type of charge exert a force of repulsion on each other when relatively close together. Two objects that have excess opposite charges, one positively charged and the other negatively charged, attract each other when relatively near. *See* Coulomb force.

Many fundamental, or subatomic, particles of matter have the property of electric charge. For example, electrons have negative charge and protons have positive charge, but neutrons have zero charge. The negative charge of each electron is found by experiment to have the same magnitude, which is also equal to that of the positive charge of each proton. Charge thus exists in natural units equal to the charge of an electron or a proton, a fundamental physical constant. A direct and convincing measurement of an electron's charge, as a natural unit of electric charge, was first made (1911) in the Millikan oil-drop experiment (*q.v.*). Atoms of matter are electrically neutral because their nuclei contain the same number of protons as there are electrons surrounding the nuclei. Electric current and charged objects involve the separation of some of the negative charge of neutral atoms. Current in metal wires consists of a drift of electrons of which one or two from each atom are more loosely bound than the rest. Some of the atoms in the surface layer of a glass rod positively charged by rubbing it with a silk cloth have lost electrons, leaving a net positive charge owing to the unneutralized protons of their nuclei. A negatively charged object has an excess of electrons on its surface.

Electric charge is conserved: in any isolated system, in any chemical or nuclear reaction, the net electric charge is constant. The algebraic sum of the fundamental charges remains the same. *See* charge conservation.

The unit of electric charge in the metre-kilogram-second and SI systems is the coulomb, equivalent to the net amount of electric charge that flows through a cross section of a conductor in an electric circuit during each second when the current has a value of one ampere. One coulomb consists of 6.24×10^{18} natural units of electric charge, such as individual electrons or protons. One electron itself has a negative charge of $1.60217733 \times 10^{-19}$ coulomb. In the centimetre-gram-second system there are two units of electric charge: the electrostatic unit of charge, esu, or statcoulomb; and the electromagnetic unit of charge, emu, or abcoulomb. One coulomb of electric charge equals 3,000,000,000 esu, or one-tenth emu.

An electrochemical unit of charge, the faraday, is useful in describing electrolysis reactions, such as in metallic electroplating. One faraday equals 9.6485309×10^4 coulombs, the charge of a mole of electrons (that is, an Avogadro's number, 6.0221367×10^{23} , of electrons).

electric circuit, path for transmitting electric current. An electric circuit includes a device that gives energy to the charged particles constituting the current, such as a battery or a generator; devices that use current, such as lamps, electric motors, or electronic computers; and the connecting wires or transmission lines. Two of the basic laws that mathematically describe the performance of electric cir-

cuits are Ohm's law and Kirchoff's circuit rules (*qq.v.*).

Electric circuits are classified in several ways. A direct-current circuit carries current that flows only in one direction. An alternating-current circuit carries current that pulsates back and forth many times each second, as in most household circuits. A series circuit

Representative circuit connections (Top) Resistors connected in series; (bottom) batteries connected in parallel

comprises a path along which the whole current flows through each component (*see* illustration, top). A parallel circuit comprises branches so that the current divides and only part of it flows through any branch. The voltage, or potential difference, across each branch of a parallel circuit is the same, but the currents may vary. In a home electrical circuit, for instance, the same voltage is applied across each light or appliance, but each of these loads draws a different amount of current, according to its power requirements. A number of similar batteries connected in parallel (*see* illustration, bottom) provides greater current than a single battery, but the voltage is the same as for a single battery. *See also* integrated circuit; tuned circuit.

The network of transistors, transformers, capacitors, connecting wires, and other electronic components within a single device such as a radio is also an electric circuit. Such complex circuits may be made up of one or more branches in combinations of series and series-parallel arrangements.

electric current, any movement of electric charge carriers, such as subatomic charged particles (*e.g.*, electrons having negative charge, protons having positive charge), ions (atoms that have lost or gained one or more electrons), or holes (electron deficiencies that may be thought of as positive particles).

Electric current in a wire, where the charge carriers are electrons, is a measure of the quantity of charge passing any point of the wire per unit of time. In alternating current (*q.v.*) the motion of the electric charges is periodically reversed; in direct current (*q.v.*) it is not. In many contexts the direction of the current in electric circuits is taken as the direction of positive charge flow, the direction opposite to the actual electron drift. When so defined the current is called conventional current.

Current in gases and liquids generally consists of a flow of positive ions in one direction together with a flow of negative ions in the opposite direction. To treat the overall effect of the current, its direction is usually taken to be that of the positive charge carrier. A current of negative charge moving in the opposite direction is equivalent to a positive charge of the same magnitude moving in the

conventional direction and must be included as a contribution to the total current. Current in semiconductors consists of the motion of holes in the conventional direction and electrons in the opposite direction.

Currents of many other kinds exist, such as beams of protons, positrons, or charged pions and muons in particle accelerators.

Electric current generates an accompanying magnetic field, as in electromagnets. When an electric current flows in an external magnetic field, it experiences a magnetic force, as in electric motors. The heat loss, or energy dissipated, by electric current in a conductor is proportional to the square of the current.

A common unit of electric current is the ampere, a flow of one coulomb of charge per second, or 6.2×10^{18} electrons per second. The centimetre-gram-second units of current are either the electrostatic unit of charge (esu) per second or the absolute electromagnetic unit (abamp). One abamp equals 10 amperes; one ampere equals 3×10^9 esu per second.

electric dipole, pair of equal and opposite electric charges the centres of which are not coincident. An atom in which the centre of the negative cloud of electrons has been shifted slightly away from the nucleus by an external electric field constitutes an induced electric dipole. When the external field is removed, the atom loses its dipolarity. A water molecule (H_2O), in which two hydrogen atoms stick out on one side and form together with the oxygen atom as vertex a 105° angle, constitutes a permanent electric dipole. The oxygen side of the molecule is always somewhat negative and the hydrogen side somewhat positive. An electric dipole may be large, too, such as a long straight wire used as a radio transmitting antenna on which electrons are impelled back and forth, making one end negative and the other positive with reversal of polarity every half cycle.

In an electric field a dipole undergoes a torque, tending to rotate so that its axis becomes aligned with the direction of the electric field. The amount of torque, greatest when the dipole is at right angles to the electric field, depends not only on the strength of the electric field but also on the separation of the two electric charges and their magnitude. If each charge has a magnitude q and the distance from the centre of the negative charge to that of the positive charge is d , the product qd is defined as the electric dipole moment. Its magnitude indicates the maximum torque exerted upon a given electric dipole per unit value of the surrounding electric field in a vacuum. The electric dipole moment, a vector, is directed along the line from negative charge toward positive charge. Dipole moments tend to point along the direction of the surrounding electric field.

Because electric dipole moment has dimensions of electric charge times displacement, its unit in the metre-kilogram-second system is the coulomb-metre; in the centimetre-gram-second system it is the esu-centimetre.

electric discharge lamp, also called VAPOUR LAMP, lighting device consisting of a transparent container within which a gas is energized by an applied voltage and thereby made to glow. The French astronomer Jean Picard observed (1675) a faint glow in a mercury-barometer tube when it was agitated, but the cause of the glow (static electricity) was not then understood. The Geissler tube of 1855, in which gas at low pressure glowed when subjected to an electrical voltage, demonstrated the principle of the electric discharge lamp. After practical generators were devised in the 19th century, many experimenters applied electric power to tubes of gas. From about 1900, practical electric discharge lamps were in use in Europe

and the United States. The French inventor Georges Claude was the first to use neon gas, about 1910. Mercury vapour in a neon lamp gives a bluish light; mercury is used also in fluorescent lamps and some ultraviolet lamps. Helium in amber glass glows gold; blue light in yellow glass shows green; combinations of gases give white light.

The sodium-vapour lamp, developed about 1931 in Europe, is a good illuminant if the yellow colour of its light is acceptable.

The glow lamp, used as an indicator or a night-light, contains a high-resistance filament in a small bulb. The voltage difference between plates at the ends of this filament causes the enclosed gas, usually neon or argon, to glow faintly. It uses little power and lasts a long time. Because the glow discharge tends to keep the voltage across the lamp constant, it is sometimes used as a voltage regulator. See also arc lamp; fluorescent lamp.

electric displacement, auxiliary electric field or electric vector that represents that aspect of an electric field associated solely with the presence of separated free electric charges, purposely excluding the contribution of any electric charges bound together in neutral atoms or molecules. If electric charge is transferred between two originally uncharged parallel metal plates, one becomes positively charged and the other negatively charged by the same amount, and an electric field exists between the plates. If a slab of insulating material is inserted between the charged plates, the bound electric charges comprising the internal structure of the insulation are displaced slightly, or polarized; bound negative charges (atomic electrons) shift a fraction of an atomic diameter toward the positive plate, and bound positive charges shift very slightly toward the negative. This shift of charge, or polarization, reduces the value of the electric field that was present before the insertion of the insulation. The actual average value of the electric field E , therefore, has a component P that depends on the bound polarization charges and a component D , electric displacement, that depends on the free separated charges on the plates. The relationship among the three vectors D , E , P in the metre-kilogram-second (mks) or SI system is: $D = \epsilon_0 E + P$ (ϵ_0 is a constant, the permittivity of a vacuum). In the centimetre-gram-second (cgs) system the relationship is: $D = E + 4\pi P$.

The value of the electric displacement D may be thought of as equal to the amount of free charge on one plate divided by the area of the plate. From this point of view D is frequently called the electric flux density, or free charge surface density, because of the close relationship between electric flux and electric charge. The dimensions of electric displacement, or electric flux density, in the metre-kilogram-second system are charge per unit area, and the units are coulombs per square metre. In the centimetre-gram-second system the dimensions of D are the same as those of the primary electric field E , the units of which are dynes per electrostatic unit, or statvolts per centimetre.

electric eel (*Electrophorus electricus*), eel-shaped South American fish of the family Electrophoridae capable of producing an electric shock strong enough to stun a human. Despite its name, the fish is not a true eel but is related to characins in the order Cypriniformes. It is a sluggish creature, inhabiting slow, fresh water and periodically surfacing to gulp air from which it absorbs oxygen for respiration.

Long, cylindrical, scaleless, and gray-brown, the electric eel sometimes reaches a length of 2.75 m (9 feet) and a weight of 22 kg (49 pounds). Dorsal and caudal fins are rudimen-

Electric eel (*Electrophorus electricus*)

tary, but the tail region (about four-fifths the total length) is bordered below by a long anal fin, undulations of which enable the fish to move about. The tail region also contains the electric organs, which are derived from muscle tissue and innervated by spinal nerves. The shock is used mainly to immobilize fish and other prey; it can be discharged at will and can measure up to 650 volts.

electric eye: see photoelectric cell.

electric field, region around an electric charge in which an electric force is exerted on another charge. Instead of considering the electric force as a direct interaction of two electric charges at a distance from each other, one charge is considered the source of an electric field that extends outward into the surrounding space,

Electric field lines near equal but opposite charges

From R. Resnick and D. Halliday, *Physics, Parts I & II*, copyright 1966, by permission of John Wiley & Sons, Inc.

and the force exerted on a second charge in this space is considered as a direct interaction between the electric field and the second charge. The strength of an electric field E at any point may be defined as the electric force F exerted per unit positive electric charge q at that point, or simply $E = F/q$. If the second, or test, charge is twice as great, the resultant force is doubled; but their quotient, the measure of the electric field E , remains the same at any given point. The strength of the electric field depends on the source charge, not on the test charge. Strictly speaking, the introduction of a small test charge, which itself has an electric field, slightly modifies the existing field. The electric field may be thought of as the force per unit positive charge that would be exerted before the field is disturbed by the presence of the test charge.

The direction of the force that is exerted on a negative charge is opposite that which is exerted on a positive charge. Because an electric field has both magnitude and direction, the direction of the force on a positive charge is chosen arbitrarily as the direction of the electric field. Because positive charges repel each other, the electric field around an isolated positive charge is oriented radially outward. When they are represented by lines of force, or field lines, electric fields are depicted as starting on positive charges and terminating on negative charges. The lines indicate the

path that a small positive test charge would take if it were placed in the field. A line tangent to a field line indicates the direction of the electric field at that point. Where the field lines are close together, the electric field is stronger than where they are farther apart. The magnitude of the electric field around an electric charge, considered as source of the electric field, depends on how the charge is distributed in space. For a charge concentrated nearly at a point, the electric field is directly proportional to the amount of charge; it is inversely proportional to the square of the distance radially away from the centre of the source charge and depends also upon the nature of the medium. The presence of a material medium always diminishes the electric field below the value it has in a vacuum.

Thus, each point in space has an electric property associated with it, the magnitude and direction of which are expressed by the value of E , called electric field strength, or electric field intensity, or simply the electric field. Knowledge of the value of the electric field at a point without any specific knowledge of what produced the field is all that is needed to determine what will happen to electric charges close to that particular point.

At times the electric field itself may become detached from the source charge, as in the case of charges accelerating up and down the transmitting antenna of a television station. The electric field with an accompanying magnetic field is propagated through space as a radiated wave at the same speed as that of light. Such electromagnetic waves indicate that electric fields are generated not only from electric charges but also from changing magnetic fields.

The value of the electric field has dimensions of force per unit charge. In the metre-kilogram-second and SI systems, the appropriate units are newtons per coulomb, equivalent to volts per metre. In the centimetre-gram-second system, the electric field is expressed in units of dynes per electrostatic unit (esu), equivalent to statvolts per centimetre.

electric furnace, heating chamber with electricity as the heat source for achieving very high temperatures to melt and alloy metals and refractories. The electricity has no electrochemical effect on the metal but simply heats it.

Modern electric furnaces generally are either arc furnaces or induction furnaces. A third type, the resistance furnace, is still used in the production of silicon carbide and electrolytic aluminum; in this type, the furnace charge (i.e., the material to be heated) serves as the resistance element. In one type of resistance furnace, the heat-producing current is introduced by electrodes buried in the metal. Heat also may be produced by resistance elements lining the interior of the furnace.

Electric furnaces produce roughly two-fifths of the steel made in the United States. They are used by specialty steelmakers to produce almost all the stainless steels, electrical steels, tool steels, and special alloys required by the chemical, automotive, aircraft, machine-tool, transportation, and food-processing industries. Electric furnaces also are employed, exclusively, by mini-mills, small plants using scrap charges to produce reinforcing bars, merchant bars (e.g., angles and channels), and structural sections.

The German-born British inventor Sir William Siemens first demonstrated the arc furnace in 1879 at the Paris Exposition by melting iron in crucibles. In this furnace, horizontally placed carbon electrodes produced an electric arc above the container of metal. The first commercial arc furnace in the United States was installed in 1906; it had a capacity of four tons and was equipped with two electrodes. Modern furnaces range in heat size from a few tons up to 400 tons, and the arcs

strike directly into the metal bath from vertically positioned, graphite electrodes. Although the three-electrode, three-phase, alternating-current furnace is in general use, single-electrode, direct-current furnaces have been installed more recently.

Coreless-type electric induction furnace

From H.M. Rowan, "Selecting the Right Unit for Efficient Induction Melting," Inductotherm Corp. Rancocas, N.J.

In the induction furnace, a coil carrying alternating electric current surrounds the container or chamber of metal. Eddy currents are induced in the metal (charge), the circulation of these currents producing extremely high temperatures for melting the metals and for making alloys of exact composition.

electric generator, also called **DYNAMO**, any machine that converts mechanical energy to electricity for transmission and distribution over electrical power networks or for use in trains, ships, aircraft, and automobiles.

A brief treatment of electric generators follows. For full treatment, see **MACROPAEDIA: Energy Conversion**.

Electric generators transform mechanical energy from various sources, as, for example, wind turbines, water turbines at dams, steam turbines driven by steam produced with heat from the combustion of fossil fuels or from nuclear fission, and internal-combustion engines (diesel engines and gas-turbine engines in particular). The construction and speed of generators vary according to the characteristics of the mechanical prime mover employed. The underlying principles of operation of an electric generator are the same as those for an electric motor—namely, Ampère's law and Faraday's law of induction (see also **electric motor**). In an electric motor, the flow of energy is simply reversed, with electrical energy undergoing conversion to mechanical energy.

In most cases, generators that supply electrical power networks produce alternating current (AC), which reverses polarity at a fixed frequency (generally 50 or 60 cycles per second). Several generators are usually connected into a power network and must operate at the same frequency for simultaneous power generation. Such machines are called synchronous generators or, sometimes, alternators.

The first practical electric generator was built by the French engineer and inventor Zénobe-Théophile Gramme during the late 1860s. This so-called Gramme dynamo contributed significantly to the general acceptance of electricity as a useful form of energy.

electric heater, device for heating rooms that converts electric current to heat by means of resistors that emit radiant energy. Resistors may be composed of metal-alloy wire,

nonmetallic carbon compounds, or printed circuits. Heating elements may have exposed resistor coils mounted on insulators, metallic resistors embedded in refractory insulation and encased in protective metal, or a printed circuit encased in glass. Fins may be used to increase the area that dissipates the heat.

Electric heaters also are used for domestic central heating and for materials processing in industry (see **heat pump**; **electric furnace**).

In an electron tube, an electric heating element shaped in the form of a wire or ribbon is used to supply heat to a cathode; the element provides heat when a current is passed through it.

electric motor, any of a class of devices that convert electrical energy to mechanical energy, usually by employing electromagnetic phenomena such as the coupling between the electrical and mechanical systems.

A brief treatment of electric motors follows. For full treatment, see **MACROPAEDIA: Energy Conversion**.

The electric motor is the complement of the electric generator, a device that transforms mechanical energy into electrical energy (see also **electric generator**). In general, generators may function as motors, and, conversely, motors may function as generators; they differ only in some construction details and their auxiliary equipment.

The operation of an electric motor involves two general principles. The first, called Ampère's law, states that a conductor experiences a force if a component of an electric current in that conductor flows at right angles to a magnetic field. The second principle, Faraday's law of induction, holds that a potential difference exists between the ends of a conductor if that conductor is given a component of motion perpendicular to the magnetic field.

Given these principles, every electric motor must have two basic components: a rotor and a stator. The rotor, which in most cases comprises the moving part, contains conductors to produce and shape magnetic fields that will interact with magnetic fields generated by the stator. In addition, the rotor has a contacting device (e.g., slip rings) to connect it electrically with the external circuit, as well as various other mechanisms, including a drive shaft with which it transmits mechanical power to another machine. The stator is made of similar magnetic materials and electrical conductors that serve to establish and shape magnetic fields.

Electric motors are commonly classified into two broad types, depending on whether direct or alternating current is used. These general types may be subdivided into induction motors, synchronous motors, and commutator motors, based on the way in which the magnetic fields are controlled.

An induction motor typically has two sets of insulated wire windings: one, usually on the stator, is connected to an external power source; the other, on the rotor, consists of continuous wire loops. The magnetic field established when currents flow in these conductors is concentrated in a narrow air gap between the stator and the rotor. The purpose of the windings connected to the external energy source is to produce a rotating field that interacts with the induced currents in the rotor conductors, thereby establishing forces on those conductors. The revolving field can only be created if there are at least two windings that carry currents that are not in phase (i.e., whose waves are not at maximum magnitude simultaneously).

Alternating-current induction motors basically are constant-speed devices and are most frequently used as such. They are the most widely employed electric motors because of their simple construction, efficiency, and low cost. Moreover, they are extremely rugged and in the smaller sizes (under 25 horsepower) can

generally withstand a sudden application of full voltage at standstill without damage.

Like induction motors, synchronous devices operate on the principle of a rotating magnetic field. In most cases the stator produces this field. The rotor serves to generate a constant unidirectional field by energizing a direct-current winding from a direct-current source (usually of 125 or 250 volts). This field interacts with the rotating field. In small synchronous motors, it is possible to eliminate the need for a direct-current power source by constructing the stator from metals used for permanent magnets. In such a case, the stator is given a permanent residual magnetic field that locks in with the rotating field at synchronous speed. These so-called hysteresis motors have a lower power-to-weight ratio than motors energized by direct current, but they are useful in certain low-load applications where constant speeds are crucial—e.g., gyros-pin motors employed in navigational equipment, tape recorders, and electric clocks.

Direct-current commutator motors, commonly regarded as forerunners of induction and synchronous devices, utilize a stationary field instead of a rotating field. Such a motor consists of a field magnet (stationary magnet), an armature (rotor coil), and a commutator, which is a mechanism that reverses the direction of the current in the armature. The armature turns between the poles of the field magnet until its own poles are next to the opposite poles of the magnet. At this point the direction of the current flowing through the armature is reversed, enabling the armature to make another half-turn. As the armature revolves, it produces torque, the turning force of the motor. One variety of direct-current commutator device, the series motor, is able to produce very high torque under heavy load, making it useful for traction applications.

The development of the electric motor can be traced to the work of the Danish scientist Hans Christian Ørsted in the early 19th century, when he discovered that electricity in motion generates a magnetic field. In seeking to demonstrate the converse of this finding, the English physicist and chemist Michael Faraday constructed a primitive model of the electric motor in 1821. By the early 1870s the Belgian-born electrical engineer Zénobe-Théophile Gramme had developed the first commercially viable electric motor. In 1883 the Serbian-American engineer Nikola Tesla invented the first alternating-current induction motor, a device generally considered the prototype of the modern electric motor.

The electric motor has become the dominant motive power for industrial, business, transportation, and household applications. Not only are electric motors able to meet diverse service requirements, as, for example, accelerating, braking, and holding a load, but they can be made in a wide variety of sizes with output ranging from a fraction of a watt to thousands of horsepower.

electric organ (musical instrument): see **electronic organ**.

electric polarization, slight relative shift of positive and negative electric charge in opposite directions within an insulator, or dielectric, induced by an external electric field. Polarization occurs when an electric field distorts the negative cloud of electrons around positive atomic nuclei in a direction opposite the field. This slight separation of charge makes one side of the atom somewhat positive and the opposite side somewhat negative. In some materials whose molecules are permanently polarized by chemical forces, such as water molecules, some of the polarization is caused by molecules rotating into the same alignment under the influence of the electric

field. One of the measures of polarization is electric dipole moment, which equals the distance between the slightly shifted centres of positive and negative charge multiplied by the amount of one of the charges. Polarization P in its quantitative meaning is the amount of dipole moment p per unit volume V of a polarized material, $P = p/V$.

electric potential, the amount of work needed to move a unit charge from a reference point to a specific point against an electric field. Typically, the reference point is the Earth, although any point beyond the influence of the electric field charge can be used.

Forces acting on a positive charge in an electric field
Encyclopædia Britannica, Inc.

The diagram shows the forces acting on a positive charge q located between two plates, A and B, of an electric field E . The electric force F exerted by the field on the positive charge is $F = qE$; to move the charge from plate A to plate B, an equal and opposite force ($F' = -qE$) must then be applied. The work W done in moving the positive charge through a distance d is $W = F'd = -qEd$.

The potential energy for a positive charge increases when it moves against an electric field and decreases when it moves with the electric field; the opposite is true for a negative charge. Unless the unit charge crosses a changing magnetic field, its potential at any given point does not depend on the path taken.

Although the concept of electric potential is useful in understanding electrical phenomena, only differences in potential energy are measurable. If an electric field is defined as the force per unit charge, then by analogy an electric potential can be thought of as the potential energy per unit charge. Therefore, the work done in moving a unit charge from one point to another (e.g., within an electric circuit) is equal to the difference in potential energies at each point. In the International System of Units (SI), electric potential is expressed in units of joules per coulomb (i.e., volts), and differences in potential energy are measured with a voltmeter.

electric power, energy generated through the conversion of other forms of energy, such as mechanical, thermal, or chemical energy. Electric energy is unrivaled for many uses, as for lighting, computer operation, motive power, and entertainment applications. For other uses it is competitive, as for many industrial heating applications, cooking, space heating, and railway traction.

A brief treatment of electric power follows. For full treatment, see MACROPAEDIA: Energy Conversion.

For statistical data on production and consumption of electrical energy, see BRITANNICA WORLD DATA in the current *Britannica Book of the Year*.

Electric power is the product of current and voltage. A given value of power can be produced by endless combinations of current and voltage values. If the current is direct, electrons progress always in the same direction through the device receiving power. If the current is

alternating, electrons move back and forth in the device and in the wires connected to it. For many applications either type of current is suitable, but alternating current (ac) is customarily used because of the greater efficiency with which it can be generated and distributed. A direct current (dc) is required for certain industrial applications, such as electroplating and electrometallurgical processes.

The wide-scale production and distribution of electric power was made possible by the development of the electric generator, a device that operates on the basis of the induction principle formulated in 1831 by the English scientist Michael Faraday and the American scientist Joseph Henry independently of one another. The first public power station employing an electric generator began operation in London in January 1882. A second such station opened later that same year in New York City. Both used dc systems, which proved inefficient for long-distance power transmission. By the early 1890s the first practical ac generator was built at the Lauffen power station in Germany, and service to Frankfurt am Main was initiated in 1891.

There are two primary sources for driving generators—hydro and thermal. Hydroelectric power is derived from generators turned by falling water. Most other electric energy is obtained from generators driven by steam produced either by a nuclear reactor (q.v.) or by burning fossil fuels—namely, coal, oil, and natural gas.

Until the 1930s hydroelectric-power plants equipped with water-turbine generating units produced the largest percentage of electric energy because they were less expensive to operate than thermal-power plants using steam-turbine units. Since that time, however, major technological advances have reduced the cost of thermal-power generation to the extent that it has become more prevalent than hydroelectric-power production, which, by 1990, constituted only 18 percent of global electricity output. Thermal plants using nuclear energy or gas turbines to run steam-electric units are among these technological innovations. Alternative electric energy sources include magnetohydrodynamic (MHD) generators, nuclear fusion reactors, solar batteries, wind turbines, and geothermal-power stations.

Electric energy generated at a central power station is transmitted to bulk delivery points, or substations, from which it is distributed to consumers. Transmission is accomplished by an extensive network of high-voltage power lines, including overhead wires, underground and submarine cables, and microwave systems. Voltages higher than those produced by power plant generators are required when transferring alternating current over long distances, in order to reduce power losses that result from the resistance of transmission lines. Step-up transformers are employed at the generating station to increase the transmission voltage. At the substations other transformers step down the voltage to levels suitable for distribution systems.

electric ray, also called TORPEDO, TORPEDO FISH, NUMBFISH, or CRAMPFISH, any of the

Electric ray (*Narcine brasiliensis*)
Douglas Faulkner

rays of the families Torpedinidae, Narkidae, and Temeiridae, named for their ability to produce electrical shocks. They are found worldwide in warm and temperate waters.

There are numerous species of electric ray; most inhabit shallow water, but some (*Benthothis*) live at depths of 1,000 m (3,300 feet) and more. Slow-moving bottom dwellers, electric rays feed on fishes and invertebrates. They are harmless unless touched or stepped on and are of negligible commercial interest.

Electric rays range in length from under 30 cm (1 foot) to about 2 m (6 feet). They are soft and smooth-skinned, with a circular or nearly circular body disk formed by the head and pectoral fins. The electric organs, composed of modified muscle tissue, are in the disk, one on each side of the head. The shock from these organs is used in defense, sensory location, and capturing prey. Electric shocks emitted reach 220 volts and are strong enough to fell a human adult. In ancient Greece and Rome, the shocks of the species *Torpedo nobiliana* were used as a treatment for gout, headache, and other maladies.

electric susceptibility, quantitative measure of the extent to which an electric field applied to a dielectric material causes polarization, the slight displacement of positive and negative charge within the material. For most linear dielectric materials, the polarization P is directly proportional to the average electric field strength E so that the ratio of the two, P/E , is a constant that expresses an intrinsic property of the material. The electric susceptibility, χ_e , in the centimetre-gram-second (cgs) system, is defined by this ratio; that is, $\chi_e = P/E$. In the metre-kilogram-second (mks) system, electric susceptibility is defined differently by including the constant permittivity of a vacuum, ϵ_0 , in the expression; that is, $\chi_e = P/(\epsilon_0 E)$. In both systems the electric susceptibility is always a dimensionless positive number. Because of the slight difference in definition, the value of the electric susceptibility of a given material in the mks system is 4π times its value in the cgs system.

electric switch, device for opening and closing electrical circuits under normal load conditions, usually operated manually. There are many designs of switches; a common type—the toggle, or tumbler, switch—is widely used in home lighting and other applications. The so-called mercury, or "silent," switch is used extensively for controlling home lighting circuits. The oil switch has its live parts immersed in oil to reduce arcing. The aggregate of switching or circuit-breaking equipment for a power station or a transforming station, frequently located in an outdoor yard (switchyard) beside the station, is usually regarded as switchgear.

electrical and electronics engineering, branch of engineering concerned with the practical applications of electricity and with devices in which the motion of electrons and other charged particles is controlled.

A brief treatment of electrical and electronics engineering follows. For full treatment, see MACROPAEDIA: Electricity and Magnetism; Electronics; Energy Conversion; Engineering; Information Processing and Information Systems; Telecommunications Systems.

Although electrical phenomena had attracted notice as early as the 17th century, it was not until the 19th that any strides were made to develop the study of electricity into a discipline. In that century the basic laws of electricity were mathematically formulated and the first practical applications of electricity were invented (e.g., the telephone and the incandescent lamp).

Great strides have been made in electrical engineering during the 20th century, and the profession can be broadly divided into two major areas—high-power electrical engineer-

ing and low-power, or electronic, engineering. High-power electrical engineering is centred around the ability to transmit high-power currents originating in a central station along wires or cables to more remote parts where it is needed. For example, a power station may be built which can supply all the forms of energy needed in a large metropolitan area, including the energy needed for lighting and heating homes, for powering factories, and for maintaining city services.

The major part of high-power electrical engineering involves the operation of power stations that use the burning of wood, coal, or oil to produce electrical energy or else make use of hydroelectric, nuclear, or geothermal energy. This power is then distributed by cables to the various centres where it is needed. In order to cope with the variations of power demand that will occur, and to cover times of breakdown and maintenance of power stations, cable networks or grids have been built so that the power need not always come from the local power station, but can be shunted from other power stations. There are three major areas of development in high-power electrical engineering—the power converter in the power station, the means of distributing electrical power, and the means of turning the power into a form suitable for heating, lighting, operating mechanical devices, etc.

In the 20th century the so-called low-current, or electronics, engineering has made extraordinary strides. One of the earliest areas of application was the telephone. The invention of the telephone was followed by the wireless telegraph and radio which enabled communication to be made by using electromagnetic waves. With further research and the development of new technology, the vacuum tube was developed, followed some years later by the semiconductor. The semiconductor supplanted the vacuum tube in radio transmission and reception and later in the amplification of audio and video signals for television. The semiconductor eventually came to be used in radar, sonar, and worldwide communications via satellite.

The most widespread use of semiconductors may be in computers. The first computers were large, but as semiconductor technology improved, minicomputers and finally microcomputers were developed.

The first semiconductor, the transistor, was invented in 1948; progressive miniaturization of such devices led to the development of the microchip, which can contain hundreds or thousands of transistors and other components and form a small, integrated circuit. This in turn has led to the production of highly compact and sophisticated computer devices.

Electrical and Electronics Engineers, Institute of (IEEE), international organization of engineers and scientists in electrical engineering, electronics, and allied fields, formed in 1963 by merger of the American Institute of Electrical Engineers (founded 1884) and the Institute of Radio Engineers (founded 1912). It publishes the monthly *Journal of Quantum Electronics* and other journals. Headquarters are in New York City.

electrical double layer, region of molecular dimension at the boundary of two substances across which an electrical field exists. The substances must each contain electrically charged particles, such as electrons, ions, or molecules with a separation of electrical charges (polar molecules). In the electrical double layer, oppositely charged particles attract each other and tend to collect at the surface of each substance but remain separated from one another by the finite size of each particle or by neutral molecules that surround the charged particles. The electrostatic attraction between the two opposite and separated charges causes

an electrical field to be established across the interface.

The electrical field generated within an electrical double layer has a major influence on physical and chemical processes that occur at phase boundaries. For example, in electrochemical cells (apparatus used to generate electric current from a chemical reaction or vice versa) where the fundamental process involves the transfer of electrons between a metallic electrode and a solution, small changes in the electrical field strength across the interface produce large changes in the rate of flow of electrons (current). Consideration of the electrical field strength across the interface is also important in industrial processes in which it is desired to transfer a substance across an electrode-solution boundary, such as the deposition of metal from solution or the dissolution of a metal electrode. The concept of an electrical double layer is essential to the understanding of a large group of electrical phenomena associated with the movement of a solid in a liquid medium—e.g., colloidal particles dispersed in solution—or the movement of a liquid along a fixed solid—e.g., flow of liquid through a capillary tube.

electrical impedance, measure of the total opposition that a circuit or a part of a circuit presents to electric current. Impedance includes both resistance and reactance (*qq.v.*). The resistance component arises from collisions of the current-carrying charged particles with the internal structure of the conductor. The reactance component is an additional opposition to the movement of electric charge that arises from the changing magnetic and electric fields in circuits carrying alternating current. Impedance reduces to resistance in circuits carrying steady direct current.

The magnitude of the impedance Z of a circuit is equal to the maximum value of the potential difference, or voltage, V (volts) across the circuit, divided by the maximum value of the current I (amperes) through the circuit, or simply $Z = V/I$. The unit of impedance, like that of resistance, is the ohm. Depending on the nature of the reactance component of the impedance (whether predominantly inductive or capacitive), the alternating current either lags or leads the voltage. The reciprocal of the impedance, $1/Z$, is called the admittance and is expressed in terms of the unit of conductance, the mho unit (ohm spelled backward).

electrical shock, the perceptible and physical effect of an electrical current that enters the body. The shock may range from an unpleasant but harmless jolt of static electricity, received after one has walked over a thick carpet on a dry day, to a lethal discharge from a power line.

The great majority of deaths occur from alternating current at house-current frequencies of 60 hertz (cycles per second) in North America and 50 hertz in Europe. Most of the deaths occur from contact with conductors at less than 500 volts. That is not to say that high voltages are less dangerous, but they are generally present only on apparatus and supply lines operated by utility companies, which attempt to ensure that only trained and authorized persons have access to them.

The effects of electric shock on the human body depend on the current that flows—the amperage—rather than on the force of the current, or voltage. The electrical resistance of the human body is variable and may in fact alter considerably during the passage of an electric shock. Therefore, except in broad terms, applied voltage is not a consideration. This leads to difficulties in the investigation of accidents, for the electrical engineer is often able to state only the voltage applied, but the physician thinks in terms of the current that flowed.

Another important consideration is the path that the current takes through the body.

Looked at as an electrical conductor, the body behaves as a solution of electrolytes in a leathery container. The greatest current density therefore occurs along the axis joining the two points of contact. As the distance perpendicular to the line of current flow increases, the density of current rapidly falls off. Thus, those organs most likely to be affected are those that lie close to the direct path of the current. As the great majority of electrical fatalities are due to currents passing between an arm (usually the right) and the legs, the current passes through the chest and affects the organs within it. Except in those extremely unusual accidents in which the head makes one of the points of contact, the brain does not lie on or near the pathway of the current.

An electric shock may directly cause death in three ways: paralysis of the breathing centre in the brain, paralysis of the heart, or ventricular fibrillation (uncontrolled, extremely rapid twitching of the heart muscle). It is generally believed that ventricular fibrillation is the most common cause of death in electric shock.

Cardiopulmonary resuscitation (CPR) is the best emergency first-aid treatment for victims of electrical shock. It is a highly effective technique when applied by a well-trained person and can, in many cases, provide adequate short-term life support until more sophisticated treatment is available.

Although the great majority of victims of electric shock, excluding those who have been burned, either die or recover completely, a very small number suffer from aftereffects, which may be temporary but are sometimes permanent. These may include cataract of the eye, a form of angina (attacks of pain beneath the breastbone), or various disorders of the nervous system. A variety of other conditions have been reported, but, in most cases, their exact relationship to the electrical accident is unclear or cannot be clinically substantiated.

electricity, the phenomenon associated with stationary or moving electric charges. Electric charge is a fundamental property of matter and is borne by elementary particles. In electricity the particle involved is the electron, which carries a charge designated, by convention, as negative. Thus, the various manifestations of electricity are the result of the accumulation or motion of numbers of electrons.

A brief treatment of electricity follows. For full treatment, see MACROPAEDIA: Electricity and Magnetism.

Among the earliest electrical phenomena to be studied were those produced by stationary charges, or static electricity. The Greeks discovered that amber, rubbed with fur, attracted light objects such as feathers, and the word electric comes from the Greek *ēlektron*, meaning amber. Serious study of electricity did not begin until the end of the 16th century, when William Gilbert investigated the relation of static electricity and magnetism. Benjamin Franklin proved the electrical nature of lightning in 1752 in his famous kite experiment, and he established the conventional use of negative and positive to distinguish kinds of charge. By the middle of the 18th century, two broad classes of electrical materials had been recognized: insulators, which acquired and retained a static positive or negative surface electric charge when rubbed, and conductors, mostly metals, which did not acquire a charge by rubbing but which were able to carry away the charge from an insulator. It was also found that a conducting body could store a charge if it was insulated from its surroundings. (The acquisition of surface charge by an insulator is now attributed to the ability of atoms either to lose an outer electron, and so exhibit a net positive charge, or to gain an outer electron

for a net negative charge.) In 1767 Joseph Priestley established that electric charges attract with a force inversely proportional to distance, just as Newton had found gravity to do. The science of electrostatics was polished by Henry Cavendish, Charles-Augustin de Coulomb, and Siméon Denis Poisson.

At the beginning of the 19th century, Count Alessandro Volta invented the electric pile, or battery, which was soon developed by others into a practical source of electric current. Within 20 years electric current and static electricity were shown to be manifestations of the same phenomenon. Sir Humphry Davy isolated the metal potassium in 1807 by passing an electric current through an electrolyte of fused potash; from these beginnings sprang electroplating, electrolytic refining, and other operations of the electrochemical industry. In 1808 Davy demonstrated that electricity could provide light or heat when he separated two charcoal electrodes that were carrying a current and drew an arc. In 1820 Hans Christian Ørsted observed the deflection of a compass needle when a nearby conductor carried an electric current and deduced that the current produced its own magnetic field in the space around the conductor. In 1831 Michael Faraday demonstrated the inverse action, whereby a magnetic field induces an electromotive force in a moving conductor. This discovery led to the development of the dynamo, the electric motor, and the transformer. The crowning achievement of 19th-century science was the set of field equations published by James Clerk Maxwell in 1864 that united electrical, magnetic, and optical phenomena in a single universal force, electromagnetism.

The application of what was once a laboratory curiosity to industry and everyday life began in earnest in the latter half of the 19th century. It was not until 1873 that Zenobe Théophile Gramme demonstrated that electric power could be transmitted efficiently from place to place by overhead conductors. After the invention of the incandescent lamp by Thomas A. Edison in 1879 and his construction of the first central power station and distribution system in New York City in 1881, electric power began to be introduced rapidly into the factory and the home. Electricity had by that time already been applied to communication in the form of the electric telegraph and the telephone.

The discovery of the electron by J.J. Thomson in the 1890s, followed quickly by the invention of the diode in 1904 and the triode in 1907, may be taken as marking the historical transition of the science of electricity into the science of electronics (*q.v.*).

electrocardiography, method of graphic tracing (electrocardiogram, or ECG) of the electric current generated by the heart muscle during a heartbeat. The tracing is recorded with an electrocardiograph (actually a relatively simple string galvanometer), and it provides information on the condition and performance of the heart. Electrocardiograms are made by apply-

Two normal heartbeats recorded in a standard lead II electrocardiogram

Heavy horizontal lines are 5 millimetres apart; heavy vertical lines are 0.2 second apart; P wave records the beginning of auricular activity; Q, R, S, and T waves represent ventricular contraction.

ing electrodes to various parts of the body to lead off the tiny heart current to the recording instrument. The four extremities and the chest wall have become standard sites for applying the electrodes. After the electrodes are in place, held with a salt paste, a millivolt from a source outside the body is introduced so that the instrument can be calibrated. Standardizing electrocardiograms makes it possible to compare them as taken from person to person and from time to time from the same person. The normal electrocardiogram shows typical upward and downward deflections that reflect the alternate contraction of the atria (the two upper chambers) and of the ventricles (the two lower chambers) of the heart. The first upward deflection, P, is due to atrial contraction and is known as the atrial complex. The other deflections, Q, R, S, and T, are all due to the action of the ventricles and are known as the ventricular complexes. Any deviation from the norm in a particular electrocardiogram is indicative of a possible heart disorder. Information that can be obtained from an electrocardiogram includes whether the heart is enlarged and where the enlargement occurs, whether the heart action is irregular and where the irregularity originates, whether a coronary vessel is occluded and where the occlusion is located, and whether a slow rate is physiological or caused by heart block. The presence of high blood pressure, thyroid disease, and certain types of malnutrition may also be revealed by an electrocardiogram.

During the late 1960s, computerized ECG's came into use in many of the larger hospitals.

electrochemical reaction, any process either caused or accompanied by the passage of an electric current and involving in most cases the transfer of electrons between two substances—one a solid and the other a liquid.

A brief treatment of electrochemical reactions follows. For full treatment, see *MACROPAEDIA: Chemical Reactions*.

The breadth of occurrence and application of electrochemical reactions is vast. Included are such major categories of activity as electrolysis, metallurgy, battery and fuel cell technology, electroplating, analytical chemistry, and biological research.

There are many spontaneously occurring chemical reactions which, when allowed to proceed under special circumstances, liberate electrical energy in the form of a current. A process of this type involves the direct conversion of the chemical energy, which is liberated in a reaction, to electrical energy. (An apparatus whereby such a process is brought about constitutes an electrical cell.) Conversely, the energy of an electric current can be utilized to produce many chemical reactions that do not occur spontaneously. In processes of this kind, electrical energy is directly converted into chemical energy, which is stored up in the products of the reactions. Electrolysis is such an electrochemical process.

Because of their chemical energy, the products of electrolysis have a tendency to react spontaneously with one another, reproducing the substances that were consumed during the electrolytic process. If this (reverse) reaction is allowed to occur under proper conditions a large proportion of the electrical energy used in electrolysis may be regenerated. This possibility is utilized in accumulators or storage cells, sets of which are known as storage batteries. Storage cells are often referred to as secondary cells to distinguish them from primary cells, which are not designed or constructed for recharging after their original supply of energy has been consumed. The charging of an accumulator is a process of electrolysis; a definite chemical change is produced by the electric current passing through it. In the discharge of the cell, the reverse chemical change occurs spontaneously; the accumulator is acting now as a cell that produces an electric current. The

"storage" of electrical energy in a secondary cell thus involves its conversion into chemical energy, which can be reconverted into electrical energy when desired.

Substances that are reasonably good conductors of electricity may be divided into two groups: metallic, or electronic, conductors and electrolytic conductors. The metals and a few substances such as graphite, manganese dioxide, and lead sulfide exhibit metallic conductivity; the passage of an electric current through them produces heating and magnetic effects but no chemical changes. Electrolytic conductors or electrolytes comprise most acids, bases, and salts, either in the molten condition or in solution in water or other solvents. Plates or rods composed of a suitable metallic conductor dipping into the fluid electrolyte are employed to conduct the current into and out of the liquid; *i.e.*, to act as electrodes. When a current is passed through an electrolyte between suitable electrodes, not only are heating and magnetic effects produced, but also definite chemical changes occur at or in the neighbourhood of the electrodes, the process being one of electrolysis. At the negative electrode, or cathode, the chemical change may be either the deposition of a metal or the liberation of hydrogen and formation of a basic substance or some other chemical reduction process; whereas at the positive electrode, or anode, it may be either the dissolution of the anode itself, the liberation of a nonmetal, the production of oxygen and an acidic substance, or some other chemical oxidation process. In some cases, these primary products of electrolysis then react with the electrolyte or with the material of which the electrodes are composed, yielding secondary products.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

electrochemistry, branch of chemistry concerned with the relation between electricity and chemical change. Many spontaneously occurring chemical reactions liberate electrical energy, and some of these reactions are used in batteries and fuel cells to produce electric power. Conversely, electric current can be utilized to bring about many chemical reactions that do not occur spontaneously. In the process called electrolysis, electrical energy is converted directly into chemical energy, which is stored in the products of the reaction. This process is applied in refining metals, in electroplating, and in producing hydrogen and oxygen from water. The passage of electricity through a gas generally causes chemical changes, and this subject forms a separate branch of electrochemistry.

electrocution, method of execution widely used in the United States, in which the condemned person is subjected to a heavy charge of electric current. The prisoner is made to sit in a wired chair, and electrodes are fastened to his head and one leg so that the current will flow through his body. Several shocks may be applied.

The electric chair was first used at Auburn State Prison, New York, on Aug. 6, 1890, and eventually became the preferred method of executing criminals in the United States. In 1915 Pennsylvania adopted the chair, and it came to be used in 24 states. It was also adopted in the Philippines and in the former Republic of China.

electrode, electric conductor, usually metal, used as either of the two terminals of an electrically conducting medium; it conducts current into and out of the medium, which may be an electrolytic solution as in a storage battery, or a solid, gas, or vacuum. The electrode from which electrons emerge is called the cathode and is designated as negative; the

electrode that receives electrons is called the anode and is designated as positive. In an electron tube, the anode is called the plate, and conducting elements that regulate the electron flow inside the tube are also called electrodes.

electroencephalography, technique for recording and interpreting the electrical activity of the brain. The nerve cells of the

Electroencephalogram showing typical brain wave patterns from a state of excitement to one of deep coma

By courtesy of the Montreal Neurological Institute

brain generate electrical impulses that fluctuate rhythmically in distinct patterns. In 1929 Hans Berger of Germany developed an electroencephalograph, an instrument that measures and records these brain wave patterns. The recording produced by such an instrument is called an electroencephalogram, commonly abbreviated EEG.

To make an EEG, electrodes are placed in pairs on the scalp. Each pair of electrodes transmits a signal to one of several recording channels of the electroencephalograph. This signal consists of the difference in the voltage between the pair. The rhythmic fluctuation of this potential difference is shown as peaks and troughs on a line graph by the recording channel. The EEG of a normal adult in a fully conscious but relaxed state is made up of regularly recurring oscillating waves known as alpha waves. When a person is excited or startled, the alpha waves are replaced by low-voltage, rapid, irregular waves. During sleep, the brain waves become extremely slow. Such is also the case when a person is in a deep coma. Other abnormal conditions are associated with particular EEG patterns. Irregular slow waves known as delta waves, for example, arise from the vicinity of a localized area of brain damage.

Electroencephalography provides a means of studying how the brain works and of tracing connections between one part of the central nervous system and another. Its effectiveness as a research tool, however, is limited because it records only a small sample of electrical activity from the surface of the brain. Many of the more complex functions of the brain, such as those that underlie emotions and thought, cannot be related closely to EEG patterns. Electroencephalography has proved more useful as a diagnostic aid in cases of serious head injuries, brain tumours, cerebral infections, epilepsy, and various degenerative diseases of the nervous system.

electroforming, also called GALVANOPLASTY, making duplicates by electroplating metal onto a mold of an object, then removing the mold. Intricate surface details are exactly reproduced by this process, which is used to make masters for pressing phonograph records. Electroforming is also used for reproducing medals and

for making tubing with precisely controlled dimensions. Electrotyping (*q.v.*) is an electroforming process for making duplicate printing plates.

electrojet, streaming movement of charged particles in the ionosphere. The term is limited by some to those flow patterns that contain a significant proportion of neutral gases, but highly concentrated, laterally limited, electric currents are also called electrojets. The latter circulate within the ionosphere at heights of 80 to 100 km (50 to 60 miles) and complete their circuits in low latitudes and across the polar caps. They are associated with auroras and other magnetic disturbances. *See aurora.*

electroless plating, nonelectrical plating of metals and plastics to achieve uniform coatings by a process of controlled autocatalytic (self-continuing) reduction. Discovered in 1944 by A. Brenner and G.E. Riddell, electroless plating involves the deposition of such metals as copper, nickel, silver, gold, or palladium on the surface of a variety of materials by means of a reducing chemical bath. It is also used in mirroring, in which a clean surface of glass is dipped into an ammoniacal silver solution mixed with Rochelle salt or with a nitric acid-cane-sugar alcohol solution. Nonmetallic surfaces, such as plastics, must be chemically treated prior to electroless plating. The major expansion of electroless plating has come in the area of plastics, as in the plating of printed electronic circuits. A large number of consumer goods are coated by this method to create durable and attractive surfaces.

electroluminescence, production of light by the flow of electrons, as within certain crystals. Electroluminescence is one of the few instances in which a direct conversion of electric energy into visible light takes place without the generation of heat, such as occurs in the incandescent lamp.

There are two distinct mechanisms that can produce electroluminescence in crystals: pure or intrinsic (also called the Destriau effect, after Georges Destriau, a 20th-century French physicist) and charge injection. The principal differences between the two mechanisms are that in the first, no net current passes through the phosphor (electroluminescent material) and in the second, luminescence prevails during the passage of an electric current.

Destriau Electroluminescence
Encyclopedia Britannica, Inc.

In Destriau electroluminescence, thermal activation and the electric field liberate atomic electrons (from donor levels) into the conduction band. Many of these conduction electrons are accelerated by the field until they collide with luminescent centres, ionizing them (*i.e.*, ejecting electrons from their atoms). Light is emitted in the normal way as soon as an electron recombines with an ionized atom of the centre. Because the effect dies away when constant voltage is applied, an alternating voltage may be used to create a sustained light emission. The Destriau effect may be extended over large areas so that electroluminescent cells may be made with which to panel walls and ceilings of a room for general illumination. The Figure shows a typical cell in which a phosphor, such as zinc sulfide

(ZnS), is mixed with various small particles, or dopants, and embedded in an insulating film. The insulating film is then sandwiched between two electrodes. The front electrode consists of a thin transparent film of tin (IV) oxide (SnO_2), which is coated onto a glass plate. The rear electrode is coated black to render it opaque, thereby making the emitted light rays easier to see. When alternating current is applied to the cell, an intense electric field is generated, which activates the dopants within the phosphor. The colour of the emitted light depends upon the composition of these dopants as well as the voltage frequency. For example, a mixture of copper (Cu) and chlorine (Cl) produces blue light; copper and aluminum (Al) produce green light; and copper, chlorine, and manganese (Mn) together produce yellow light.

Electroluminescence can also result from charge injection, as when an electrode contacts a crystal to provide a flow of electrons or holes (electron extraction) or a voltage is applied to a *p-n* junction causing a current to flow; *i.e.*, electrons flow from the *n*-type material into the *p*-type material. In both cases, the electrons lose energy when recombining with centres or positive holes accompanied by the emission of light.

electrolysis, process by which electric current is passed through a substance to effect a chemical change. The chemical change is one in which the substance loses or gains an electron (oxidation or reduction). The process is carried out in an electrolytic cell (*q.v.*), an apparatus consisting of positive and negative electrodes held apart and dipped into a solution containing positively and negatively charged ions. The substance to be transformed may form the electrode, may constitute the solution, or may be dissolved in the solution. Electric current (*i.e.*, electrons) enters through the negatively charged electrode (cathode); positively charged components of the solution travel to this electrode, combine with the electrons, and are transformed to neutral elements or molecules. The negatively charged components of the solution travel to the other electrode (anode), give up their electrons, and are transformed into neutral elements or molecules. If the substance to be transformed is the electrode, the reaction is generally one in which the electrode dissolves by giving up electrons.

Electrolysis is used extensively in metallurgical processes, such as in extraction (electrowinning) or purification (electrorefining) of metals from ores or compounds and in deposition of metals from solution (electroplating). Metallic sodium and chlorine gas are produced by the electrolysis of molten sodium chloride; electrolysis of an aqueous solution of sodium chloride yields sodium hydroxide and chlorine gas. Hydrogen and oxygen are produced by the electrolysis of water.

electrolyte, in chemistry and physics, substance that conducts electric current as a result of a dissociation into positively and negatively charged particles called ions, which migrate toward and ordinarily are discharged at the negative and positive terminals (cathode and anode) of an electric circuit, respectively. The most familiar electrolytes are acids, bases, and salts, which ionize when dissolved in such solvents as water or alcohol. Many salts, such as sodium chloride, behave as electrolytes when melted in the absence of any solvent; and some, such as silver iodide, are electrolytes even in the solid state.

electrolytic cell, any device in which electrical energy is converted to chemical energy, or vice versa. Such a cell typically consists of two metallic or electronic conductors (electrodes)

held apart from each other and in contact with an electrolyte (*q.v.*), usually a dissolved or fused ionic compound. Connection of the electrodes to a source of direct electric current renders one of them negatively charged and the other positively charged. Positive ions in the electrolyte migrate to the negative electrode (cathode) and there combine with one or more electrons, losing part or all of their charge and becoming new ions having lower charge or neutral atoms or molecules; at the same time, negative ions migrate to the positive electrode (anode) and transfer one or more electrons to it, also becoming new ions or neutral particles. The overall effect of the two processes is the transfer of electrons from the negative ions to the positive ions, a chemical reaction (*see* oxidation-reduction reactions). An example is the electrolysis of sodium chloride (common salt), forming sodium metal and chlorine gas; the energy required to make the reaction proceed is supplied by the electric current. Other common applications of electrolysis include electrodeposition for refining or plating of metals and the production of caustic soda.

In the case of substances that generate energy, rather than consume it, when they react with each other, some or all of this energy can be converted to electricity if the reaction can be divided into an oxidation and a reduction that can be made to occur at separate electrodes. In the lead-acid storage battery, for example, lead dioxide, lead metal, and sulfuric acid react to form lead sulfate and water; the separate processes are the oxidation of lead to lead sulfate at one electrode and the reduction of lead dioxide to lead sulfate at the other while electric charge is transported through the electrolyte by the migration of hydrogen ions. These processes create a driving force (a voltage or electrical potential) that causes electricity to flow through an external circuit joining the two electrodes. Many other chemical combinations have been utilized in cells and batteries.

Other cells for generating electricity by means other than motion of a conductor in a magnetic field include solar cells, in which electron flow between semiconductors results from absorption of light, and fuel cells, in which a continuous supply of liquid or gaseous oxidizing agent, such as oxygen, removes electrons from the cathode as a reducing agent, such as hydrogen, supplies electrons to the anode.

electrolytic polishing: *see* electropolishing.

electromagnet, device consisting of a core of magnetic material surrounded by a coil through which an electric current is passed to magnetize the core. An electromagnet is used wherever controllable magnets are required, as in contrivances in which the magnetic flux is to be varied, reversed, or switched on and off.

The engineering design of electromagnets is systematized by means of the concept of the magnetic circuit. In the magnetic circuit a magnetomotive force F , or F_m , is defined as the ampere-turns of the coil that generates the magnetic field to produce the magnetic flux in the circuit. Thus, if a coil of n turns per metre carries a current i amperes, the field inside the coil is ni amperes per metre and the magnetomotive force that it generates is nil ampere-turns, where l is the length of the coil. More conveniently, the magnetomotive force is Ni , where N is the total number of turns in the coil. The magnetic flux density B is the equivalent, in the magnetic circuit, of the current density in an electric circuit. In the magnetic circuit the magnetic equivalent to current is the total flux symbolized by the Greek letter phi, ϕ , given by BA , where A is the cross-sectional area of the magnetic circuit.

Figure 1: Elements of a solenoid

In an electric circuit the electromotive force (E) is related to the current, i , in the circuit by $E = Ri$, where R is the resistance of the circuit. In the magnetic circuit $F = r\phi$, where r is the reluctance of the magnetic circuit and is equivalent to resistance in the electric circuit. Reluctance is obtained by dividing the length of the magnetic path l by the permeability times the cross-sectional area A ; thus $r = l/\mu A$, the Greek letter mu, μ , symbolizing the permeability of the medium forming the magnetic circuit. The units of reluctance are ampere-turns per weber. These concepts can be employed to calculate the reluctance of a magnetic circuit and thus the current required through a coil to force the desired flux through this circuit.

Thus, the calculation can only be done for a real material if the actual magnetization curve, or, more usefully, a graph of μ against B , is available.

Finally, the design assumes that the magnetic core is not magnetized to saturation. If it were, the flux density could not be increased in the air gap in this design, no matter how much current were passed through the coil. These concepts are expanded further in following sections on specific devices.

Solenoids. A solenoid is generally a long coil through which current is flowing, establishing a magnetic field. More narrowly, the name has come to refer to an electromechanical device that produces a mechanical motion on being energized with an electric current. In

Figure 2: Elements of a relay

Several assumptions involved in this type of calculation, however, make it at best only an approximate guide to design. The effect of a permeable medium on a magnetic field can be visualized as being to crowd the magnetic lines of force into itself. Conversely, the lines of force passing from a region of high to one of low permeability tend to spread out, and this occurrence will take place at an air gap. Thus the flux density, which is proportional to the number of lines of force per unit area, will be reduced in the air gap by the lines bulging out, or fringing, at the sides of the gap. This effect will increase for longer gaps; rough corrections can be made for taking the fringing effect into account.

its simplest form it consists of an iron frame enclosing the coil and a cylindrical plunger moving inside the coil, as shown in Figure 1. For an alternating current supply, the iron losses in a solid frame restrict the efficiency and a laminated frame is used, which is made up of a pile of thin sheets of iron cut to the appropriate shape and stacked with a layer of insulating varnish between each sheet. When the coil is energized, the plunger moves into the coil by virtue of the magnetic attraction between it and the frame until it makes contact with the frame.

Alternating-current solenoids tend to be more powerful in the fully open position than direct-current units. This occurs because the initial

Figure 3: Elements of a reed relay

It has also been assumed that the magnetic field is entirely confined within the coil. In fact, there is always a certain amount of leakage flux, represented by magnetic lines of force around the outside of the coil, which does not contribute to the magnetization of the core. The leakage flux is generally small if the permeability of the magnetic core is relatively high.

In practice, the permeability of a magnetic material is a function of the flux density in

current, high because of the inductance of the coil, is lowered by the air gap between the plunger and frame. As the solenoid closes, this air gap decreases, the inductance of the coil increases, and the alternating current through it falls. If an alternating-current solenoid sticks in the open position the coil is likely to burn out.

When a solenoid is fully opened, it has a large air gap, and the high reluctance of this gap keeps the flux in the magnetic circuit low for

a given magnetomotive force, and the force on the plunger is correspondingly low. As the plunger closes, the reluctance falls and the flux increases so that the force increases progressively. Manufacturers of solenoids provide force-stroke curves so that users can select the proper unit for their purpose. The curve can be modified by spring loading the plunger so that the force provided throughout the stroke may be matched to the particular mechanical load.

Relays. A relay is a device in which the solenoid principle is applied to opening and closing light-current electrical circuits. The same device applied in heavy-current circuits is called a contactor, or circuit breaker.

Because the amount of mechanical movement required is generally small, the solenoid plunger is usually stationary, and part of the frame is hinged to give the necessary movement. This arrangement is illustrated schematically in Figure 2. When the coil is energized, the hinged part of the frame is attracted to the solid iron core in the coil; this attraction pushes the contacts together. When the energizing current is removed, the hinged part is forced back to the open position by the springiness of the contact.

With the appearance of transistorized switching circuits, which use remarkably low power, a need arose for a relay that would operate reliably with a power of 100 to 300 milliwatts, compared with 4 watts for the conventional relay. This need was met by the reed relay, or reed switch, shown in Figure 3. It consists of two flat blades of 50–50 nickel-iron alloy that overlap with a gap between them. When a magnetic field is applied along the length of the blades, opposite magnetic poles are induced in the overlapping parts, and they are attracted together, making electrical contact. On removal of the field, the springiness of the contact blade opens the contact. The overlap region is plated on each blade with gold to ensure good electrical contact, and the enclosing glass capsule is filled with dry nitrogen to prevent corrosion. The field required to operate the device is a function of the amount of overlap, and there is an optimum overlap

energizing field is removed. They can also be designed with three blades to give changeover contacts.

Design of large electromagnets. Sooner or later almost every scientific research laboratory finds that it requires a facility for producing large magnetic fields. A number of advanced technologies likewise require large electromagnets. A cyclotron, for example, is a device used for scientific research in which subatomic charged particles are accelerated by an alternating electric field in a constant magnetic field. It uses a large magnet to produce moderate fields but with a pole diameter that may be several metres. Some industries make use of huge, high-powered electromagnets for lifting purposes.

The basic design principles of large electromagnets are those discussed earlier. The difficulties arise in trying to estimate the magnitude of the fringing flux across the air gap and the leakage flux around the coils. Their effects are minimized by using a tapered shape for the cores and pole caps; a typical laboratory magnet is shown in Figure 4. Because soft iron saturates at 2.16 webers per square m, flux densities in the air gap are generally limited to the region of 2.1 webers per square m with iron magnets.

When designed for lifting or load-carrying purposes, an electromagnet may be required to have a single exposed pole face to which the load to be carried will attach itself, and it will therefore have the shape of a bar magnet. The design is then dominated by the demagnetizing field. Suitably designed magnets can lift many times their own weight and are in general use in steelworks and scrapyards.

Principal applications. Electromagnets have a wide variety of uses. A summary of the principles of operation of some of the important devices in a few major areas of application—communications, research, electrical industry, and magnetic recording—is given below.

Modern telephone systems are based on the reed relay, together with solid-state circuits for complex routing of connections. The telephone receiver is basically an electromagnet with a U-shaped yoke having coils wound on

the diaphragm, as in the earphone. Modern loudspeakers are much more sensitive and efficient than their predecessors because of the improvement in permanent-magnet materials. The higher the flux density in the gap, the greater the sensitivity and the potential for fidelity of reproduction; modern loudspeakers use flux densities of up to one weber per square m. Alloy magnets are usually used.

Magnetic fields supply a powerful research tool without which modern physics could scarcely have grown to its present extent. A major area of application is in the interaction of magnetic fields and charged subatomic particles. A moving particle that carries a charge, such as an electron, can be regarded as an electric current and, like a current-carrying wire, experiences a force in a magnetic field. The direction of the force is perpendicular both to the direction of motion of the particle and to the magnetic field, so that the particle is deflected from its original path. This principle can be used to focus a stream of electrons into a narrow beam and to deflect the beam by creating suitable magnetic fields, either from permanent magnets or from electromagnets. Every television receiver contains just such focusing and deflection systems to scan the face of the television tube with an electron beam.

In scientific applications the same principle is used in the electron microscope, in which the beam of electrons is passed through a series of magnetic "lenses," just as light is passed through glass lenses in a conventional microscope.

As noted above, the cyclotron makes use of a magnetic field to cause charged particles to execute a circular path. On each traverse of the circle they are accelerated and finally acquire enormous kinetic energy (energy of motion). The cyclotron has been an important tool in nuclear research and in the production of radioactive isotopes.

The same principle may be used to analyze materials in the mass spectrometer. The actual deflection of a moving charged particle in a magnetic field is determined by its charge, mass, and velocity. In a mass spectrometer the material under investigation is in the form of a gas of ionized particles that are accelerated by a fixed electric field. In passing through the magnetic field the particles are deflected by an amount determined by their mass, providing they all carry the same charge. By recording their arrival position at a fixed target, the mass of the particles can be deduced.

The electrical industry is founded on the generation and exploitation of magnetic fields. The electric motor is based on the force generated on a current-carrying conductor; the generator is based on the inverse effect that a conductor moving in a magnetic field has a current induced in it. In general, high-flux densities are required in the magnetic circuits of motors and generators, and this requirement has led to the use of soft iron or silicon-iron electromagnets as the source of magnetic fields in them. With the advent of modern permanent-magnet materials, however, small direct-current motors, in which the field is provided by permanent magnets, are finding wide applications, particularly in the toy industry (*see magnet*).

The principle of magnetic recording is to induce a permanent magnetization in a material by means of the signal to be recorded. The induced magnetization must be proportional to the amplitude of the signal and must remain in the material when the signal is removed. Thus, a magnetic material is required that has a high permeability, so that it will magnetize readily in a small field; a high remanent magnetization, so that the stored information can be easily "read"; and not too high (but not too low) a coercive force, so that the stored

Figure 4: Elements of a typical electromagnet

corresponding to minimum required operating current.

Present reed switches used in telephone equipment are operated by up to 50 volts direct current. Typically, the reed closes at 58 ampere-turns and releases at 15 ampere-turns, the hold current being 27 ampere-turns. The contact closes to give a stable contact resistance in 2 milliseconds, releases in 100 microseconds, and has a lifetime of more than 50,000,000 operations. Using a 35,000 turn coil the coil resistance is typically 18,600 ohms so that the current at 50 volts is 2.7 milliamperes. The minimum operating condition requires only about 1.7 milliamperes, so that the relay can be worked satisfactorily at lower voltage.

By the use of small, external, permanent magnets, reed switches can be made into latching relays that remain closed when the

each leg of the U. Passage of the electrical signal through the coils causes magnetic attraction of a soft-iron diaphragm supported a small distance from the ends of the U. The diaphragm is deflected by an amount proportional to the magnitude of the current in the coil and generates sound waves as it moves back and forth. Improvement in magnetic materials has increased the sensitivity of the telephone receiver, but the basic design has remained unchanged.

The loudspeaker performs the same function as the earphone of the telephone receiver but is required to displace a larger volume of air. The diaphragm comprises a flexible cone of large area carrying a coil of fine wire on a small ring located at its apex. The ring lies between the poles of a powerful cylindrically shaped permanent magnet. Audio-frequency current through the coil causes deflection of

information can be erased without great difficulty.

The most common type of magnetic recorder makes use of a magnetic tape. This passes at constant speed close to a recording head that may consist of a U-shaped magnet yoke with coils wound on each limb. As the current in the coil varies in accordance with the audio-frequency signal to be recorded, a varying magnetization is induced in the tape. To play back the recorded information, the tape is passed through or near a coil so that the magnetic flux from the tape cuts the wires of the coil and induces an audio-frequency current in it. The tape may be erased by passing it through a recording head that carries a high-frequency signal, which has the effect of demagnetizing the tape.

Computer information is in a particularly simple form for magnetic storage because it consists of a chain of electrical pulses of standard amplitude. Material requirements for the tape are not so stringent as for audio recording, the important feature being only that the tape should not demagnetize spontaneously. Many computers have replaced tape storage by discs of magnetic alloy that rotate under the recording head. Information can be stored at a higher density (bits per unit area) than in tape, and access to the information can be made faster by traversing the "read" head in a radial direction across the discs. For information on other related magnetic recording devices, see magnetic recording.

electromagnetic field, a property of space caused by the motion of an electric charge. A stationary charge will produce only an electric field in the surrounding space. If the charge is moving, a magnetic field is also produced. An electric field can be produced also by a changing magnetic field. The mutual interaction of electric and magnetic fields produces an electromagnetic field, which is considered as having its own existence in space apart from the charges or currents (a stream of moving charges) with which it may be related. Under certain circumstances, this electromagnetic field can be described as a wave transporting electromagnetic energy.

electromagnetic radiation, energy that is propagated through free space or through a material medium in the form of electromagnetic waves, such as radio waves, visible light, and gamma rays. The term also refers to the emission and transmission of such radiant energy.

A brief treatment of electromagnetic radiation follows. For full treatment, see MACROPAEDIA: Electromagnetic Radiation; Light; Radiation.

The Scottish physicist James Clerk Maxwell was the first to predict the existence of electromagnetic waves. In 1864 he set forth his electromagnetic theory, proposing that light—including various other forms of radiant energy—is an electromagnetic disturbance in the form of waves. In 1887 Heinrich Hertz, a German physicist, provided experimental confirmation by producing the first man-made electromagnetic waves and investigating their properties. Subsequent studies resulted in a broader understanding of the nature and origin of radiant energy.

It has been established that time-varying electric fields can induce magnetic fields and that time-varying magnetic fields can in like manner induce electric fields. Because such electric and magnetic fields generate each other, they occur jointly, and together they propagate as electromagnetic waves. An electromagnetic wave is a transverse wave in that the electric field and the magnetic field at any point and time in the wave are perpendicular to each other as well as to the direction of

propagation. In free space (*i.e.*, a space that is absolutely devoid of matter and that experiences no intrusion from other fields or forces), electromagnetic waves always propagate with the same speed—that of light (299,792,458 m per second, or 186,282 miles per second)—independent of the speed of the observer or of the source of the waves.

Electromagnetic radiation has properties in common with other forms of waves such as reflection, refraction, diffraction, and interference. Moreover, it may be characterized by the frequency with which it varies over time or by its wavelength. Electromagnetic radiation, however, has particle-like properties in addition to those associated with wave motion. It is quantized in that for a given frequency ν , its energy occurs as an integer times $h\nu$, in which h is a fundamental constant of nature known as Planck's constant. A quantum of electromagnetic energy is called a photon. Visible light and other forms of electromagnetic radiation may be thought of as a stream of photons, with photon energy directly proportional to frequency.

Electromagnetic radiation spans an enormous range of frequencies or wavelengths, as is shown by the electromagnetic spectrum (*see*

higher frequency than X rays, have basically the same nature. When the energy of gamma rays is absorbed in matter, its effect is virtually indistinguishable from the effect produced by X rays.

There are many sources of electromagnetic radiation, both natural and man-made. Radio waves, for example, are produced by cosmic objects such as pulsars and quasars and by electronic circuits. Sources of ultraviolet radiation include mercury vapour lamps and high-intensity lights, as well as the Sun. The latter also generates X rays, as do certain types of particle accelerators and electronic devices.

electrometer, instrument designed to measure very small voltages and currents. The quadrant, Lindermann, Hoffman, and Wulf electrometers measure electrical potential between charged elements (*e.g.*, plates or fine quartz fibres) within the housings of the electrometer. The sensitivity of these instruments is about 0.01 volt.

A much more sensitive device is the vacuum-tube electrometer, a direct-current amplifier capable of measuring currents as minute as 10^{-15} amperes (about 10,000 electrons per second). This instrument, however, is subject to drift. A newer version of this type of electrometer replaces the electron tube with a matched pair of junction field-effect transistors. To aid in stabilizing the output-signal voltage, some of these devices are operated at temperatures approaching absolute zero (-459.67°F [-273.15°C]).

The vibrating-reed electrometer uses a capacitor that has a vibrating reed as one of its plates. Movement of the reed changes the voltage across the capacitor. The output of the electrometer (which is easily amplified without drift) is the current necessary to keep the meter's capacitance constant.

Uses of electrometers include studying the ionizing effects of cosmic rays, determining absorption spectra in chemical analysis, and counting ions in gas chromatography.

electromotive force, abbreviation *E*, or EMF, energy per unit electric charge that is imparted by an energy source, such as an electric generator or a battery. Energy is converted from one form to another in the generator or battery as the device does work on the electric charge being transferred within itself. One terminal of the device becomes positively charged, the other becomes negatively charged. The work done on a unit of electric charge, or the energy thereby gained per unit electric charge, is the electromotive force. Electromotive force is the characteristic of any energy source capable of driving electric charge around a circuit. It is abbreviated *E* in the international metric system but also, popularly, as *emf*.

A common unit of electromagnetic force is the volt, equivalent in the metre-kilogram-second system to one joule per coulomb of electric charge. In the electrostatic units of the centimetre-gram-second system, the unit of electromagnetic force is the statvolt, or one erg per electrostatic unit of charge.

electromotive series, listing of chemical species (atoms, molecules, and ions) in the order of their tendency to gain or lose electrons (be reduced or oxidized, respectively), expressed in volts and measured with reference to the hydrogen electrode, which is taken as a standard and arbitrarily assigned the voltage of zero. At the hydrogen electrode, an aqueous solution containing hydrogen in its oxidized form (the hydrogen ion, H^+) at a concentration of one mole per litre is maintained at 25°C (77°F) in equilibrium with hydrogen in its reduced form (hydrogen gas, H_2) at a pressure of one atmosphere. The reversible oxidation-reduction half reaction is expressed by the equation $2\text{H}^+ + 2e^- \rightleftharpoons \text{H}_2$, in which e^- represents an electron. The electrode potentials of several elements are shown in the Table.

The electromagnetic spectrum
From F. Bueche, *Principles of Physics* (1965), McGraw-Hill Book Company, publisher

Figure). Customarily, it is designated by fields, waves, and particles in increasing magnitude of frequencies—radio waves, microwaves, infrared rays, visible light, ultraviolet light, X rays, and gamma rays. The corresponding wavelengths are inversely proportional, and both the frequency and wavelength scales are logarithmic.

Electromagnetic radiation of different frequencies interacts with matter differently. A vacuum is the only perfectly transparent medium, and all material media absorb strongly some regions of the electromagnetic spectrum. For example, molecular oxygen (O_2), ozone (O_3), and molecular nitrogen (N_2) in the Earth's atmosphere are almost perfectly transparent to infrared rays of all frequencies, but they strongly absorb ultraviolet light, X rays, and gamma rays. The frequency (or energy equal to $h\nu$) of X rays is substantially higher than that of visible light, and so X rays are able to penetrate many materials that do not transmit light. Moreover, absorption of X rays by a molecular system can cause chemical reactions to occur. When X rays are absorbed in a gas, for instance, they eject photoelectrons from the gas, which in turn ionize its molecules. If these processes occur in living tissue, the photoelectrons emitted from the organic molecules destroy the cells of the tissue. Gamma rays, though generally of somewhat

Electromotive series at 25° C

	ion	half reaction	electrode potential (volt)
metals			
lithium	Li ⁺	Li = Li ⁺ + e ⁻	-3.05
potassium	K ⁺	K = K ⁺ + e ⁻	-2.92
barium	Ba ²⁺	Ba = Ba ²⁺ + 2e ⁻	-2.90
calcium	Ca ²⁺	Ca = Ca ²⁺ + 2e ⁻	-2.87
sodium	Na ⁺	Na = Na ⁺ + e ⁻	-2.71
magnesium	Mg ²⁺	Mg = Mg ²⁺ + 2e ⁻	-2.37
aluminum	Al ³⁺	Al = Al ³⁺ + 3e ⁻	-1.66
zinc	Zn ²⁺	Zn = Zn ²⁺ + 2e ⁻	-0.76
iron	Fe ²⁺	Fe = Fe ²⁺ + 2e ⁻	-0.44
cadmium	Cd ²⁺	Cd = Cd ²⁺ + 2e ⁻	-0.40
nickel	Ni ²⁺	Ni = Ni ²⁺ + 2e ⁻	-0.25
tin	Sn ²⁺	Sn = Sn ²⁺ + 2e ⁻	-0.14
lead	Pb ²⁺	Pb = Pb ²⁺ + 2e ⁻	-0.13
hydrogen	H ⁺	H ₂ = 2H ⁺ + 2e ⁻	0.00
copper	Cu ²⁺	Cu = Cu ²⁺ + 2e ⁻	+0.34
mercury	Hg ²⁺	2Hg = Hg ₂ ²⁺ + 2e ⁻	+0.79
silver	Ag ⁺	Ag = Ag ⁺ + e ⁻	+0.80
platinum	Pt ²⁺	Pt = Pt ²⁺ + 2e ⁻	+1.20
gold	Au ³⁺	Au = Au ³⁺ + 3e ⁻	+1.49
nonmetals			
sulfur	S ²⁻	S ₂ ²⁻ = S + 2e ⁻	+0.48
iodine	I ⁻	2I ⁻ = I ₂ + 2e ⁻	+0.54
bromine	Br ⁻	2Br ⁻ = Br ₂ + 2e ⁻	+1.07
chlorine	Cl ⁻	2Cl ⁻ = Cl ₂ + 2e ⁻	+1.36
fluorine	F ⁻	2F ⁻ = F ₂ + 2e ⁻	+2.87

Conflicting conventions have been used for the signs of these potentials; those shown in the Table generally agree with the recommendations of an international conference in 1953.

By subtracting one half reaction (and its potential) from another, the tendency of the resulting complete chemical reaction to occur may be determined; for example, the half reactions for copper and zinc may be combined to show that the reaction $\text{Cu}^{2+} + \text{Zn} \rightleftharpoons \text{Cu} + \text{Zn}^{2+}$ has a potential of -1.10 volts. In conformity with the 1953 convention, the negative value of the voltage indicates that this reaction proceeds spontaneously from left to right as written; that is, metallic zinc dissolves in a solution of copper(II) ions to form metallic copper and to set free zinc(II) ions in the solution.

electromyography, the process of graphically recording the electrical activity of muscle. Normal muscle is electrically silent when at rest, but when it is active, as during contraction or stimulation, an electrical current is generated, and the successive action potentials (impulses) can be registered on a cathode-ray

Electromyographic patterns

(A) Fibrillation; (B) fasciculation; (C) normal muscle; (D) muscular dystrophy

From Winthrobe et al. (eds.), *Harrison's Principles of Internal Medicine*, © 1970 by McGraw-Hill, Inc. used by permission

oscilloscope screen in the form of continuous wavelike tracings. The visual recording, called an electromyogram, or EMG, is customarily accompanied by auditory monitoring with a loudspeaker. For diagnostic purposes, records of muscle electrical activity are usually obtained during muscle relaxation, during voluntary contraction when needle electrodes are inserted into the muscle under study, and dur-

ing muscle activity evoked by the stimulation of its nerve. Weakness or wasting of muscle is generally caused either by impairment of the nerves supplying it (neuropathic disorders, such as amyotrophic lateral sclerosis and poliomyelitis) or by intrinsic muscle impairment or primary muscle disease (myopathy). In neuropathic disorders, there is usually increased spontaneous activity during muscle relaxation (fibrillation and fasciculation), together with reduced, altered, or absent normal muscle action potentials. In myopathies, there is frequently a reduction in the amplitude or duration of the muscle action potentials and an increase in the complexity of their wave form.

electron, lightest stable subatomic particle known. It carries a negative charge which is considered the basic charge of electricity.

A brief treatment of electrons follows. For full treatment, see *MACROPAEDIA: Atoms: Their Structure, Properties, and Component Particles*.

An electron is nearly massless. It has a rest mass of 9.1×10^{-28} gram, which is only 0.0005 the mass of a proton. The electron is a fermion, a type of particle named after the Fermi-Dirac statistics that describe its behaviour. It has a half-integral spin—spin constitutes the property of intrinsic angular momentum in quantum-mechanical terms. Moreover, the electron reacts only by the electromagnetic, weak, and gravitational forces; it does not respond to the short-range strong nuclear force that acts between quarks and binds protons and neutrons in the atomic nucleus. The electron has an antimatter counterpart called the positron. This antiparticle has precisely the same mass and spin, but it carries a positive charge. If it meets an electron, both are annihilated in a burst of energy. Positrons are rare on the Earth, being produced only in high-energy processes (e.g., by cosmic rays) and live only for brief intervals before annihilation by electrons that abound everywhere.

The electron was the first subatomic particle discovered. It was identified in 1897 by the British physicist J.J. Thomson during investigations of cathode rays. His discovery of electrons, which he initially called corpuscles, played a pivotal role in revolutionizing knowledge of atomic structure.

Under ordinary conditions, electrons are bound to the positively charged nuclei of atoms by the attraction between opposite electric charges. In a neutral atom the number of electrons is identical to the number of positive charges on the nucleus. Any atom, however, may have more or fewer electrons than positive charges and thus be negatively or positively charged as a whole; these charged atoms are known as ions. Not all electrons are associated with atoms. Some occur in a free state with ions in the form of matter known as plasma.

Within any given atom, electrons move about the nucleus in an orderly arrangement of orbitals, the attraction between electrons and nucleus overcoming repulsion among the electrons that would otherwise cause them to fly apart. These orbitals are organized in concentric shells proceeding outward from the nucleus with an increasing number of subshells. The electrons in orbitals closest to the nucleus are held most tightly; those in the outermost orbitals are shielded by intervening electrons and are the most loosely held by the nucleus. As the electrons move about within this structure, they form a diffuse cloud of negative charge that occupies nearly the entire volume of the atom. The arrangement of electrons therefore determines the size of an individual atom. It also affects the way that the atom responds to other atoms, particles, and electromagnetic radiation.

electron affinity, in chemistry, the amount of energy liberated when an electron is added

to a neutral atom to form a negatively charged ion. The electron affinities of atoms are difficult to measure, hence values are available for only a few chemical elements, chiefly the halogens. These values were obtained from measurements of heats of formation and lattice energies of ionic compounds of the elements. The electron affinity of an element is a measure of that element's tendency to act as an oxidizing agent (an electron acceptor) and is generally related to the nature of the chemical bonds the element forms with other elements.

electron beam, stream of electrons (as from a betatron) used chiefly in research, technology, and medical therapy to produce X rays and images on television, oscilloscope, and electron-microscope screens. Electrons may be collimated by holes and slits, and, because they are electrically charged, they may be deflected, focused, and energized by electric and magnetic fields.

electron capture, one of three processes of radioactive disintegration known as beta decay (*q.v.*).

electron charge (symbol *e*), fundamental physical constant expressing the naturally occurring unit of electric charge (*q.v.*), equal to $1.6021892 \times 10^{-19}$ coulomb, or 4.803250×10^{-10} electrostatic unit (esu, or statcoulomb). In addition to the electron, all charged subatomic particles thus far discovered have an electric charge equal to this value or some whole-number multiple of it.

electron diffraction, bending of a beam of electrons when passing near matter or through spacings in its submicroscopic structure that are comparable in size to the wavelength of an electron. According to the proposal (1924) of the French physicist Louis de Broglie, electrons and other particles have wavelengths that are inversely proportional to their momentum. Consequently, high-speed electrons have short wavelengths, a range of which are comparable to the spacings between atomic layers in crystals. A beam of such high-speed electrons should undergo diffraction, a characteristic wave effect, when directed through thin sheets of material or when reflected from the faces of crystals. Electron diffraction, in fact, was observed (1927) by C.J. Davisson and L.H. Germer in New York and by G.P. Thomson in Aberdeen, Scot., and the wave nature of electron beams was thereby experimentally established.

As an analytic method, electron diffraction is used to identify a substance chemically or to locate the position of atoms in a substance. This information can be read from the patterns that are formed when various portions of the diffracted electron beam cross each other and by interference make a regular arrangement of impact positions, some where many electrons reach and some where few or no electrons reach. Recorded photographically or otherwise, such a distribution is called a diffraction pattern, which when properly interpreted yields information about the nature and structure of the gas, liquid, or solid that caused the electron diffraction.

electron gun, electrode structure that produces and may control, focus, and deflect a beam of electrons, as in a television picture tube, where the beam produces a visual pattern on the tube's screen. At one end of the gun is the cathode, a flat metal support covered with oxides of barium and strontium. When heated by a coil behind the support, these oxides emit electrons, which are drawn toward a positively charged sleeve (first anode) and partially intercepted by a flat disk (the control electrode).

electron microscope, microscope that attains extremely high resolution using an electron beam instead of a beam of light to illuminate the object of study. *See* microscope.

electron optics, branch of physics that is concerned with beams of electrons, their deflection and focusing by electric and magnetic fields, their interference when crossing each other, and their diffraction or bending when passing very near matter or through the spacings in its submicroscopic structure. Electron optics is based on the wave properties of electrons, which, according to quantum theory, can be treated either as particles or as waves. The wave behaviour was predicted and then experimentally established in the 1920s. Beams of electrons exhibit behaviour similar to those of light and X rays, and all these are subject to the same mathematical descriptions. One of the applications of electron optics is the electron microscope.

electron paramagnetic resonance (EPR), also called ELECTRON-SPIN RESONANCE (ESR), selective absorption of weak radio-frequency electromagnetic radiation (in the microwave region) by unpaired electrons in the atomic structure of certain materials that simultaneously are subjected to a constant, strong magnetic field. The unpaired electrons, because of their spin, behave like tiny magnets. When materials containing such electrons are subjected to a strong stationary magnetic field, the magnetic axes of the unpaired electrons, or elementary magnets, partially align themselves with the strong external field, and they precess in the field much as the axes of spinning tops often trace cone-shaped surfaces as they precess in the gravitational field of the Earth. Resonance is the absorption of energy from the weak alternating magnetic field of the microwave when its frequency corresponds to the natural frequency of precession of the elementary magnets. When either the microwave frequency or the stationary field strength is varied and the other is kept fixed, the measurement of radiation absorbed as a function of the changing variable gives an electron paramagnetic resonance spectrum. Such a spectrum, typically a graph of microwave energy absorption versus applied stationary magnetic field, is used to identify paramagnetic substances and to investigate the nature of chemical bonds within molecules by identifying unpaired electrons and their interaction with the immediate surroundings.

electron scattering, random collisions of the charge carriers (electrons) with atoms in a crystalline solid (*e.g.*, metal, semiconductor, or insulator) that decreases the mobility of the carriers. The deflection of a beam of electrons by a target also is called electron scattering. The scattering of beams of electrons accelerated to more than 100 megaelectron volts has been used as a probe of the size and charge distribution of atomic nuclei. In the early 1970s, electron scattering at energies of several giga-electron volts helped to reveal substructure—*i.e.*, quarks—within protons and neutrons. *See also* electron diffraction.

electron spectroscopy, method of determining the energy with which electrons are bound in chemical species by measuring the kinetic energies of the electrons emitted upon bombardment of the species with X-ray or ultraviolet radiation. Details of the structure may be inferred from the results because differences in the arrangements of the atoms affect the amount of energy required to eject electrons. *See also* Auger effect.

electron synchrotron, type of synchrotron designed to accelerate electrons to high energies (*see* synchrotron).

electron tube, also called VACUUM TUBE, or VALVE, device usually consisting of a sealed glass or metal enclosure that is used in electronic circuitry to control a flow of electrons. The control exerted by such a device may take the form of rectification of an alternating current, amplification of a weak current, or the generation of oscillations, of X rays, or of images on a luminescent screen.

A brief treatment of electron tubes follows. For full treatment, *see* MACROPAEDIA: Electronics.

Thomas Edison was one of the first to observe a flow of current between two separated charged elements (for Edison, a heated filament and a positively charged plate) in an evacuated glass bulb. The Edison effect remained a curiosity until it was shown by Sir J.J. Thomson in 1897 that the discharge observed in the tube was in fact a flow of electrons. From that clue J.A. Fleming designed a two-element tube, called a diode, that, when incorporated into a circuit, acted as a valve by permitting current to flow in one direction only. It could thus rectify an alternating current and, more importantly, serve as a detector of radio waves.

In 1907 the U.S. engineer Lee De Forest built the first triode, or three-element tube, by inserting a grid between the emitting element (filament, later a cathode) and the collecting element (plate, or anode). An electrical potential imposed on the grid could increase or decrease the flow of electrons between the other two elements and thus enable the tube to act as an amplifier. If the current supplied to the grid were a weak signal, the triode tube would produce as its output a strong signal current. The development of practical radio communications derived directly from De Forest's invention.

The typical electron tube consists of a glass or metal envelope from which air has been evacuated, a set of pins at the base by which connections are made to other circuit components, and the internal elements. These last consist of the cathode, usually of tungsten, which supplies electrons by the process of thermionic emission; a heater, or filament, which serves to heat the cathode so that it will emit electrons; the plate, or anode, which collects electrons; and one or more grids, including the basic control grid, a screen grid that increases the amplifying capacity of the tube, and a suppressor grid that controls secondary emission of electrons.

A great variety of tubes have been developed for special purposes. The photoelectric tube contains a cathode made of a material, such as cesium, that emits electrons when struck by light. Electron-gun tubes use an arrangement of internal or external devices to control a beam of electrons from the cathode to a luminescent screen that takes the place of the plate. Cathode-ray tubes and television tubes are among the many types of electron-gun tubes. Other varieties of tubes include the ignitron, used to rectify very large currents in industrial applications, the gas tube, in which ionized mercury vapour carries the current instead of thermionic electrons, the klystron, used to generate extremely high-frequency microwaves, and X-ray tubes, in which the electron beam strikes a target of heavy metal to produce penetrating X rays.

For many applications the electron tube has been supplanted by the semiconductor device (*q.v.*).

electron volt, unit of energy commonly used in atomic and nuclear physics, equal to the energy gained by an electron (a charged particle carrying unit electronic charge when the electrical potential at the electron increases by one volt). The electron volt equals 1.602×10^{-12} erg. The abbreviation MeV indicates 10^6 (1,000,000) electron volts and GeV, 10^9 (1,000,000,000).

electronegativity, in chemistry, the ability of an atom to attract to itself an electron pair shared with another atom in a chemical bond.

The commonly used measure of the electronegativities of chemical elements is the electronegativity scale derived by Linus Pauling in 1932. In it the elements are tabulated in decreasing order of electronegativity, fluorine being the most electronegative and cesium the least. The scale was derived from a comparison of the energies associated with chemical bonds between various combinations of atoms. A scale very similar to Pauling's values has been obtained by measurements of atomic ionization potentials and electron affinities.

Elements differing greatly in electronegativity tend to form ionic compounds, composed of positively and negatively charged units called ions; those differing moderately in electronegativity form polar, covalent compounds, in which atoms are held together by chemical bonds but which show some degree of ionization, while those elements with approximately equal electronegativities form nonpolar compounds, which show little charge separation.

electronic commerce, also called E-COMMERCE, the maintaining of business relationships and the selling of information, services, and commodities by means of computer networks.

E-commerce originated in a standard for the exchange of business documents, such as orders or invoices, between suppliers and their customers. This standard had its inception in the 1948–49 Berlin blockade and airlift. The U.S. Army quickly discovered that normal business transactions—accompanied by paper orders—could not keep up with the necessary flow of goods into Berlin. In order to break the paper bottleneck, Edward Guilbert, a logistics officer in the army, set up a system of ordering via telex, radio-teletype, and telephone. By 1975 the system had evolved into the national electronic data interchange (EDI) standard—unambiguous, independent of any particular machine, and flexible enough to handle most simple electronic transactions.

With the introduction of the first graphical "browser" software for accessing the World Wide Web in 1993, most e-commerce shifted to the Internet. In some fields new Internet retailers grew up, seemingly overnight, to challenge the dominance of traditional retailers. Many established companies embraced the electronic commerce model as well.

As important as standard forms are for business-to-business transactions, e-commerce encompasses much wider activity. For example, secure electronic transfer of sensitive information (such as credit card numbers and electronic funds transfer [EFT] orders) is essential to the continued growth of e-commerce. Other innovations contributing to this growth include electronic directories and search engines for finding information on the Web; software agents that act autonomously to locate goods and services; and digital authentication services that vouch for identities over the Internet. These intermediary services facilitate the sale of goods (actually delivering the goods in the case of information), the provision of services such as banking, ticket reservations, and stock market transactions, and even the delivery of remote education and entertainment. Electronic auctions and reverse markets (where a buyer elicits offers from many sellers) are also components of e-commerce.

Businesses often deploy private networks (intranets) for sharing information and collaborating within the company, usually insulated from the surrounding Internet by computer-security systems known as firewalls. Businesses also frequently rely on extranets, extensions of a company's intranet that allow portions of its internal network to be accessed by collabo-

rating businesses. Access to these extranets is generally restricted via passwords.

Several important phenomena are associated with e-commerce. The role of geographic distance in forming business relationships is reduced. Barriers to entry into the retail business are lower, as it is relatively inexpensive to start a retail Web site. Some traditional business intermediaries are being replaced by their electronic equivalents or are being made entirely dispensable. Prices of commodity products are also generally lower on the Web—a reflection not merely of the lower costs of doing electronic business but of the ease of comparison shopping in cyberspace.

electronic configuration, also called ELECTRONIC STRUCTURE, the arrangement of electrons in energy levels around an atomic nucleus. According to the older shell atomic model, electrons occupy several levels from the first shell nearest the nucleus, *K*, through the seventh shell, *Q*, farthest from the nucleus. In terms of a more refined, quantum-mechanical model, the *K*-*Q* shells are subdivided into a set of orbitals (see orbital), each of which can be occupied by no more than a pair of electrons. The table below lists the number of orbitals available in each of the first four shells.

Orbitals of the first four shells

Shell	Maximum electrons	Orbitals
<i>K</i>	2	1s
<i>L</i>	8	2s, 2p
<i>M</i>	18	3s, 3p, 3d
<i>N</i>	32	4s, 4p, 4d, 4f

The electronic configuration of an atom in the shell atomic model may be expressed by indicating the number of electrons in each shell beginning with the first. For example, sodium (atomic number 11) has its 11 electrons distributed in the first three shells as follows: the *K* and *L* shells are completely filled, with 2 and 8 electrons respectively, while the *M* shell is only partially filled with one electron.

The electronic configuration of an atom in the quantum-mechanical model is stated by listing the occupied orbitals, in order of filling, with the number of electrons in each orbital indicated by superscript. In this notation, the electronic configuration of sodium would be $1s^2 2s^2 2p^6 3s^1$, distributed in the orbitals as 2-8-1. Often, a shorthand method is used that lists only those electrons in excess of the noble gas configuration immediately preceding the atom in the periodic table. For example, sodium has one $3s^1$ electron in excess of the noble gas neon (chemical symbol Ne, atomic number 10), and so its shorthand notation is $[\text{Ne}]3s^1$.

Elements in the same group in the periodic table have similar electronic configurations. For example, the elements lithium, sodium, potassium, rubidium, cesium, and francium (the alkali metals of Group I) all have electronic configurations showing one electron in the outermost (most loosely bound) *s* orbital. This so-called valence electron is responsible for the similar chemical properties shared by the above-mentioned alkali elements in Group I: bright metallic lustre, high reactivity, and good thermal conductivity.

electronic eavesdropping, the act of electronically intercepting conversations without the knowledge or consent of at least one of the participants. Historically, the most common form of electronic eavesdropping has been wiretapping, which monitors telephonic and telegraphic communication. It is legally prohibited in virtually all jurisdictions for commercial or private purposes.

Great controversy has evolved over the use of this technique to detect crime or to gather evi-

dence for criminal prosecution. Opponents assert that the legitimate governmental interest in curtailing crime does not outweigh the great potential for infringing upon constitutional or fundamental guarantees of citizenship, such as individual privacy and freedom from unreasonable searches and seizures.

Wiretapping activities date back to the beginnings of telegraphic communication. In the United States, state statutes forbidding the interception of messages were enacted as early as 1862. The tapping of telephone lines began in the 1890s and was approved for use by police officials in the Supreme Court case of *Olmstead v. United States* (1928). Federal investigative authorities continue to engage in wiretapping, although in 1934 Congress enacted restraints that severely limited the use of intercepted material as admissible evidence in judicial proceedings. In the 1960s and '70s the Supreme Court sought to protect individuals from "unreasonable searches and seizures" by circumscribing prosecution based on electronic surveillance. Some U.S. states prohibit wiretapping completely, whereas others authorize its use pursuant to a valid court order. With the adoption of the Crime Control Act of 1968, Congress authorized the use of electronic surveillance for a variety of serious crimes, subject to strict judicial control.

In England permission to employ a wiretap is granted only in cases of serious offense when interceptions are likely to result in conviction and other methods of investigation have failed. In most other jurisdictions wiretapping is authorized under prescribed circumstances at the request of judicial, prosecuting, or police officials. A court order is ordinarily required, but in some countries, such as Denmark and Sweden, exceptions are recognized in urgent cases.

The typically vague standards governing the use of wiretapping have also provoked controversy with regard to other listening devices. Transistors, microcircuits, and lasers, all products of space-age technology, have revolutionized the art of electronic eavesdropping. One group of the new investigative tools takes the shape of a ray gun that transmits radio waves or laser beams. The ray is directed at the object of the investigation from hundreds of feet away and can imperceptibly pick up a conversation and return it to the listener. The power necessary to transmit a laser beam for carrying voices many miles is extremely small, and a laser beam is more difficult to detect than radio signals.

The most efficient and least expensive form of listening device is a radio transmitter made out of integrated microcircuits. One hundred typical microcircuits can be made on a piece of material smaller and thinner than a postage stamp. A transmitter so constructed can be concealed in a playing card or behind wallpaper.

electronic game, any interactive game operated by silicon-chip computer circuitry that provides a memory. The games fall into three classes: small, hand-held, battery-powered games; medium-sized games displayed on a separate television screen or computer terminal; and large, self-contained games played in arcades. The last two categories are usually called video games.

A brief treatment of electronic games follows. For full treatment, see MACROPAEDIA: Electronic Games.

Electronic games originated late in the 1960s in the off-hour recreations of computer engineers who played games among themselves on computers. Hand-held and video games first appeared in the early 1970s. Coin-operated games, first released in the mid-1970s, displaced the earlier pinball games in popularity by the 1980s. The games were played, as pinball games had been, in drinking establishments, transportation centres, and amusement

arcades. Much of the manufacturing industry was located in the United States and Japan.

The home-use game market fueled industry growth in the 1990s, as industry revenues for electronic games exceeded \$10 billion annually. Home-use games, operated on video game machines and personal computers, were distributed on cartridges, floppy disks, and CD-ROMs (compact disc-read-only memory), as well as through telephone and cable television lines. Typical computer games included sports, adventure, target, and quiz games, as well as such games as chess, blackjack, and backgammon. Although usage was widespread among adults, electronic games were especially popular among children and adolescents, particularly preteen boys.

electronic instrument, any musical instrument that produces or modifies sounds by electric, and usually electronic, means. The electronic element in such music is determined by the composer, and the sounds themselves are made or changed electronically. Instruments such as the electric guitar that generate sound by acoustic or mechanical means but amplify the sound electrically or electronically are also considered electronic instruments. Their construction and resulting sound, however, are usually relatively similar to those of their nonelectronic counterparts.

A brief treatment of electronic instruments follows. For full treatment, see MACROPAEDIA: Musical Instruments.

The origins of electronic music go back to the 200-ton, telharmonium exhibited by the American inventor Thaddeus Cahill in Massachusetts and New York in 1906. More manageable electronic instruments were subsequently built in the 1920s and '30s, most notably various electronic organs (such as the Hammond organ) and the Ondes Martenot of the French inventor Maurice Martenot, which has an important place in the French composer Olivier Messiaen's *Turangalila-Symphonie* (1946-48) and other works. Meanwhile other composers, including the Frenchman Edgard Varèse and the German Paul Hindemith, were exploring the possibilities of transforming sounds with the use of the phonograph, or gramophone: playing records at different speeds, backwards, and so on.

Such sound-manipulation techniques became much easier to use when tape recorders became available about 1950. The development of tape music then began in earnest, led by the French composer Pierre Schaeffer, who established a studio in Paris for what he called *musique concrète*. His work attracted the attention of several composers, notably Varèse, who worked there in 1954 on the tape for his *Déserts*, interweaving orchestral passages with electronic excursions. He used similar techniques of assembling purely electronic sounds with natural sounds (factory noises and music from instruments and voices) in his *Poème électronique* (1957-58), which exists entirely on tape.

Besides this kind of collage work, there were also in the 1950s attempts to produce music solely by electronic means of generation, by deriving tones from oscillators, recording them on tape, and perhaps modifying or editing them at will. A notable example of such a device is the theremin (*q.v.*), which in its original form was not actually touched by the performer. The German composer Karlheinz Stockhausen created his *Elektronische Studien* (1953-54) by means of oscillators, at the studio for *elektronische Musik* established in Cologne in 1951.

Other technological advances after World War II led to the design of various score-reading instruments that were programmed by punched cards or rolls rather than controlled

by conventional keyboards or fingerboards. Perhaps the most successful instrument of this type was the RCA Electronic Music Synthesizer (called the Mark II) installed in 1951 at the Columbia-Princeton Electronic Music Center in New York City. Despite its name, the RCA Synthesizer was not a synthesizer in the modern sense. It was designed to be used in a studio as a composition aid and not for real-time, live performance. The American composer Milton Babbitt frequently employed the Mark II in his works.

A third significant postwar development was the rapid growth of the market for electronic organs, especially for home use. This wide acceptance of an electronic instrument, combined with advances in tape music and the score-reading instruments, helped prepare the way for the next stage of development: the introduction of the music synthesizer (*q.v.*). The first synthesizers were actually systems of compatible, interchangeable electronic components. When these components, or modules, were connected, they enabled the composer or musician not only to produce but also to process sounds with unprecedented flexibility. These synthesizers were usually equipped with a piano-style keyboard or other manual control device to facilitate use and were soon being played in live performances. The two best known of the early synthesizers were those designed by the American inventors Robert A. Moog and Donald F. Buchla, both introduced in 1964. As synthesizers became more compact and generally available, they were quickly adopted by popular musicians—sometimes to the exclusion of all other types of instruments.

The main development of the 1970s, though initiated in the previous decade, was the increasing use of the computer as a musical tool. Computer music appealed to composers interested in a high degree of exact control (as exerted, for example, in the American composer Charles Dodge's tape pieces), but it also proved a suitable medium for composers inclined, like John Cage in his various electronic works dating back to the 1930s, to use electronic imagery to stimulate a new kind of consciousness brought into being by the electronic age. By the 1980s, digital computer techniques were being used to control every aspect of sound: pitch, colour, loudness, and the change of these qualities in real-time. It also became possible to sample (digitally record) any sound for playback on a synthesizer.

electronic mail, abbreviation E-MAIL, messages transmitted and received by digital computers through a network. An electronic-mail, or E-mail, system allows computer users on a network to send text, graphics, and sometimes sounds and animated images to other users.

On most networks, data can be simultaneously sent to a universe of users or to a select group or individual. Network users typically have an electronic mailbox that receives, stores, and manages their correspondence. Recipients can elect to view, print, save, edit, answer, or otherwise react to communications. Many E-mail systems have advanced features that alert users to incoming messages or permit them to employ special privacy features. Large corporations and institutions use E-mail systems as an important communication link among employees and other people allowed on their networks. E-mail is also available on major public on-line and bulletin board systems, many of which maintain free or low-cost global communication networks.

electronic organ, also called ELECTRIC ORGAN, or ELECTROPHONIC ORGAN, keyboard musical instrument in which tone is generated by electronic circuits and radiated by loudspeaker. This instrument, which emerged

in the early 20th century, was designed as an economical and compact substitute for the much larger and more complex pipe organ.

The electronic organ resembles a spinet, or upright, piano in size and general shape. Most instruments of this general type rely upon elec-

Electronic organ
By courtesy of Hammond Organ Co

tronic oscillators (circuits carrying an alternating current at a specific frequency) to produce their sound. Each oscillator is capable of frequency variation for different pitches and is capable of reproducing a single melodic line. The instrument's multiple oscillators make it capable of reproducing music having multiple parts, such as a fugue by Johann Sebastian Bach.

The 200-ton, keyboard-operated telharmonium, which used rotating electromagnetic tone-wheels to generate sound, was an important precursor to the electronic organ. Made in 1904 by the American inventor Thaddeus Cahill, it was exhibited in Massachusetts and New York in 1906 but lapsed into obscurity by World War I. The first successful electronic organ was developed in 1928 in France by Edouard Coupleux and Armand Givelet. It used electronic oscillators in place of the pipes of a conventional organ and was operated with keyboards and a pedal board. Another notable early electronic organ was the Ranger-tone (1931), invented by Richard H. Ranger of the United States. In 1934 the Orgatron was introduced by Frederick Albert Hoshck; in this organ, tone was generated by reeds that vibrated by electrically fan-blown air, with the vibrations picked up electrostatically and amplified.

One of the most important and well known of the electronic organs is the Hammond organ, a sophisticated instrument having two manuals, or keyboards, and a set of pedals operated by the feet. It was patented by its American inventor Laurens Hammond in 1934. Unlike most other instruments of its type, it produces its sound through a complex set of rotary, motor-driven generators. By means of a series of controls affecting the harmonics, or component tones, of the sound, a great variety of timbres (tone colours) can be reproduced that to some degree imitate the sound of other instruments, such as the violin, the flute, the oboe, and the orchestral percussion instruments.

By the 1960s organ manufacturers had expanded their technology, supplanting vacuum tubes with transistors and solid-state circuitry. Circuits and components designed to operate television and radio receivers and high-fidelity phonographs were adapted to produce music. In the 1970s digital microcircuitry was used to operate a computer organ. In this device, sounds are not created internally but have been prerecorded (sampled) and stored in the computer from which they can later be retrieved. Musical tones or shapes—recorded

from conventional windblown pipe organs—are coded into digital form and may be recreated by a special computer at the touch of the keys and stops. Other devices have been used to control reverberation, pitch, and the attack or delay of a note.

electronic sound synthesizer: see music synthesizer.

electronic structure: see electronic configuration.

electronic work function, energy (or work) required to withdraw an electron completely from a metal surface. This energy is a measure of how tightly a particular metal holds its electrons—that is, of how much lower the electron's energy is when present within the metal than when completely free. The work function is important in applications involving electron emission from metals, as in photocells (electric eyes) and vacuum tubes.

The value of the work function for a particular material varies slightly depending upon the process of emission. For example, the energy required to boil an electron out of a heated platinum filament (thermionic work function) differs slightly from that required to eject an electron from platinum that is struck by light (photoelectric work function). Typical values for metals range from two to five electron volts.

When metals of different work functions are joined, electrons tend to leave the metal with the lower work function (where they are less tightly bound) and travel to the metal of higher work function. This effect must be considered whenever connections are made between dissimilar metals in certain electronic circuits.

Because some electrons in a material are held more tightly than others, a precise definition of work function specifies which electrons are involved, usually those most loosely bound.

*A list of the abbreviations used
in the MICROPAEDIA will be found
at the end of this volume*

electronics, branch of physics that deals with the emission, behaviour, and effects of electrons (as in electron tubes and transistors) and with electronic devices.

A brief treatment of electronics follows. For full treatment, see MACROPAEDIA: Electronics.

The beginnings of electronics can be traced to various experiments with electricity. In the 1880s Thomas A. Edison and others observed the flow of current between elements in an evacuated glass tube. Edison, who was experimenting to improve his incandescent light bulb, added a second element near the filament in the tube. Under certain conditions, he noticed a bluish glow in the tube. This "Edison effect" remained unexplained and unexploited for some years. In 1897 the British physicist J.J. Thomson determined that the Edison effect was due to the emission and passage of particles; through experiment, he identified these particles as electrons. A short time later the English engineer John A. Fleming constructed the so-called thermionic valve (a two-electrode thermionic vacuum tube) by which an electrical current could be restricted to flow only in one direction. This rectifying process, also known as detection and demodulation, produced an output current that could be used to operate a telephone receiver or recording device. Fleming's valve was greatly improved in 1907 by the American engineer Lee De Forest, who added a third element to the evacuated tube and produced the first triode, which could greatly amplify an electrical signal. From the triode the forms of the electron tube (*q.v.*) multiplied, giving rise to photomultiplier tubes, klystrons, magnetrons, and so forth.

In 1947 three scientists at Bell Laboratories—John Bardeen, William B. Shockley, and Walter H. Brattain—introduced the transistor, a simple device consisting of a small block of a semiconductor (*q.v.*) with three electrodes that could perform many of the functions of electron tubes. The invention of the transistor initiated a progressive miniaturization of electronic components that by the mid-1990s resulted in the manufacture of solid-state devices that contained more than 20,000,000 transistors on a single tiny silicon chip. Such high-density microcircuits, called microprocessors, have led to tremendous advances in computer technology and in computer-based automated systems (*e.g.*, industrial robots and spacecraft-control systems). The availability of inexpensive microprocessors has also brought about the computerization of an enormous array of consumer products, ranging from self-focusing cameras and self-tuning televisions to programmable videocassette recorders and security systems. In addition, developments in optoelectronics (*i.e.*, an approach that makes use of both optical and electronic phenomena) have yielded efficient photodetectors and solar cells, as well as light-emitting diodes, semiconductor lasers, and optical fibres that are integral to many advanced communications systems.

electrophile, in chemistry, an atom or a molecule that in chemical reaction seeks an atom or molecule containing an electron pair available for bonding. Electrophilic substances are Lewis acids (compounds that accept electron pairs), and many of them are Brønsted acids (compounds that donate protons). Examples of electrophiles are hydronium ion (H_3O^+ , from Brønsted acids), boron trifluoride (BF_3), aluminum chloride ($AlCl_3$), and the halogen molecules fluorine (F_2), chlorine (Cl_2), bromine (Br_2), and iodine (I_2). *Compare* nucleophile.

electrophone, any of a class of musical instruments in which the initial sound either is produced by electronic means or is conventionally produced (as by a vibrating string) and electronically amplified. Electronically amplified conventional instruments include guitars, pianos, and others.

Among instruments that use electronic means of generating sound are the theremin, the ondes martenot, electronic organs, and electronic music synthesizers. The vibraphone, or vibraharp, a metallophone that looks somewhat like the orchestral xylophone, makes use of electric fans at the upper ends of the vibrator tubes in order to produce a vibrato sound. *Compare* aerophone; chordophone; idiophone; membranophone.

electrophoresis, also called **CATAPHORESIS**, the movement of electrically charged particles in a fluid under the influence of an electric field. If the liquid rather than the particles is set in motion—*e.g.*, through a fixed diaphragm—the phenomenon is called **electroosmosis**.

Electrophoresis is used to analyze and separate colloids (*e.g.*, proteins) or to deposit coatings, as on elements used in electron tubes.

About 1930 the Swedish chemist Arne Tiselius introduced the use of electrophoresis as an analytic technique. Tiselius originated the moving-boundary method of observation, in which a layer of pure (*i.e.*, without particles) fluid is placed over a quantity of the same fluid containing colloidal particles; the boundary between two layers of fluid is visible and moves at the speed of electrophoresis of the particles.

electrophotography, any of several image-forming processes, principally xerography and the dielectric process, that rely on photoconductive substances whose electrical resistance decreases when light falls on them; it is the basis of the most widely used document-copying machines.

In xerography, a light exposure is made upon a uniformly charged metal plate, the selenium coating of which then selectively destroys the charge in conformity with the original. The image is made visible by dusting the plate with an oppositely charged pigmented powder; it is then transferred to paper electrostatically and fused with heat. Modern xerographic machines use a continuously rotating metal drum on which the various steps—charging, exposing, developing, and transferring—are carried out continuously.

A proprietary process known as Electrofax employs a photographic paper coated with a dielectric layer; the entire charging, exposure, and development process is thus effected directly on the paper itself.

electroplating, process of coating with metal by means of an electric current. Plating metal may be transferred to conductive surfaces (metals) or to nonconductive surfaces (plastics, wood, leather) after the latter have been rendered conductive by such processes as coating with graphite, conductive lacquer, electroless plate, or a vaporized coating.

Figure 1 shows a typical plating tank containing copper sulfate ($CuSO_4$) solution. A

Figure 1: Electroplating circuit

dynamo supplies electric current, which is controlled by a rheostat. When the switch is closed, the cathode bar, which holds the work to be plated, is charged negatively. Some of the electrons from the cathode bar transfer to the positively charged copper ions (Cu^{2+}), setting them free as atoms of copper metal. These copper atoms take their place on the cathode surface, copperplating it. Concurrently, as shown in the drawing, the same number of sulfate ions (SO_4^{2-}) are discharged on the copper anodes, thereby completing the electrical circuit. In so doing, they form a new quantity

of copper sulfate that dissolves in the solution and restores it to its original composition. This procedure is typical of nearly all ordinary electroplating processes; the current deposits a given amount of metal on the cathode and the anode dissolves to the same extent, maintaining the solution more or less uniformly. If this balance is perfect and there are no side reactions or losses, a 100 percent cathode efficiency and 100 percent anode efficiency could possibly be realized.

If the metal surface of the cathode is chemically and physically clean, the discharged atoms of copper are deposited within normal interatomic spacing of the atoms of the basis metal and attempt to become an integral part of it. In fact, if the basis metal is copper, the new copper atoms will frequently arrange themselves to continue the crystal structure of the basis metal, the plate becoming more or less indistinguishable from and inseparable from the basis metal.

If suitable solutions of different metals are mixed, it is possible to plate a wide variety of alloys of metals. By this means plated brass can be made more or less indistinguishable from cast brass. It is also possible, however, to deposit alloys or compounds of metals that cannot be produced by melting and casting them together. For example, tin-nickel alloy plate has been used commercially for its hardness and corrosion resistance, which are superior to that of either metal alone. The deposit consists of a tin-nickel compound ($Sn-Ni$) that cannot be produced in any other way.

Other common alloy plates include bronze and gold, with varying properties, such as different colours or hardnesses. Magnetic alloy plates of such metals as iron, cobalt, and nickel are used for memory drums in computers. Solder plate ($Sn-Pb$) is used in printed circuit work.

Development of electroplating. While some metal coating procedures date back to ancient times, modern electroplating started in 1800 with Alessandro Volta's discovery of the voltaic pile, or battery, which made noteworthy quantities of direct current electricity available. At about the same time, the battery was employed to deposit lead, copper, and silver. After a nodule of copper had been deposited on a silver cathode, the copper could not be removed. In the same year, zinc, copper, and silver were deposited on themselves and on a variety of basis metals (the metals on which the plating is applied), such as gold and iron.

Electroplating on a commercial scale was begun about 1840-41 and was accelerated by the discovery of cyanide solutions for plating silver, gold, copper, and brass. A cyanide-copper solution, for example, gave adherent deposits of copper directly on iron and steel. A cyanide-copper solution is still used for this purpose and also for the initial plating on zinc die castings. The copper sulfate solution described above corrodes these metals, giving nonadherent deposits.

Electroplating has become a large and grow-

Figure 2: Periodic chart of metals readily plated

ing industry with sophisticated engineering and equipment requirements. The metals that can be readily plated from aqueous solutions at high-current efficiencies near 100 percent can best be surveyed from Figure 2. It shows these metals in a single rectangle in their proper relationship to each other. The only metal shown outside the rectangle that is in common use is chromium, which is usually plated at low-current efficiencies of about 10–20 percent. Iron, cobalt, nickel, copper, zinc, ruthenium, rhodium, palladium, silver, cadmium, tin, iridium, platinum, gold, and lead are more or less commonly used for plating. The others can be deposited easily but have not found much use in this way either owing to cost or availability or lack of useful properties.

The introduction of chromium plating in 1925 stimulated repercussions all through the plating industry. Chromium was essentially a bright plate and retained its brightness indefinitely. Chromium plate found a ready market in the automotive and appliance fields, in which the merits of the combination plate nickel-chromium or copper-nickel-chromium were soon proven. The requirements for closer control procedures in bath composition, temperature, and current density were reflected in better control and development of other processes.

So-called hard-chromium plating likewise created a new way of improving the wear resistance of machine parts and improving their operation owing to good frictional and heat resistance properties. Worn or undersized parts were built up with chromium plate.

While nonmetallic materials have been plated since the mid-19th century, a period of rapid growth in the utilization of electroplated plastics began in 1963 with the introduction of ABS plastic (acrylonitrile-butadiene-styrene), which was readily plated. The plastic part is first etched chemically by a suitable process, such as dipping in a hot chromic acid-sulfuric acid mixture. It is next sensitized and activated by first dipping in stannous chloride solution and then in palladium chloride solution. It is then coated with electroless copper or nickel before further plating. A useful degree of adhesion is obtained (about 1 to 6 kg per cm [5 to 30 pounds per inch]) but is in no way comparable to the adhesion of metals to metals.

Principal applications. Copperplating is used extensively to prevent case hardening of steel on specified parts. The entire article may be copperplated and the plate ground off on the areas to be hardened. Silver plating is used on tableware and electrical contacts; it has also been used on engine bearings. The most extensive use of gold plating is on jewelry and watch cases. Zinc coatings prevent the corrosion of steel articles, while nickel and chromium plate are used on automobiles and household appliances.

electroshock therapy: see shock therapy.

electrovalent bond: see ionic bond.

electroweak theory, the theory that describes both the electromagnetic force and the weak nuclear force. Superficially, these forces appear quite different. The weak force acts only across distances smaller than the atomic nucleus, while the electromagnetic force can extend across substantial stretches of space (e.g., as observed in thunderstorms), weakening only with the square of the distance. Moreover, within the nucleus, the weak force is some 1,000,000 times weaker than the electromagnetic force. Yet, one of the major discoveries of the 20th century has been that these two forces are different facets of the same, more fundamental force. (See also fundamental interaction.)

The electroweak theory arose principally out of attempts to produce a self-consistent theory for the weak force, in analogy with quantum electrodynamics (QED), the successful quantum theory of the electromagnetic force developed during the 1940s. The two basic requirements for the theory of the weak force are, first, that it should be gauge invariant (i.e., it should behave in the same way at different points in space and time) and, second, that it should be renormalizable (i.e., it should not contain nonphysical infinite quantities).

During the 1960s Sheldon Glashow, Abdus Salam, and Steven Weinberg independently discovered that they could construct a gauge-invariant theory of the weak force, provided that they also included the electromagnetic force. To mediate the interactions, the new theory predicts the existence of four massless, "messenger" particles, two charged and two neutral. The short range of the weak force indicates, however, that it is carried by massive particles. This implies that the underlying symmetry of the theory is hidden, or "broken," by some mechanism that gives mass to the particles exchanged in weak interactions but not to the photons exchanged in electromagnetic interactions. The assumed mechanism involves an additional interaction with an otherwise unseen field, called the Higgs field, that pervades all space.

In 1971 Gerard 't Hooft proved that the unified electroweak theory proposed by Glashow, Salam, and Weinberg was renormalizable, and the theory gained full respectability. Later, experiments revealed the existence of the weak messengers, the neutral Z particle and the charged W particles; the masses of these particles were as predicted by the theory. (See also standard model.)

electrum, natural or artificial alloy of gold with at least 20 percent silver, which was used to make the first known coins in the Western world. Most natural electrum contains copper, iron, palladium, bismuth, and perhaps other metals. The colour varies from white-gold to brassy, depending on the percentages of the major constituents and copper. In the ancient world the chief source was Lydia, in Asia Minor, where the alloy was found in the area of the Pactolus River, a small tributary of the Hermus (modern Gediz Nehri, in Turkey). The first Occidental coinage, possibly begun by King Gyges (7th century BC) of Lydia, consisted of irregular ingots of electrum bearing his stamp as a guarantee of negotiability at a predetermined value.

elegy, meditative lyric poem lamenting the death of a public personage or of a friend or loved one; by extension, any reflective lyric on the broader theme of human mortality. In classical literature an elegy was simply any poem written in the elegiac metre (alternating lines of dactylic hexameter and pentameter) and was not restricted as to subject. In some modern literatures, such as German, in which the classical elegiac metre has been adapted to the language, the term elegy refers to this metre, rather than to the poem's content. Thus, Rainer Maria Rilke's famous *Duineser Elegien* (*Duino Elegies*) are not laments; they deal with the poet's search for spiritual values in an alien universe. But in English literature since the 16th century, an elegy has come to mean a poem of lamentation. It may be written in any metre the poet chooses.

A distinct kind of elegy is the pastoral elegy, which borrows the classical convention of representing its subject as an idealized shepherd in an idealized pastoral background and follows a rather formal pattern. It begins with an expression of grief and an invocation to the Muse to aid the poet in expressing his suffering. It usually contains a funeral procession, a description of sympathetic mourning throughout nature, and musings on the unkindness of death. It ends with acceptance, often a very af-

firmative justification, of nature's law. The outstanding example of the English pastoral elegy is John Milton's "Lycidas" (1638), written on the death of Edward King, a college friend. Other notable pastoral elegies are Percy Bysshe Shelley's "Adonais" (1821), on the death of the poet John Keats, and Matthew Arnold's "Thyrsis" (1867), on the death of the poet Arthur Hugh Clough.

Other elegies observe no set patterns or conventions. In the 18th century the English "graveyard school" of poets wrote generalized reflections on death and immortality combining gloomy, sometimes ghoulish imagery of human impermanence with philosophical speculation.

Representative works are Edward Young's *Night Thoughts* (1742–45) and Robert Blair's *Grave* (1743), but the best known of these poems is Thomas Gray's more tastefully subdued creation "An Elegy Written in a Country Church Yard" (1751), which pays tribute to the generations of humble and unknown villagers buried in a church cemetery. In the United States, a counterpart to the graveyard mode is found in William Cullen Bryant's "Thanatopsis" (1817). A wholly new treatment of the conventional pathetic fallacy of attributing grief to nature is achieved in Walt Whitman's "When Lilacs Last in the Door-yard Bloom'd" (1865–66).

In modern poetry the elegy remains a frequent and important poetic statement. Its range and variation can be seen in such poems as A.E. Housman's "To an Athlete Dying Young," W.H. Auden's "In Memory of W.B. Yeats," e.e. cummings' "my father moved through dooms of love," and John Peale Bishop's "Hours" (on F. Scott Fitzgerald).

Elektrostal, formerly (until 1938) ZATISHYE, city, Moscow oblast (province), western Russia. It lies 36 miles (58 km) east of Moscow city. The name, meaning "electric steel," derives from the high-quality-steel industry established there soon after the October Revolution in 1917. During World War II, parts of the heavy-machine-building industry were relocated there from Ukraine, and Elektrostal is now a centre for the production of metallurgical equipment. Pop. (1992 est.) 153,000.

element, chemical: see chemical element.

element 109: see unnilennium.

elementary education, also called PRIMARY EDUCATION, the first stage traditionally found in formal education, beginning at about age 5 to 7 and ending at about age 11 to 13. In the United Kingdom and some other countries, the term primary is used instead of elementary. In the United States the term primary customarily refers to only the first three years of elementary education—i.e., grades 1 to 3. Elementary education is often preceded by some form of preschool for children age 3 to 5 or 6 and is often followed by secondary education (*q.v.*).

Despite the many cultural and political differences among nations, the objectives and curriculum at least of elementary education tend to be similar. Nearly all nations are officially committed to mass education, which is viewed as eventually including a full elementary education for all. An increasing agreement may therefore be found among nations to the effect that preparation for citizenship is one of the major objectives of elementary education. In terms of curriculum, this objective suggests an emphasis on reading and writing skills, arithmetic skills, and basic social studies and science.

In the French system, children age 6 to 11 at-

tend the *école primaire élémentaire*. The United States, which has a decentralized system of education, generally has nursery schools and kindergartens integrated with the elementary schools. The elementary-secondary sequence overall is 12 years long (not counting a one- or two-year kindergarten), but the subdivision of these years varies, including eight-four or six-six (elementary school and high school), six-three-three (elementary school, junior high school, and senior high school), and four-four-four (primary school, middle school, and high school), and some modifications of these patterns.

Compulsory education in England begins at age 5 and continues to age 16. Formal school attendance begins at age 5, when the child enters the two-year infant school or department. Thereafter students may attend junior school until age 11. Some local authorities, however, have established "first" schools for pupils of ages 5 to 8, 9, or 10 and "middle" schools for various age ranges between ages 8 and 14. In Canada the elementary school, depending upon the province, may be 8, 7, or 6 years in length. In Australia compulsory attendance begins at the age of 6 and extends to 15 in five states and to 16 in Tasmania. As a general rule, elementary and secondary education last six years each.

The contemporary Japanese school system consists of a three-year kindergarten, a six-year elementary school, a three-year lower secondary school, and a three-year upper secondary school. In India each state has a director of public education who, among his other tasks, is responsible for the inculcation of basic education through productive activity and local crafts to all children between the ages of 6 and 14. In the Indian curricular system, the student may begin an eight-year elementary school at the age of 6 and may possibly move on to a three-year secondary school and a three-year college, which constitute the higher scholastic organization. Other national variations of the elementary school offer four- and six-year programs that are followed by a three-year junior secondary or middle school and a three-year secondary school.

Elementary schools in most nations introduce the child first to the local environment and then systematically bring him into contact with larger environments. The way in which this is done, the relative emphasis on factual knowledge, the relative attention to the concept of culture, and the degree of pupil involvement in the design of the learning experiences may vary greatly from nation to nation or even between educational systems. Nevertheless, the principle that a child's learning should move from the immediate and familiar to the distant and unfamiliar appears to be widely accepted.

Great variation therefore exists within nations and internationally regarding such characteristics as the degree of stress placed on textbook learning, the degree of religious and ideological training, and the relationship between teachers and students. It should be noted that in some nations, such as Spain, Ireland, and some Muslim countries, religious and denominational influences control the school systems. In other countries (e.g., the United States), ecclesiastical and other religious bodies maintain elementary, secondary, and higher schools separate from the public-school systems.

Viewed globally, several factors continue to be potent determinants of change in elementary education. One factor is the expansion of enrollments resulting from population growth and an increased public desire for the fruits of schooling. A second factor is the social pressure for equalizing educational opportunity between social classes, ethnic and racial groups, rural and urban populations, and the sexes.

There is a close relationship between the educational provisions of a country and its eco-

nomical resources. This relationship shows up in such country-to-country comparisons as the percentages of children between the ages of 5 and 14 enrolled in school, the number who begin but soon drop out, the supply and qualifications of teachers, and so on. In all of these respects, large sections of Africa, Latin America, and parts of Asia and the Middle East are disadvantaged when compared with most of Europe and with countries such as the United States, Canada, Japan, and Australia.

The most critical problem of education in the world's developing countries is that of providing elementary schooling for all or even most of their children, and the second most critical problem then becomes one of keeping those children in school. The goal of literacy, which is central to elementary education everywhere, is frustrated not only when a small percentage of the people go to school but also when relatively few of those who do attend advance beyond the first or second grade. In some developing countries, for example, only one or two children out of five who go to school remain there until the fifth grade. A concentration of enrollment in the first grade or two is characteristic of underdeveloped school systems, partly because of the dropout problem and partly because many of those who stay on fail to meet requirements for promotion to the next grade.

Unfortunately, the rapid educational expansion that took place in many developing countries in the second half of the 20th century was offset by equally rapid population growth. Each year more children go to school, but there are still more to be educated. Consequently, facilities and a supply of well-trained teachers lag far behind the seemingly endless need.

An earlier preoccupation with the sheer quantitative problems of providing schooling for all children has been replaced in developed nations with a growing concern for persistent inequities in the quality of schooling provided various segments of the population. Where responsibility for education is decentralized to small local units, the quality of schooling provided from community to community often varies profoundly. Wealthy families often become dissociated from the educational needs of the rest of society because their children go to private schools. Or they join others like themselves in suburbs where their taxes support small classes, ample supplies of learning materials and equipment, and relatively well-paid teachers. The communities that they left are disadvantaged in the struggle to provide quality schooling for all. In the second half of the 20th century, one of the most vigorously debated educational topics of the United States was whether black and Hispanic children of the inner cities did indeed have equal educational opportunity so long as they were cut off, both in and out of school, from association with those more prosperous segments of the population that enjoyed the fruits of high-quality education owing to their greater financial resources.

For international statistical data on elementary-school systems, see *BRITANNICA BOOK OF THE YEAR*.

elephant (family Elephantidae), largest living land animal, characterized by its long trunk (elongated upper lip and nose), columnar legs, and huge head with temporal glands and wide, flat ears. Elephants are grayish to brown in colour, and their body hair is sparse and coarse. They are found most often in savannas, grasslands, and forests but occupy a wide range of habitats, including deserts, swamps, and highlands in tropical and subtropical regions of Africa and Asia.

The African savanna, or bush, elephant (*Loxodonta africana*) weighs up to 8,000 kg (9 tons) and stands 3 to 4 m (10 to 13 feet) at the shoulder. The African forest elephant (*L. cyclotis*) was recognized as a separate species in 2000 and is smaller than the savanna elephant.

Indian elephant (*Elephas maximus*), (bottom)
African elephant (*Loxodonta africana*)

E. S. Ross (bottom) A. J. Brown/Media Library, Inc./R. B. Langley

Living in rainforests, it has slender, downward-pointing tusks. The common belief that there existed "pygmy" and "water" elephants has no basis; they are probably varieties of the African forest elephants.

The Asian elephant (*Elephas maximus*) weighs about 5,500 kg and has a shoulder height of up to 3.5 m. The Asian elephant includes three subspecies: the Indian, or mainland (*E. m. indicus*), the Sumatran (*E. m. sumatranus*), and the Sri Lankan (*E. m. maximus*). African elephants have much larger ears, which are used to dissipate body heat.

Form and function. The trunk, or proboscis, of the elephant is one of the most versatile organs to have evolved among mammals. This structure is unique to members of the order Proboscidea, which includes the extinct mastodons and mammoths. The trunk is large and powerful, weighing about 130 kg (290 pounds) in an adult male and capable of lifting a load of about 250 kg. However, it is also extremely dexterous, mobile, and sensitive, which makes it appear almost independent of the rest of the animal. Within the trunk is an extremely complex network of radiating and transverse muscle fascicles that provide fine movement. At the end of the trunk are flaplike projections enabling it to perform amazingly delicate functions, such as picking up a coin from a flat surface. African elephants have two such extremities (one above and one below); Asian elephants have one.

Elephants use the trunk like a hand in other ways as well. Tool use in elephants involves holding branches and scratching themselves in places that their trunk and tail cannot reach. Large branches are sometimes wielded, and

objects may be thrown in threat displays. When elephants meet, one may touch the face of the other, or they will intertwine trunks. This "trunk-shake" can be compared to a human handshake in that it may be associated with similar functions such as assurance and greeting or as a way of assessing strength.

Breathing, drinking, and eating are all vital functions of the trunk. Most breathing is performed through the trunk rather than the mouth. Elephants drink by sucking as much as 10 litres (2.6 gallons) of water into the trunk and then squirting it into the mouth. They eat by detaching grasses, leaves, and fruit with the end of the trunk and using it to place this vegetation into the mouth. The trunk is also used to collect dust or grass for spraying onto themselves, presumably for protection against insect bites and the sun. If danger is suspected, elephants raise and swivel the trunk as if they were "an olfactory periscope," possibly sniffing the air for information.

Elephants produce two types of vocalization by modifying the size of the nostrils as air is passed through the trunk. Low sounds are the growl, rolling growl, snort, and roar; high sounds are the trump, trumpet, pulsated trumpet, trumpet phrase, bark, gruff cry, and cry. Rumbling sounds initially thought to be caused by intestinal activity are considered to be similar to purring in cats. Lower-frequency (5–24 hertz) calls are produced by the pharyngeal pouch. These infrasonic calls are responded to by other elephants up to 4 km (2.5 miles) away. In addition to sound production, the pharyngeal pouch is presumed to be used for carrying water.

Elephant tusks are enlarged incisor teeth made of ivory. In the African elephant both the male and the female possess tusks, whereas in the Asian elephant it is mainly the male that has tusks. When present in the female, tusks are small, thin, and often of a uniform thickness. Some male Asian elephants are tuskless and are known as *muknas*. Tusk size and shape are inherited. Tusks are used for defense, offense, digging, lifting objects, gathering food, and stripping bark to eat from trees. They also protect the sensitive trunk, which is tucked between them when the elephant charges. In times of drought, elephants dig water holes in dry river beds by using their tusks, feet, and trunks.

Elephants have six sets of cheek teeth (molars and premolars) in their lifetime, but they do not erupt all at once. At birth an elephant has two or three pairs of cheek teeth in each jaw. New teeth develop from behind and slowly move forward as worn teeth fragment in front and either fall out or are swallowed and excreted. Each new set is successively longer, wider, and heavier. The last molars can measure nearly 40 cm (almost 16 inches) long and weigh more than 5 kg (about 11 pounds). Only the last four molars or their remains are present after about 60 years of age.

Life cycle. Elephants live in small family groups led by old females (cows). Where food is plentiful, the groups join together. Most males (bulls) live in bachelor herds apart from the cows. Males and females both possess two glands that open between the eye and ear. Elephants of all ages and sexes secrete a fluid called temporin out of this orifice. Males, however, enter a "musth period," during which they secrete a fluid differing in viscosity from the fluid secreted when they are not in musth. Serum testosterone during musth is higher than in a nonmusth elephant, and the animal's behaviour is erratic; they are uncontrollable (*musth* is Hindi for "intoxicated"), sometimes even by their own handlers (mahouts). Musth is the time for establishing reproductive hierarchy, which can differ from

the usual social hierarchy in that a male in musth outranks nonmusth males.

Gestation is the longest of any mammal (18–22 months). The newborn elephant is about a metre (3.3 feet) tall and weighs about 100 kg (220 pounds). It suckles by using the mouth, not the trunk, at mammary glands located in the chest region. An adult elephant consumes about 100 kg of food and 100 litres (26 gallons) of water per day; these amounts can double for a hungry and thirsty individual. Such consumption makes elephants an important ecological factor; they substantially affect and even alter the ecosystems they live in.

Elephants migrate seasonally according to the availability of food and water. Memory plays an important role during this time, as they remember locations of water supplies along migration routes.

Although unable to jump or gallop, elephants can reach a top speed of 40 km (25 miles) per hour. Their feet are well adapted to carrying their great weight. The heel is partially elevated, and below it is a thick fatty, fibrous wedge of tissue protected by thick skin. It is not easy for elephants to lie down and get up; they sleep lying down for three to four hours during the night. While standing, elephants doze for short periods but do not sleep deeply. Elephants can live to 80 years of age or more in captivity but to about 60 in the wild. Evidence does not substantiate the existence of so-called "elephant graveyards," where elephants supposedly gather to die.

Importance to man. For many centuries the Asian elephant has been important as a ceremonial and draft animal. Technically, elephants have not been domesticated, for they have not been subjected to selective breeding for "improvement" of traits desired by humans, as has been the practice with cattle, horses, and dogs. Historical records of tamed Asian elephants date to the Indus civilization of the 3rd millennium BC.

Mahouts and oozies (elephant trainers in India and Myanmar, respectively) are skilled people who remain in direct contact with the animals for many years. The handlers take care of the elephants, and the bond between man and beast becomes very strong. Once basic to Southeast Asian logging operations, the elephant has been largely supplanted by machinery, but it remains a symbol of power and pageantry. At the beginning of the 21st century, Thailand and Myanmar each had about 5,000 captive elephants employed in traditional roles intermingled with modern use as tourist attractions.

Conservation. At the beginning of the 21st century, fewer than 50,000 Asian elephants remained in the wild. Threatened by habitat loss and poaching, Asian and African elephants are listed as endangered species. From 1979 to 1989 the number of African elephants in the wild was reduced by more than half, from 1,300,000 to 600,000, due in part to commercial demand. Botswana, Namibia, Zimbabwe, and South Africa sell limited amounts of ivory from existing stocks. (Je.S.)

Elephant Man, byname of JOSEPH CAREY MERRICK (b. Aug. 5, 1862, Leicester, Leicestershire, England—d. April 11, 1890, London), disfigured man who, after a brief career as a professional "freak," became a patient of London Hospital from 1886 until his death.

Merrick was apparently normal until about the age of five, when he began showing signs of a strange disorder that caused abnormal growths of much of his skin and bone. The size of his head increased to 3 feet (almost 1 metre) in circumference, with spongy skin hanging from the back of his head and across his face; deformation of the jaws rendered him incapable of showing facial expression or speaking clearly. Although his left arm was normal, his right arm ended in a wrist that was 12 inches (30 cm) in circumference and a fin-

like hand. His legs were deformed in the same manner as his arm, and a defective hip caused such lameness that Merrick could walk only with the aid of a stick. The disorder from which Merrick suffered was long thought to be an extremely severe case of neurofibromatosis, but his deformities were probably the result of an extremely rare disease known as Proteus syndrome.

Merrick was confined to a workhouse at age 17, then escaped four years later to join a freak show (1883). While on exhibition, he was discovered by a London physician, Frederick Treves, and admitted to London Hospital (1886). He remained there until, at age 27, he died in his sleep of accidental suffocation.

A play about Merrick, *The Elephant Man*, by Bernard Pomerance, appeared in 1979; an unrelated motion picture based on Merrick's life was released in 1980.

Elephant Mountains (India): see Anaimalai Hills.

Elephant Mountains (Cambodia): see Dâmrei Mountains.

elephant seal, also called SEA ELEPHANT, either of the two largest pinnipeds (aquatic mammals of the suborder Pinnipedia): the northern elephant seal (species *Mirounga angustirostris*), now found mainly on coastal islands off California and Baja California; or the southern elephant seal (*M. leonina*), found throughout sub-Antarctic regions. Elephant seals are gregarious animals named for their size and for the male's inflatable, trunklike snout. They are in the family Phocidae.

The northern elephant seal is yellowish or gray-brown, and the southern is blue-gray. The southern species has an extensive molting

Elephant seal bull (*Mirounga*)
Anthony Mercieca—Root Resources

period in which considerable patches of hair and skin are shed. Males of both species attain a length of approximately 6.5 m (21 feet) and a weight of about 3,530 kg (7,780 pounds) and are much larger than the females, which grow to 3.5 m and weigh 900 kg. Elephant seals feed on fish and on squid or other cephalopods. The northern species is nonmigratory; the southern elephant seal, like the northern form, breeds and molts on land, but it winters at sea, possibly near the pack ice. During the breeding season, elephant seals become aggressive toward each other. The bulls fight to establish territories along beaches and to acquire harems of up to 40 cows. The cows produce single brownish black pups yearly. They mate about three weeks after delivery, and a three-month dormancy period ensues before the fertilized ovum implants. The total pregnancy lasts about 11 months. Both species have been hunted for their oil and in the 19th century were reduced almost to extinction; under protection, however, they have gradually increased in number and their survival is no longer threatened.

elephant shrew (order Macroscelidea), any of 15 species of rat-sized African mammals named for their long, tapered, and flexible snout (proboscis). All have slim bodies, slender limbs, and very long hind legs and feet. Although they resemble shrews, they are not insectivores but constitute an entirely different mammalian order.

Elephant shrews are terrestrial and active during the day. Their ears and eyes are large, and, when alarmed, they run along paths they

Forest elephant shrew (*Petrodromus tetradactylus*)
Russ Kinne—Photo Researchers

construct and maintain, sometimes leaping over obstacles. When foraging, they use their paws and the constantly moving snout to probe the ground for small insects, other arthropods, and earthworms.

Checked elephant shrews (genus *Rhynchocyon*) are the largest species, weighing about half a kilogram (1.1 pounds), with a body 23 to 32 cm (9 to 13 inches) long and a slightly shorter tail. They live only in East Africa, where they inhabit tropical forests. Nests are made of dry leaves on the open forest floor.

In addition to the genus *Rhynchocyon*, the family Macroscelididae includes three other genera, each with one species.

Elephanta Island, island located in Bombay Harbour of the Arabian Sea, about 5 miles (8 km) east of Bombay city and island, and 2

The Trimurti, a three-headed bust of the gods Siva, Vishnu, and Brahmā, in one of the caves on Elephanta Island

Harrison Forman

miles (3 km) west of the mainland coast of Mahārāshtra state, western India. Elephanta Island has an area of 4–6 square miles (10–16 square km), varying with the tide. Its Hindi name, Ghārāpuri, derives from a small village in the south of the island. The Portuguese name refers to a large stone elephant that was

later removed from the island and placed in Victoria Gardens (now called Jijāmāta Udyan), Bombay. Elephanta is famous for its 8th- and 9th-century cave temples. When it was ceded to the Portuguese by the kings of Ahmadābād, however, it ceased to be a place of worship, and the caves and sculptures were damaged by Portuguese soldiers. In the 1970s they were restored and preserved, and the island became a popular tourist resort. The most-celebrated of the sculptures is the Trimurti, a three-headed bust, 20 feet (6 m) high, of the gods Siva ("Destroyer"), Vishnu ("Preserver"), and Brahmā ("Creator").

elephantiasis, condition associated with the infectious diseases known collectively as filariasis (*q.v.*).

Elephantine, Arabic JAZĪRAT ASWĀN, island in the Nile opposite Aswān city in Aswān *muḥāfazāh* (governorate), Upper Egypt. Elephantine is the Greek name for pharaonic Abu. There the 18th- and 19th-dynasty pharaohs built a large temple to Khnum, the ram god of the cataract region, to his consort, Sati, and to Anuket, goddess of nearby Sehel. To the north stands the Old and Middle Kingdom shrine. Numerous outstanding rock tombs of the Old and Middle Kingdom nobles of the city are situated high in the cliff on the west bank of the Nile. In the Old Kingdom (*c.* 2575–*c.* 2130 BC) Elephantine was known as the "door of the south," since it was the most southerly city in Egypt and the starting point for Sudanese trade. In the Middle Kingdom (1938–*c.* 1600? BC) it was an administrative centre for Egyptian-controlled Nubia. During the New Kingdom (1539–1075 BC), the region was part of the province of Nubia, but, from the Saite period (664–525 BC), it again became a frontier fortress. In modern times the island is the site of two Nubian villages.

elephant's tooth, also called ELEPHANT'S TUSK (marine mollusk): *see* tusk shell.

elephantsnout fish, any of certain mormyrid (*q.v.*) species.

EleTs (Russia): *see* Yelets.

Eleusinia, ancient Greek festival in honour of Demeter (the goddess of agriculture), unconnected with the Eleusinian Mysteries despite the similarity of names. The Eleusinia, which included games and contests, was held every two years, probably in the month of Metageitnion (August–September). Every second festival had a particularly elaborate observance and was known as the Great Eleusinia. Its purpose was thanksgiving and sacrifice to Demeter for the gift of grain.

Eleusinian Mysteries, most famous of the secret religious rites of ancient Greece. According to the myth told in the Homeric *Hymn to Demeter*, the earth goddess Demeter (*q.v.*) went to Eleusis in search of her daughter Kore (Persephone), who had been abducted by Hades (Pluto), god of the underworld. Befriended by the royal family of Eleusis, she agreed to rear the queen's son. She was, however, prevented by the queen's fear from making the boy immortal and eternally young. After this occasion, she revealed her identity to the royal family and commanded that a temple be built for her into which she retired.

According to the *Hymn to Demeter*, the Mysteries at Eleusis originated in the two-fold story of Demeter's life—her separation from and reunion with her daughter and her failure to make the queen's son immortal. After Eleusis was incorporated, the city of Athens took responsibility for the festival, but the festival never lost its local associations.

The Mysteries began with the march of the *mystai* (initiates) in solemn procession from Athens to Eleusis. The rites that they then performed in the Telesterion, or Hall of Initiation, were and remain a secret. Something was

recited, something was revealed, and acts were performed, but there is no sure evidence of what the rites actually were, though some garbled information was given by later, Christian writers who tried to condemn the Mysteries as pagan abominations. It is clear, however, that neophytes were initiated in stages and that the annual process began with purification rites at what were called the Lesser Mysteries held at Agrai (Agrae) on the stream of Ilissos, outside of Athens, in the month of Anthesterion (February–March). The Greater Mysteries at Eleusis was celebrated annually in the month of Boedromion (September–October). It included a ritual bath in the sea, three days of fasting, and completion of the still-mysterious central rite. These acts completed the initiation, and the initiate was promised benefits of some kind in the afterlife.

Eleusis, ancient Greek city famous as the site of the Eleusinian Mysteries. Situated in the fertile plain of Thria about 14 miles (23 km) west of Athens, opposite the island of Salamis, Eleusis was independent until the 7th century BC, when Athens annexed the city and made the Eleusinian Mysteries a major Athenian religious festival. After the Peloponnesian War, when the Thirty Tyrants were expelled from Athens and briefly occupied Eleusis, the city was again independent (403), but Athenian hegemony was restored within two years. The Gothic leader Alaric destroyed Eleusis in AD 395, and the site remained deserted until the 18th century, when it was revived as the modern town of Eleusis (Greek Lepsina), now an industrial suburb of Athens.

The Greek Archaeological Society, excavating the site after 1882, laid bare the whole of the sacred precinct, which included the Great Propylaea, a 2nd-century-AD copy of the central building of the Propylaea on the Acropolis of Athens. It also traced its extensions at various periods and revealed successive stages in the structure of the Telesterion, or Hall of Initiation, first built in late Mycenaean times, before 1000 BC.

Eleutherius, SAINT (b. Nicopolis, Epirus, Roman Empire [now in Greece]—d. May 24, 189, Rome; feast day May 26), pope from about 175 to 189. During his pontificate the church was involved in a controversy over Montanism, a movement that arose in Asia Minor among Christians who believed that new spiritual revelations could be achieved through the ecstatic trances of their prophets.

The early Christian writer St. Hecgesippus says that Eleutherius was deacon of the Roman church under Pope St. Anicetus (*c.* 155–*c.* 166). He was pope in the reign of Commodus (Roman emperor 180–192 and coruler with his father, Marcus Aurclius, 176–180), who was relatively tolerant of the Christians. Eleutherius had been devoting close attention to the Montanist controversy when, in 177, Christians in the Lyon area wrote him expressing their opinion of the teachings of the prophet Montanus. Although the letter has been lost, it is believed to have asked Eleutherius to show mercy but not to compromise with followers of the movement. The churches of Lyon and Vienne, Fr., sent the letter by Bishop St. Irenaeus of Lyon, who was delegated to advise Eleutherius.

The opposition of Eleutherius to the Montanist movement has been noted, but the nature of his mediation in the dispute is not known. Modern historians agree in rejecting the legend that a king of Britain named Lucius wrote Eleutherius asking the pope to send missionaries.

elevator, also called LIFT, car that moves in a vertical shaft to carry passengers or freight between the levels of a multistory building.

Most modern elevators are propelled by electric motors, with the aid of a counterweight, through a system of cables and sheaves (pulleys). By opening the way to higher buildings, the elevator played a decisive role in creating the characteristic urban geography of many modern cities, especially in the United States, and promises to fill an indispensable role in future city development.

The practice of lifting loads by mechanical means during building operations goes back at least to Roman times; the Roman architect-engineer Vitruvius in the 1st century BC described lifting platforms that used pulleys and capstans, or windlasses, operated by human, animal, or water power. Steam power was applied to such devices in England by 1800. In the early 19th century a hydraulic lift was introduced, in which the platform was attached to a plunger in a cylinder sunk in the ground below the shaft to a depth equal to the shaft's height. Pressure was applied to the

fluid in the cylinder by a steam pump. Later a combination of sheaves was used to multiply the car's motion and reduce the depth of the plunger. All these devices employed counterweights to balance the weight of the car, requiring only enough power to raise the load.

Prior to the mid-1850s, these principles were primarily applied to freight hoists. The poor reliability of the ropes (generally hemp) used at that time made such lifting platforms unsatisfactory for passenger use. When an American, Elisha Graves Otis, introduced a safety device in 1853, he made the passenger elevator possible. Otis' device, demonstrated at the Crystal Palace Exposition in New York, incorporated a clamping arrangement that gripped the guide rails on which the car moved when tension was released from the hoist rope. The first passenger elevator was put into service in the Haightwout Department Store in New York City in 1857; driven by steam power, it climbed five stories in less than a minute and was a pronounced success.

Improved versions of the steam-driven elevator appeared in the next three decades, but no significant advance took place until the introduction of the electric motor for elevator operation in the mid-1880s and the first commercial installation of an electric passenger elevator in 1889. This installation, in the Demarest Building in New York City, utilized an electric motor to drive a winding drum in the building's basement. The introduction of electricity led to two further advances: in 1894 push-button controls were introduced, and in 1895 a hoisting apparatus was demonstrated in England that applied the power to the sheave (pulley) at the top of the shaft; the weights of the car and counterweight sufficed to guarantee traction. By removing the limitations imposed by the winding drum, the traction-drive mechanism made possible taller shafts and greater speeds. In 1904 a "gearless" feature was added by attaching the drive sheave directly to the armature of the electric motor, making speed virtually unlimited.

With the safety, speed, and height problems overcome, attention was turned to convenience and economy. In 1915 so-called automatic levelling was introduced in the form of automatic controls at each floor that took over when the operator shut off his manual control within a certain distance from the floor level and guided the car to a precisely positioned stop. Power control of doors was added. With increased building heights, elevator speeds increased to 1,200 feet (365 metres) per minute in such express installations as those for the upper levels of the Empire State Building (1931) and reached 1,800 feet (549 metres) per minute in the John Hancock Center, Chicago, in 1970.

Automatic operation, widely popular in hospitals and apartment buildings because of its economy, was improved by the introduction of collective operation, by which an elevator or group of elevators answered calls in sequence from top to bottom or vice versa. The basic safety feature of all elevator installations was the hoistway door interlock that required the outer (shaft) door to be closed and locked before the car could move. By 1950 automatic group-supervisory systems were in service, eliminating the need for elevator operators and starters.

An early attempt to minimize the sacrifice of floor space in elevator installations in tall buildings was the basis of the idea of the double-deck elevator, first tried in 1932. Each elevator consisted of two cars, one mounted above the other and operating as a unit, serving two floors at each stop. The technique is being increasingly adopted. Automatic double-deck elevators in the Time-Life Building, Chicago, were operating in 1971, and installations in the John Hancock Tower, Boston; the Standard Oil Company (Indiana) building, Chicago; and the Canadian Imperial Bank of

Commerce, Toronto, were under construction in 1971.

Modern elevators are made in a variety of types for many purposes; in addition to ordinary freight and passenger operations they are used in ships, dams, and such specialized structures as rocket launchers. Heavy-lift, rapid-descent elevators are employed in high-rise construction operations. Practically all are electrically propelled, either by cables, sheave and counterweight, by a winding-drum mechanism (still used in many low-rise freight elevators), or by an electro-hydraulic combination. Multiple cables (three or more) increase both the traction surface with the sheave and the safety factor; cable failure is rare.

The drive motor usually operates on alternating current for slower speeds and direct current for higher speeds. With the direct-current motor, the speed is changed by varying the field strength of a direct-current generator, and by adjusting the direct connection of the armature of the generator with the armature of the drive motor. For high-speed elevators, a gearless arrangement is used, usually with the cables wrapped twice around the sheave. The traction elevator may have an unlimited rise, however, rises exceeding 100 feet require compensating ropes—*i.e.*, ropes from the bottom of the car to the bottom of the counterweight; as the car rises, the compensating rope weight is transferred to the car, and as it descends, more is transferred to the counterweight, keeping the load on the drive machine nearly constant (see illustration).

Hydraulic cylinders and plungers are used for low-rise passenger elevators and for heavy duty freight elevators. The plunger pushes the platform from below by the action of pressurized oil in the cylinder. A high-speed electric pump develops the pressure needed to raise the elevator; the car is lowered by the action of electrically operated valves which release the oil into a storage tank. Specialized types of hydraulic cylinder and plunger arrangements, including horizontally placed elements, are used for unusual applications. For instance, the roped, or "geared," type of hydraulic elevator common around 1900, with plunger and cylinder fitted with sheaves at each end, is employed on aircraft-carrier elevators to lift heavy loads short distances. As pressure is applied to the plunger, the distance between the sheaves increases, and the ropes wrapped around the sheaves pull up the elevator.

Elevators lifted by hoisting ropes are required to have platform "safeties," devices designed to clamp onto the steel guide rails upon activation, quickly braking the elevator to a halt. The safety, usually mounted below the car platform, is actuated by a speed governor through a rope. The rope pulls the safety to the on position in the event of excessive downward motion of the car. The device first cuts off elevator power; if excessive speed continues, it applies the safety brake.

Most modern elevators are automatic, using various control systems to operate elevators individually or in groups. The earliest automatic control system, single-automatic-push-button, gives a rider exclusive use of the car for a trip. It is used in small apartment buildings and for freight elevators.

Collective operation is popular for use with a single elevator in a building. The car answers all calls in one direction in sequence and then reverses and answers all calls in the opposite direction. It is used in larger apartments, hospitals, and small office buildings. A variation, called two-car or duplex collective, permits two cars to operate together and share calls between them.

Group-automatic operation controls two or more cars as a group, keeping them timed to operate within a specified operating interval. Group-automatic operation is used if traffic is heavy and two or more elevators are operating as in hospitals, department stores, and offices.

Electric passenger elevator for automatic service

By courtesy of Otis Elevator Co

Separate outer doors and car doors are essential parts of modern elevator systems. The two usually employ the same type of operation—e.g., centre-opening, two-leaf, single-slide. Doors are opened and closed by an electric motor on the car. Door speed in closing is regulated to avoid injury to persons caught in the closure. A sensor electrically reverses the door if it strikes an object in closing. Photoelectric controls and electronic proximity devices are also employed to control door reversal. Hoistway doors are designed so that they are always closed before the elevator can operate.

For freight elevators, vertically sliding, bi-parting doors are common. Such doors consist of an upper and lower leaf, mechanically linked so that the bottom half drops to floor level while the top half rises above the cab roof. A protective inner gate is often required.

In isolated locations, especially in private residences, a telephone to an outside exchange is often required by law. In many buildings, elevators have intercommunication systems in case of mechanical failures. Alarm buttons, emergency lighting, and emergency power are often provided.

Automatic loading and unloading devices have been incorporated into modern freight elevators. A call button activates the automatic pickup; the elevator arrives, the load is pulled into the car, the car moves to the proper floor, and the load is discharged.

eleven-plus, in England, competitive examination given between primary and secondary school at about age 11. It evolved after 1944 as a means of determining in which of the three types of secondary school—grammar, technical, or modern—a child should continue his education. Originally the eleven-plus excluded unsuccessful contenders from grammar school, which would prepare them for university entrance. After the emergence in some areas of unselective comprehensive schools during the 1950s and '60s, the importance of the eleven-plus in determining who could eventually enter universities declined. Provision was also made for pupils to transfer from secondary modern to grammar schools at the age of 13, if their progress merited such a change, or to take a further two-year course in preparation for the university matriculation examinations.

The eleven-plus has been sharply criticized for determining at age 11 a child's scholastic future, a decisive factor in his vocational prospects. It also has been charged with replacing the social barrier of fee paying with one that tends to create an educational elite. Others counter, however, that the practice of streaming in the comprehensive schools has a similar elitist tendency. The most damaging criticism of the eleven-plus emerged after surveys were conducted that demonstrated that it was inefficient and placed a large proportion of students in the wrong type of school.

elf, plural **ELVES**, in Germanic folklore, originally, a spirit of any kind, later specialized into a diminutive creature, usually in tiny human form. In the *Prose*, or *Younger Edda*, elves were classified as light elves (who were fair) and dark elves (who were darker than pitch); these classifications are roughly equivalent to the Scottish seelie court and unseelie court. The notable characteristics of elves were mischief and volatility. They were believed at various times and in various regions to cause diseases in humans and cattle, to sit upon the breast of a sleeper and give him bad dreams (the German word for nightmare is *Alpdrücken*, or "elf-pressure"), and to steal human children and substitute changelings (deformed or weak elf or fairy children). In the British Isles, flint implements called elf-bolts, elf-arrows, or elf-shot (which are now known to be prehistoric tools used by the aboriginal Irish and the early Scots) were believed to be the weapons with

which elves injured cattle. Elves occasionally also were benevolent and helpful. The second edition of *Encyclopædia Britannica*, which was published in 1777–84, calls the word elf obsolete but reports that belief in such creatures "still subsists in many parts of our own country. . . In the Highlands of Scotland, newborn children are watched till the christening is over, lest they should be stolen or changed by some of these phantastical existences." In time, elves came to be indistinct from fairies, though both older classics—such as Johann Wolfgang von Goethe's poem "Der Erbkönig" ("The Elf King")—and such modern classics

as J.R.R. Tolkien's *Lord of the Rings* (1954–55) still treat elves as a distinct type.

Elf Aquitaine, in full SOCIÉTÉ NATIONALE ELF AQUITAINE (French: "Elf Aquitaine National Society"), French corporate group formed on Sept. 1, 1976, in the reorganization and consolidation of petrochemical, mining, and several other industries. Until 1994, a French-government company, the *Entreprise de Recherches et d'Activités Pétrolières* (ERAP; "Enterprise for Petroleum Search and Activity"), held a majority interest in Elf Aquitaine. That year the government privatized the oil company, selling off its majority shares. Headquarters are in Paris.

Ever since enactment of its oil law of 1928, France had exercised a considerably greater degree of state supervision over its oil companies than have other countries in western Europe. Government agencies issued licenses and regulations for extraction and refining in France and Algeria and, later, in other countries, controlling not only small concerns but also such giants as the *Société Nationale des Pétroles d'Aquitaine* (SNPA), which was formed in 1941. On Jan. 1, 1966, two major government regulatory agencies were merged to form ERAP, which became a state holding company for all previously created French oil companies, including SNPA.

The Elf Aquitaine group engages not only in the development, marketing, and shipping of petrochemicals (those made from natural gas and crude oil) but also in the mining of such ores as nickel and coal in France, North America, Africa, and Australia. It also has diversified into such industrial activities as pharmaceuticals, cosmetics, health care, plastics, geothermal and solar energy, and data processing. The group obtained a major interest in the U.S. mining industry through a merger with Texasgulf Inc. in 1981.

elf owl (*Micrathene whitneyi*), tiny bird of prey of the family Strigidae (order Strigiformes) of

Painting by Albert E. Gilbert

Mexico and the southwestern United States. It is the smallest owl and is about the size of a sparrow. In the cactus deserts, elf owls are among the most common birds, but they also inhabit forested areas, dry grasslands, and wet savanna. They nest in holes in cacti or trees and hunt insects at night. Elf owls have round heads, which are large in proportion to the body, and big yellow eyes.

elfin-gold (plant): see luminous moss.

elfin woodland, stunted forest at high elevations in warm, moist areas. Its low, gnarled trees are heavily draped with air plants, and its floor is cushioned by mosses and other primitive plants. Elfinwood, or Krummholz, is a similar stunted forest characteristic of most Alpine regions. See also cloud forest.

Elgar, Sir Edward, in full SIR EDWARD WILLIAM ELGAR (b. June 2, 1857, Broadhatch, Worcestershire, Eng.—d. Feb. 23, 1934, Worcester, Worcestershire), English composer whose works in the orchestral idiom of late 19th-century Romanticism—characterized by bold tunes, striking colour effects, and mastery of large forms—stimulated a renaissance of English music.

The son of an organist and music dealer, Elgar left school at age 15 and worked briefly in a lawyer's office. He was an excellent violinist, played the bassoon, and spent periods as a bandmaster and church organist. He had no formal training in composition. After working in London (1889–91), he went to Malvern, Worcestershire, and began to establish a rep-

Elgar
EB Inc

utation as a composer. He produced several large choral works, notably the oratorio *Lux Christi* (1896; *The Light of Life*), before composing in 1896 the popular *Enigma Variations* for orchestra. The variations are based on the counter-melody to an unheard theme: a well-known tune Elgar would not identify—hence the enigma. Attempts to discover it have been unsuccessful. All but the last of the 14 variations refer cryptically to friends of Elgar, the exception being his own musical self-portrait. This work, highly esteemed by Hans Richter, who conducted the first performance in 1899,

Cathedral of Moray at Elgin, Moray

A.F. Kersting

brought Elgar recognition as a leading composer and became his most frequently performed work. In 1900 there followed another major work, the oratorio *The Dream of Gerontius*, which many consider his masterpiece. Based on a poem by John Henry Cardinal Newman, it dispensed with the traditional admixture of recitatives, arias, and choruses, using instead a continuous musical texture as in the musical dramas of Wagner.

Elgar, a Roman Catholic, planned to continue with a trilogy of religious oratorios, but he completed only two: *The Apostles* (1903) and *The Kingdom* (1906). In these less successful works, representative themes are interwoven in the manner of the leitmotifs of Wagner. Other vocal works include the choral cantata, *Caractacus* (1898), and the song cycle for contralto, *Sea Pictures* (1900).

In 1904 Elgar was knighted, and from 1905 to 1908 he was the University of Birmingham's first professor of music. During World War I he wrote occasional patriotic pieces. After the death of his wife in 1920, he curtailed his music writing severely, and in 1929 he returned to Worcestershire. Friendship with Bernard Shaw eventually stimulated Elgar to further composition, and at his death he left unfinished a third symphony, a piano concerto, and an opera.

Elgar's principal works of a programmatic nature are the overture *Cockaigne*, or *In London Town* (1901), and the "symphonic study" *Falstaff* (1913). Of his five *Pomp and Circumstance* marches (1901–07; 1930), the first became particularly famous. Also highly esteemed are his two symphonies (1908 and 1911), the *Introduction and Allegro* for strings (1905), and his *Violin Concerto* (1910) and *Cello Concerto* (1919).

The first English composer of international stature since Henry Purcell (1659–95), Elgar liberated his country's music from its insularity. He left to younger composers the rich harmonic resources of late Romanticism and stimulated the subsequent national school of English music. His own idiom was cosmopolitan, yet his interest in the oratorio is grounded in the English musical tradition. Especially in England, Elgar is esteemed both for his own music and for his role in heralding the 20th-century English musical renaissance.

Elgin, royal burgh (town) and city, in Moray council area and historic county, northeastern Scotland, situated on the River Lossie in the fertile plain of Moray.

On a hill to the west stood the 12th-century castle that in 1291 marked the northern limit of the English occupation of Scotland. The castle was destroyed after the Battle of Bannockburn (1314), which restored Scottish independence. The once-splendid cathedral of Moray, now a ruin, was founded in 1224, and Elgin gained royal burgh status in 1234. Twice destroyed by fire during the Middle Ages, the cathedral was rebuilt in the form of a Jerusalem cross on a scale that made it one of the finest churches in Scotland. The 18th cen-

tury, when the cathedral finally fell into ruin, was the great period of Scottish town architecture, and much of the High Street was lined with fine stone houses.

Elgin now serves as an educational and market centre for a wide area. Its industries include whisky distilling and wool milling. The internationally famous Gordonstoun School, an independent boarding school founded in 1934 by the German educator Kurt Hahn, lies 6 miles (10 km) to the north. Elgin is the historic county town (seat) and administrative centre of Moray. Pop. (1991) 19,027.

Elgin, city, Kane and Cook counties, north-eastern Illinois, U.S., on the Fox River, about 40 miles (65 km) northwest of Chicago. Elgin was founded in 1835 by James Talcott Gifford, a settler from New York, and named for a Scottish hymn. In 1838 a dam was built on the river, and soon several mills were in operation. The railroad arrived in 1850, and Elgin quickly became a major dairy-producing centre; by the 1920s, however, the industry had declined dramatically. In 1865 the Elgin Milk Condensing Company was opened by Gail Borden; it closed in 1918. From 1864 to 1969 the city was the home of the Elgin National Watch Company. Casino gambling, financial services, and health care are important to Elgin's modern economy. Manufactures include electronic equipment, industrial bearings, plastics, commercial cooking equipment, and sealing devices. Elgin Academy was established in 1839, Judson College (Baptist) in 1963, and Elgin Community College in 1949. Inc. town, 1846; city, 1854. Pop. (2000) 94,487.

Elgin, EARLS OF, titled Scottish nobility in the family Bruce, grouped below chronologically and indicated by the symbol ●.

● **Elgin, Thomas Bruce, 7th earl of, 11TH EARL OF KINCARDINE** (b. July 20, 1766—d. Nov. 14, 1841, Paris), British diplomatist and art collector, famous for his acquisition of the Greek sculptures now known as the "Elgin Marbles" (*q.v.*).

Third son of Charles Bruce, the 5th earl (1732–71), he succeeded his brother William Robert, the 6th earl, in 1771 at the age of five. Entering the army in 1785 and rising later to the rank of major general, Elgin began his

diplomatic career in 1790. Envoy at Brussels in 1792 and at Berlin in 1795 during the first phase of the war against revolutionary France, he was appointed envoy extraordinary at Constantinople in 1799, retaining the post until 1803. Detained in France on his way home through the rupture of the Treaty of Amiens, Elgin did not reach England until 1806 and found his reputation under heavy attack. Though serving as a Scottish representative peer between 1790 and 1840, he took little further part in public life.

Keenly interested in classical art, Elgin secured permission from the Turks after his arrival in Constantinople to record and remove Greek antiquities, fearing their destruction in the ongoing conflict between the Greeks and the Turks. Between 1802 and 1812 his great collection of sculptures, taken chiefly from the Parthenon at Athens, then under Turkish domination, was brought to England. In the violent controversy generated by the removal, Elgin was denounced as a dishonest and rapacious vandal, notably by the poet Lord Byron, while the quality of his acquisitions, later regarded as exceptional, was questioned. In 1810 he published a *Memorandum* defending his actions and judgment. On the recommendation of a parliamentary committee, which also vindicated Elgin's conduct, the "Marbles" were bought by Great Britain in 1816 for £35,000, considerably below their cost to Elgin, and deposited in the British Museum, where they remain on view.

● **Elgin, James Bruce, 8th earl of, 12TH EARL OF KINCARDINE** (b. July 20, 1811, London—d. Nov. 20, 1863, Dharmasala, India), British statesman and governor-general of British North America in 1847–54 who effected responsible, or cabinet, government in Canada and whose conduct in office defined the role for his successors.

Bruce was elected to the British House of Commons for Southampton as a liberal Tory in 1841, but later that year he inherited his father's title (Scottish peerage) and left the Commons. In 1842 he was appointed governor of Jamaica. In 1846 he was named governor-general of British North America and given the task of implementing the policy of responsible government recommended by his father-in-law, John George Lambton, 1st earl of Durham. He worked with the existing administration of the union of Canada East and Canada West until its defeat in the 1848 general election, when he supported the next administration's Rebellion Losses Act (1849), which compensated all Canadians for losses incurred during an 1837 rebellion in Lower Canada. His stand attracted strong Tory opposition; Elgin himself was stoned (though uninjured) by a mob, and Parliament buildings in Montreal were burned.

Elgin maintained good relations with the two subsequent administrations. In 1849 he was created Baron Elgin (United Kingdom peerage) and was made a privy councillor. He negotiated the Reciprocity Treaty (1854) between the Canadian colonies and the U.S. He also worked on the Canadian educational system and abolished seigneurial tenure. In 1857–59 and 1860–61 he served as special commissioner to China, and in 1858 he made an official visit to Japan. In England he served as postmaster general (1859–60) in Lord Palmerston's cabinet, before undertaking his last post as viceroy of India in 1862.

● **Elgin, Victor Alexander Bruce, 9th earl of** (b. May 16, 1849, near Montreal—d. Jan. 18, 1917, Dunfermline, Fife, Scot.), British viceroy of India from 1894 to 1899.

He was the son of the 8th earl and was educated at Eton and at Balliol College, Oxford. In politics a Liberal of right-wing tendencies, Elgin was first commissioner of works under William Gladstone in 1886. Emulating his fa-

ther, whom he succeeded in 1863, he became viceroy of India in 1894. His viceroyalty was a period of economic stringency and Indian unrest, further complicated by frontier wars. Upon relinquishing his appointment and returning to England in 1899, Elgin was made Knight of the Garter. During 1902–03 he acted as chairman of the royal commission that investigated the conduct of the South African War. From 1905 until 1908, when he retired from public life, Elgin served as secretary of state for the colonies in Sir Henry Campbell-Bannerman's administration.

Modest and retiring, disliking the requisite pomp, Elgin was not regarded as a successful or effective viceroy of India. His tenure of the colonial office saw the generous and much-praised settlement with the Boers in South Africa. This was, however, primarily the work of the prime minister, Sir Henry Campbell-Bannerman; and Elgin had little sympathy for his colleagues' more radical innovations in imperial government, being particularly opposed to proposals for Indian reform.

Elgin Marbles, collection of ancient Greek sculptures and architectural details in the British Museum, London. The objects were removed from the Parthenon at Athens and from other ancient buildings and shipped to England by arrangement of Thomas Bruce, 7th Lord Elgin, who was British ambassador to the Ottoman Empire (1799–1803). The removal created a storm of controversy in England that led to an investigation by Parliament. The controversy continued into the late 20th century.

Elgin was a lover of art and antiquities. By his own account, he was concerned about damage being done to important artworks in the temples of Greece, then under Ottoman sway. Fearing that they would eventually be destroyed because of Turkish indifference, he asked permission of the Sublime Porte to have artists measure, sketch, and copy important pieces of sculpture and architectural detail for posterity. At length the request was granted—along with the authority “to take away any pieces of stone with old inscriptions or figures thereon.”

Elgin then began selecting a vast store of the treasures for shipment to England. Among these were friezes, pediment sculptures, and fragmented statues from the cella (interior chamber) walls of the Parthenon; the northeast column, an anta capital, blocks of wall crown including architrave and cornice, and a caryatid from the Erechtheum (a temple of Athena); and various other antiquities from Athens, Attica, and other sites.

A series of shipments took the treasures to England in 1802–12 with but one mishap—HMS *Mentor* sank in a storm off the Greek

isle of Cythera in 1804, but the entire cargo was recovered. Elgin left the embassy in 1803 and arrived in England in 1806. The collection remained private for the next 10 years.

An outcry arose over the affair, and Elgin was assailed for rapacity, vandalism, and dishonesty in hauling the Grecian treasures to London. Lord Byron and many others attacked Elgin's actions in print. A select committee of Parliament was established to examine the sculpture and the possibility of acquiring it for the nation. In 1810 Elgin published a defense of his actions that silenced most of his detractors. The final shipment of the Elgin Marbles reached London in 1812, and in 1816 the entire collection was acquired from Elgin by the crown for the sum of £35,000.

The Greek government has frequently demanded the return of the marbles, but the British Museum—claiming among other reasons that it has saved the marbles from certain damage and deterioration—has not acceded, and the issue remains controversial.

Elgon, Mount, extinct volcano on the Kenya-Uganda boundary. Its crater, about 5 miles (8 km) in diameter, contains several peaks, of which Wagagai (14,176 feet [4,321 m]) is the highest. Its extrusions cover about 1,250 square miles (3,200 square km) and consist largely of fragmental rocks and only a smattering of lavas. The mountain slope is gentle and the outline unimpressive. On the east and southeast at about 6,200 feet (1,890 m) its relief merges with the Usasin Gishu Plateau, but in the west and northwest spectacular cliffs dominate the 3,600-foot (1,100-metre) plains of eastern Uganda. In the summit zone, moraines provide ample evidence of former glaciation. On the caldera's uneven floor there are considerable swamps, tapped by the Suam and Turkwel rivers. Other streams furrow the slopes. The moorland zone, containing tree heaths, giant groundsel, and lobelias, extends down to 10,000 feet (3,050 m), where it is succeeded by bamboo forest. Below 8,300 feet (2,550 m) is a temperate deciduous forest.

The Bantu-speaking Gishu (Gisu), cultivators of coffee, bananas, millet, and corn (maize), occupy the western slopes. Elgonyi was the Masai name for the mountain. The Scottish explorer Joseph Thomson visited the southern side of Elgon in 1883; in 1890 Frederick (later Sir Frederick) Jackson and Ernst Gedgc traversed the caldera from north to south.

Elhuyar (y de Suvisa), Fausto (d') (b. Oct. 11, 1755, Logroño, Spain—d. Feb. 6, 1833, Madrid), Spanish chemist and mineralogist who in partnership with his brother Juan José was the first to isolate tungsten, or wolfram (1783), though not the first to recognize its elemental nature. After teaching at Vergara, in Spain (1781–85), Fausto accompanied his brother to several European colleges, including the Freiberg (Saxony) School of Mining and the University of Uppsala in Sweden. In 1788 he was appointed supervisor of the Mexican mining industry; his work was ended by the revolutionary movement early in the 19th century. On his return to Spain he was named director general of mines and minister of state. He wrote several volumes on mineralogy and coining.

Eliade, Mircea (b. March 9, 1907, Bucharest, Rom.—d. April 22, 1986, Chicago, Ill., U.S.), historian of religions and man of letters, distinguished for his researches in the symbolic language used by various religious traditions and for his attempt to reduce their meaning to underlying primordial myths that provide the basis for mystical phenomena.

Eliade took an M.A. in philosophy from the University of Bucharest in 1928. He studied Sanskrit and Indian philosophy at the University of Calcutta (1928–31) and then lived for six months in the ashram (hermitage) of Rishikesh, Himalaya. Returning to Romania,

he earned his Ph.D. in 1933 with the dissertation *Yoga: Essai sur les origines de la mystique indienne* (“Yoga: Essay on the Origins of Indian Mysticism”) and was named assistant professor at Bucharest, where he taught the history of religions and Indian philosophy

Eliade

By courtesy of the University of Chicago

(1933–39). In 1945 he went to Paris as a visiting professor at the Ecole des Hautes Études of the Sorbonne. In 1956 he became professor of the history of religions at the University of Chicago, where he remained. In 1961 he founded the journal *History of Religions*.

Fundamentally, Eliade considered religious experience in traditional and contemporary societies as credible phenomena that he termed hierophanies (i.e., manifestations of the sacred in the world). His researches traced the forms that these hierophanies have taken throughout the world and through time. Eliade's essential interpretation of traditional religious cultures and his analysis of the forms of mystical experience characterize his major works: *Traité d'histoire des religions* (1949; *Patterns of Comparative Religion*), *Le Mythe de l'éternel retour* (1949; *The Myth of the Eternal Return*), and *Le Chamanisme et les techniques archaïques de l'extase* (1951; *Shamanism: Archaic Techniques of Ecstasy*). He also expressed his views in works of fiction, notably the novels *Forêt interdite* (1955; *The Forbidden Forest*) and *The Old Man and the Bureaucrats* (1979). Among his later works are two collections of essays, *The Quest: History and Meaning in Religion* (1969) and *Occultism, Witchcraft, and Cultural Fashion: Essays in Comparative Religion* (1976). He also wrote a three-volume work entitled *A History of Religious Ideas* (1978–85) and was editor-in-chief of the 16-volume *Encyclopedia of Religion* (1987).

Elias, also spelled ELIA (Hebrew prophet): see Elijah.

Elias of Cortona (b. c. 1180, near Assisi, Duchy of Spoleto [Italy]—d. April 22, 1253, Cortona, Duchy of Tuscany [Italy]), disciple of St. Francis of Assisi and a leading figure in the early history of the Franciscan Order, which he twice governed.

In 1217 Elias headed the new Franciscan mission to the Holy Land as first minister provincial of Syria. He visited holy places in Palestine with Francis, returning with him to Italy in 1220. Vicar of the Franciscans from 1221, he governed the order from Francis' death (1226) until 1227, when John Parenti was elected in his stead. Later Elias was commissioned by Pope Gregory IX to build the Basilica of Assisi as a memorial to St. Francis.

Elected general of the order in 1232, Elias met with opposition from those who wanted strict observance of Francis' rule of poverty; they thought Elias too worldly and too dictatorial. He was deposed in 1239 and withdrew ultimately to Cortona with a few followers. Supporting the antipapal policy of Frederick II, Holy Roman emperor, he was excommu-

nicated in 1240 by Gregory and again in 1244 by Pope Innocent IV when Frederick made him ambassador to Nicaea and Constantinople. In 1245 he built a church and cloister at Cortona in honour of St. Francis. He became reconciled with the church before his death.

Eli ezer, Israel ben: see Ba'al Shem Tov.

Elijah, also spelled ELIAS, or ELIA, Hebrew ELIYAHU (fl. 9th century BC), Hebrew prophet who ranks with Moses in saving the religion of Yahweh from being corrupted by the nature worship of Baal. Elijah's name means "Yahweh is my God" and is spelled Elias in some versions of the Bible. The story of his prophetic career in the northern kingdom of Israel during the reigns of Kings Ahab and Ahaziah is told in 1 Kings 17-19 and 2 Kings 1-2 in the Old Testament. Elijah claimed that there was no reality except the God of Israel, stressing monotheism to the people with possibly unprecedented emphasis. He is commemorated by Christians on July 20 and is recognized as a prophet by Islām.

Historical setting. The Israelite king Omri had allied himself with the Phoenician cities of the coast, and his son Ahab was married to Jezebel, daughter of Ethbaal, king of Tyre and Sidon. Jezebel, with her Tyrian courtiers and a large contingent of pagan priests and prophets, propagated her native religion in a sanctuary built for Baal in the royal city of Samaria. This meant that the Israelites accepted Baal as well as Yahweh, putting Yahweh on a par with a nature-god whose supreme manifestations were the elements and biological fertility, celebrated often in an orgiastic cult. Jezebel's policies intensified the gradual contamination of the religion of Yahweh by the Canaanite religion of Baal, a process made easier by the sapping of the Israelites' faith in Yahweh.

Story. Elijah was from Tishbe in Gilead. The narrative in 1 Kings relates how he suddenly appears during Ahab's reign to proclaim a drought in punishment of the cult of Baal that Jezebel was promoting in Israel at Yahweh's expense. Later Elijah meets 450 prophets of Baal in a contest of strength on Mount Carmel to determine which deity is the true God of Israel. Sacrifices are placed on an altar to Baal and one to Yahweh. The pagan prophets' ecstatic appeals to Baal to kindle the wood on his altar are unsuccessful, but Elijah's prayers to Yahweh are answered by a fire on his altar. This outcome is taken as decisive by the Israelites, who slay the priests and prophets of Baal under Elijah's direction. The drought thereupon ends with the falling of rain.

Elijah flees the wrath of the vengeful Jezebel by undertaking a pilgrimage to Mount Horeb (Sinai), where he is at first disheartened in his struggle and then miraculously renewed. In a further narrative, King Ahab has a man named Naboth condemned to death in order to gain possession of his vineyard. Ahab's judicial murder of Naboth and confiscation of his vineyard arouse Elijah as the upholder of the moral law, as before he had come forward as the champion of monotheism. Elijah denounces Ahab for his crimes, asserting that all men are subject to the law of God and are therefore equals. Later Ahab's son, King Azariah, appeals to Baal to heal him of an illness, and Elijah once more upholds the exclusive rights of Yahweh by bringing down "fire from heaven." After bestowing his mantle on his successor, Elisha, the prophet Elijah is taken up to heaven in a whirlwind.

Theological significance. One of the most important moments in the history of monotheism is the climax of Elijah's struggle with Baalism. His momentous words, "If Yahweh is God, follow him, but if Baal, then follow him"—especially when taken with the prayer

"Hear me, Yahweh, that this people may know that you, Yahweh, are God"—show that more is at stake than simply allotting to divinities their particular spheres of influence. The true question is whether Yahweh or Baal is God, simply and universally. Elijah's words proclaim that there is no reality except the God of Israel, there are no other beings entitled to the name of divinity. The acclamation of the people, "Yahweh, he is God" expresses a fully conscious monotheism, never before perhaps brought home to them so clearly.

Elijah's deepest prophetic experience takes place on his pilgrimage to Horeb, where he learns that God is not in the storm, the earthquake, or the lightning. Nature, so far from being God's embodiment, is not even an adequate symbol. God is invisible and spiritual and is best known in the intellectual word of revelation, "the still, small voice." The transcendence of God receives here one of its earliest expressions. Elijah's story also expresses for the first time a thought that was to dominate Hebrew prophecy: in contrast to the bland hopes of the people, salvation is bestowed only on a "remnant," those purified by God's judgment. The theme of the later prophets, that morality must be at the heart of ritual worship, is also taught by Elijah, who upholds the unity of law and religion against the despotic cruelty of a king influenced by a pagan wife. Elijah's work may also be regarded as a protest against every effort to find religious experience in self-induced ecstasy and sensual frenzy rather than in a faith linked with reason and morality. (K.Sm./Ed.)

Elijah ben Solomon, in full ELIJAH BEN SOLOMON ZALMAN, also called by the acronym HA-GRA, from HA-GAON RABBI ELIYA-HU, also called ELIJAH GAON (b. April 23, 1720, Solec, Lithuania, Russian Empire—d. Oct. 9, 1797, Vilna [now Vilnius, Lithuania]), the gaon ("excellency") of Vilna, and the outstanding authority in Jewish religious and cultural life in 18th-century Lithuania.

Born into a long line of scholars, Elijah traveled among the Jewish communities of Poland and Germany in 1740-45 and then

Elijah ben Solomon, engraving

Picture from the photographic archive of the Jewish Theological Seminary of America, New York, Frank J. Darmstaedter

settled in Vilna, which was the cultural centre of eastern European Jewry. There he refused rabbinic office and lived as a recluse while devoting himself to study and prayer, but his reputation as a scholar had spread throughout the Jewish world by the time he was 30. As

a mark of nearly universal reverence, the title gaon, borne by the heads of the Babylonian academies and virtually extinct for many centuries, was bestowed upon him by the people.

Elijah's scholarship embraced mastery of every field of study in the Jewish literature up to his own time. His vast knowledge of the Talmud and Midrash and of biblical exegesis, as well as of mystical literature and lore, was combined with a deep interest in philosophy, grammar, mathematics and astronomy, and folk medicine.

Elijah's most important contributions were his synoptic view of Jewish learning and his critical methods of study. In an age of narrow, puritanical piety, he broadened the conception of Torah learning to include the natural sciences, and asserted that a complete understanding of Jewish law and literature necessitated the study of mathematics, astronomy, geography, botany, and zoology. He encouraged translations of works on these subjects into Hebrew. Elijah also introduced the methods of textual criticism in the study of the Bible and the Talmud. He based his interpretations on the plain meaning of the text rather than on narrow sophistries. In general, his influence was felt in the direction of an increased emphasis on rationalism and synthesis.

Elijah led an implacable opposition to the pietistic mystical movement of Hasidism from 1772 until his death. He condemned Hasidism as a superstitious and antischolastic movement and ordered the excommunication of its adherents and the burning of their books. He became the leader of the Mitnaggedim (opponents of Hasidism) and was temporarily able to check the movement's spread in Lithuania. He was also mildly opposed to the Haskala, or Jewish Enlightenment.

At about age 40 Elijah began teaching a chosen circle of devoted pupils who were already experienced scholars. Among them was Hayyim ben Issac, who went on to found the great Volozhin yeshiva (Talmudic academy), which trained several generations of scholars, rabbis, and leaders. Elijah's writings were published posthumously and include commentaries and numerous annotations on the Bible, Talmud, Midrash, and other works.

BIBLIOGRAPHY. The best accounts available in English are found in Solomon Schechter, *Studies in Judaism, First Series* (1896, reissued 1945); and Louis Ginzberg, *Students, Scholars, and Saints* (1928, reprinted 1985).

Elijah's cup, in Judaism, the fifth ceremonial cup of wine poured during the family Seder dinner on Passover (Pesah). It is left untouched in honour of Elijah, who, according to tradition, will arrive one day as an unknown guest to herald the advent of the Mes-

siah. During the Seder dinner, biblical verses are read while the door is briefly opened to welcome Elijah, who, it is further said, will resolve all controversial questions connected with the Law. In this way the Seder dinner not only commemorates the historical redemption from Egyptian bondage of the Jewish people but also calls to mind their future redemption when Elijah and the Messiah shall appear.

Elimelech of LIZHENS'K (b. 1717—d. 1787, Lzhensk, Galicia), Jewish teacher and author, one of the founders of Hasidism (a Jewish pietistic movement) in Galicia.

Elimelech was a disciple of Tov Baer, one of the early Hasidic leaders, and after Baer's death he settled in Lzhensk, which subsequently became an important Hasidic centre. Elimelech emphasized the importance of the leader (zaddik, meaning "righteous one"), who, he believed, is mediator between God and the people and possesses authority not only in the spiritual sphere but in all areas of life. Although the zaddik belongs to a higher world, he descends to the level of the community to redeem it, and his capacity to sin is a necessary part of his mission of transforming evil into good. Elimelech's ideas are set forth in his treatise *No'am Elimelekh*, which was published after his death by his son Eleazar.

elimination reaction, any of a class of organic chemical reactions in which a pair of atoms or groups of atoms are removed from a molecule, usually through the action of acids, bases, or metals and, in some cases, by heating to a high temperature. It is the principal process by which organic compounds containing only single carbon-carbon bonds (saturated compounds) are transformed to compounds containing double or triple carbon-carbon bonds (unsaturated compounds).

Elimination reactions are commonly known by the kind of atoms or groups of atoms leaving the molecule. The removal of a hydrogen atom and a halogen atom, for example, is known as dehydrohalogenation; when both leaving atoms are halogens, the reaction is known as dehalogenation. Similarly, the elimination of a water molecule, usually from an alcohol, is known as dehydration; when both leaving atoms are hydrogen atoms, the reaction is known as dehydrogenation. Elimination reactions are also classified as E1 or E2, depending on the reaction kinetics. In an E1 reaction, the reaction rate is proportional to the concentration of the substance to be transformed; in an E2 reaction, the reaction rate is proportional to the concentrations of both the substrate and the eliminating agent.

Elion, Gertrude Belle (b. Jan. 23, 1918, New York, N.Y., U.S.—d. Feb. 21, 1999, Chapel Hill, N.C.), American pharmacologist who, along with George H. Hitchings and Sir James W. Black, received the Nobel Prize for Physiology or Medicine in 1988 for their development of drugs used to treat several major diseases.

Elion graduated from Hunter College in New York City with a degree in biochemistry in 1937. Finding it difficult to obtain a research position because she was a woman, she taught chemistry in high school until joining the Burroughs Wellcome Laboratories in 1944. There she was first the assistant and then the colleague of Hitchings, with whom she worked for the next four decades.

The two scientists developed an array of new drugs that were effective against leukemia, autoimmune disorders, urinary-tract infections, gout, malaria, and viral herpes. Their success was due primarily to their innovative research methods, which marked a radical departure from the trial-and-error approach taken by previous pharmacologists. Elion and Hitchings pointedly examined the difference between the biochemistry of normal human cells and those of cancer cells, bacteria, viruses, and other pathogens (disease-causing agents). They

then used this information to formulate drugs that could kill or inhibit the reproduction of a particular pathogen, leaving the human host's normal cells undamaged. The two researchers' new emphasis on understanding basic biochemical and physiological processes enabled them to eliminate much guesswork and wasted effort typical previously in developing new therapeutic drugs.

Eliot, Sir Charles, in full SIR CHARLES NORTON EDGE'GUMBE ELIOT (b. Jan. 8, 1862, Sibford Gower, Oxfordshire, Eng.—d. March 16, 1931, at sea, in the Strait of Malacca), diplomat and colonial administrator who initiated the policy of white supremacy in the British East Africa Protectorate (now Kenya).

A scholar and linguist, Eliot served in diplomatic posts in Russia (1885), Morocco (1892), Turkey (1893), and Washington, D.C. (1899). In 1900 he was knighted and appointed commissioner and consul general for the East African Protectorate. He collaborated with the farmers there (notably Lord Delamere, to whom he ceded 100,000 acres [40,500 hectares] of land) and encouraged European immigration by the wholesale award of land concessions to European settlers.

By 1903 he was encountering opposition from the Colonial Office, which felt he was proceeding too rapidly. In 1904, after being criticized for granting a concession on land previously reserved for the Masai, he resigned his position. Following his resignation, he took no other diplomatic posts until 1920, when he became ambassador to Japan. He retired in 1926, continuing to live in Japan.

Eliot, Charles William (b. March 20, 1834, Boston, Mass., U.S.—d. Aug. 22, 1926, Northeast Harbor, Maine), American educator, leader in public affairs, president of Harvard University for 40 years, and editor of the 50-volume *Harvard Classics* (1909–10).

Eliot graduated from Harvard in 1853 and was appointed assistant professor of mathematics and chemistry there in 1858. In 1867 he sailed for Europe, where he made a study of European educational systems. His published observations (in *The Atlantic Monthly*, 1869) brought his name to the attention of the directors of Harvard, who were looking for a new president. Eliot was inaugurated in October 1869. By the time he retired in 1909 he had elevated Harvard into an institution of world renown.

Contending that higher learning in the United States needed to be "broadened, deepened, and invigorated," Eliot demanded a place for the sciences as well as the humanities in any sound program of liberal education. To counter the rigidity of the Harvard curriculum—which, following what was then general practice, was then almost totally prescribed—Eliot eliminated required courses. Under his successor, A. Lawrence Lowell, a balance was struck between required and elective courses. Eliot's influence reached into secondary education. During his presidency Harvard raised its entrance requirements, and other major colleges did likewise. This, in turn, effected a corresponding rise in secondary-school standards. In the report of a national committee

Charles William Eliot

on secondary education (1892), he urged the introduction of foreign languages and mathematics during the student's seventh school year. The idea was embodied later (1910) by the introduction of junior high schools in the United States.

Eliot's writings include *Educational Reform: Essays and Addresses 1869–1897* (1898) and *University Administration* (1908).

BIBLIOGRAPHY. Henry James, *Charles W. Eliot: President of Harvard University, 1869–1909*, 2 vol. (1930, reprinted 1973), includes a bibliography of Eliot's books, articles, and published speeches. Hugh Hawkins, *Between Harvard and America: The Educational Leadership of Charles W. Eliot* (1972), is a biography and social history.

Eliot, George, pseudonym of MARY ANN, OR MARIAN, CROSS, *née* EVANS (b. Nov. 22, 1819, Chilvers Coton, Warwickshire, Eng.—d. Dec. 22, 1880, London), English Victorian novelist who developed the method of psychological analysis characteristic of modern fiction. Her major works include *Adam Bede* (1859), *The Mill on the Floss* (1860), *Silas Marner* (1861), *Middlemarch* (1871–72), and *Daniel Deronda* (1876).

Evans was born on an estate of her father's employer. She went as a boarder to Mrs. Wallington's School at Nuneaton (1828–32), where she came under the influence of Maria Lewis, the principal governess, who inculcated

George Eliot, chalk drawing by F.W. Burton, 1865; in the National Portrait Gallery, London

a strong evangelical piety in the young girl. At her last school (1832–35), conducted by the daughters of the Baptist minister at Coventry, her religious ardour increased. She dressed severely and engaged earnestly in good works. The school gave her a reading knowledge of French and Italian, and, after her mother's death had compelled her to return home to keep house for her father, he let her have lessons in Latin and German. In 1841 she moved with her father to Coventry.

There she became acquainted with a prosperous ribbon manufacturer, Charles Bray, a self-taught freethinker who campaigned for radical causes. His brother-in-law, Charles Hennell, was the author of *An Inquiry Concerning the Origin of Christianity* (1838), a book that precipitated Evans' break with orthodoxy that had been long in preparation. Various books on the relation between the Bible and science had instilled in her keen mind the very doubts they were written to dispel. In 1842 she told her father that she could no longer go to church. The ensuing storm raged for several months before they reached a compromise, leaving her free to think what she pleased so long as she appeared respectfully at church, and she lived with him until his death in 1849.

The Brays and the Hennells quickly drew her from extreme provincialism, introducing her to many ideas in violent disagreement with her Tory father's religious and political views. When Charles Hennell married in 1843, she took over from his wife the translating of D.F. Strauss's *Das Leben Jesu kritisch bearbeitet*, which was published anonymously as *The Life of Jesus Critically Examined*, 3 vol. (1846), and had a profound influence on English rationalism. After the wedding Mrs. Hennell's father, R.H. Brabant, invited Evans to visit at Devizes. A rather silly man, he had worked for years on a book (never completed), which was to dispose of the supernatural elements in religion. They read German and Greek together and discussed theology on long walks; soon Mrs. Brabant became jealous of their intimacy, and, before the term of her visit, Evans was forced to leave. Mrs. Hennell felt that her father had acted ungenerously. Out of the humiliation of this episode George Eliot drew the horrible vividness of Mr. Casaubon in *Middlemarch*.

She spent the winter of 1849–50 at Geneva, reading extensively while living with the family of François d'Albert Durade, who painted a portrait of her. Like those by Mrs. Bray (1842) and Sir Frederic Burton (1865), all in the National Portrait Gallery, it shows her with light brown hair, gray-blue eyes, and a very fair complexion. Returning to Coventry, she spent the rest of 1850 with the Brays, pondering how to live on the £100 a year left by her father. After John Chapman, the publisher of *The Life of Jesus Critically Examined*, got her a chance to review R.W. Mackay's *The Progress of the Intellect in The Westminster Review* (January 1851), she decided to settle in London as a free-lance writer, and in January 1851 she went to board with the Chapmans at 142, Strand.

Soon after her arrival Mrs. Chapman and the children's governess, who was also Chapman's mistress, became jealous of Marian, as she now signed her name, and after 10 weeks she returned to Coventry in tears. Doubtless her feelings were strongly attracted to the magnetic Chapman, whose diary supplies this information, but there is no evidence that she was ever his mistress. A few months later he bought *The Westminster Review*, and Evans, contrite at the domestic complications she had unwittingly caused, returned to London. For three years, until 1854, she served as subeditor of *The Westminster*, which under her influence enjoyed its most brilliant run since the days of John Stuart Mill. At the Chapmans' evening parties she met many notable literary figures in an atmosphere of political and religious radicalism. Across the Strand lived the subeditor of *The Economist*, Herbert Spencer, whose *Social Statics* (1851) Chapman had just published. Evans shared many of Spencer's interests and saw so much of him that it was soon rumoured that they were engaged. Though he did not become her husband, he introduced her to the two men who did.

George Henry Lewes was the most versatile of Victorian journalists. In 1841 he had married Agnes Jervis, by whom he had four sons. In 1850 Lewes and a friend, the journalist Thornton Leigh Hunt, founded a radical weekly called *The Leader*, for which he wrote the literary and theatrical sections. In April 1850, two weeks after the first number appeared, Agnes Lewes gave birth to a son whose father was Thornton Hunt. Lewes, being a man of liberal views, had the child registered as Edmund Lewes and remained on friendly terms with his wife and Hunt. But after she bore Hunt a second child in October 1851, Lewes ceased to regard her as his wife, though, having condoned the adultery, he was precluded from suing for divorce. At this moment

of dejection, his home hopelessly broken, he met Marian Evans. They consulted about articles and went to plays and operas that Lewes reviewed for *The Leader*. Convinced that his break with Agnes was irrevocable, Evans determined to live openly with Lewes as his wife. In July 1854, after the publication of her translation of Feuerbach's *Essence of Christianity*, they went to Germany together. In all but the legal form it was a marriage, and it continued happily until Lewes' death in 1878. "Women who are content with light and easily broken ties," she told Mrs. Bray, "do not act as I have done. They obtain what they desire and are still invited to dinner."

At Weimar and Berlin she wrote some of her best essays for *The Westminster* and translated Spinoza's *Ethics* (still unpublished), while Lewes worked on his groundbreaking life of Goethe. By his pen alone he had to support his three surviving sons at school in Switzerland as well as Agnes, whom he gave £100 a year, which was continued until her death in 1902. She had four children by Hunt, the last born in 1857, all registered under Lewes' name. The few friends who knew the facts agreed that toward Agnes his conduct was more than generous, but there was a good deal of malicious gossip about the "strong-minded woman" who had "run off with" her husband. Evans' deepest regret was that her act isolated her from her family in Warwickshire. She turned to early memories and, encouraged by Lewes, wrote a story about a childhood episode in Chilvers Coton parish. Published in *Blackwood's Magazine* (1857) as "The Sad Fortunes of the Reverend Amos Barton," it was an instant success. Two more tales, "Mr. Gilfil's Love-Story" and "Janet's Repentance," also based on local events, appeared serially in the same year, and Blackwood republished all three as *Scenes of Clerical Life*, 2 vol. (1858) under the pseudonym George Eliot.

Adam Bede, 3 vol. (1859), her first long novel, she described as "a country story—full of the breath of cows and the scent of hay." Its mastery of realism—"the faithful representing of commonplace things"—brought to English fiction the same truthful observation of minute detail that Ruskin was commending in the Pre-Raphaelites. The book is rich in humour. The germ of the plot was an anecdote her Methodist aunt told of visiting a girl condemned for child murder. The dialect of the Bedes she had heard in the conversations of her Derbyshire uncles with her father, some of whose early experiences she assigned to Adam. But what was new in English fiction was the combination of deep human sympathy and rigorous moral judgment. *Adam Bede* went through eight printings within a year, and Blackwood doubled the £800 paid for it and returned the copyright.

In *The Mill on the Floss*, 3 vol. (1860), she returned again to the scenes of her early life. The first half of the book, with its remarkable portrayal of childhood, is irresistibly appealing, and throughout there are scenes that reach a new level of psychological subtlety.

At this time historical novels were in vogue, and during their visit to Florence in 1860 Lewes suggested Savonarola as a good subject, George Eliot grasped it enthusiastically and began to plan *Romola* (1862–63). First, however, she wrote *Silas Marner* (1861), which had thrust itself between her and the Italian material. Its brevity and perfection of form made this story of the weaver whose lost gold is replaced by a strayed child the best known of her books, though it has suffered unfairly from being forced on generations of schoolchildren. *Romola* was planned as a serial for *Blackwood's*, until an offer of £10,000 from *The Cornhill Magazine* induced George Eliot to desert her old publisher; but rather than divide the book into the 16 installments the editor wanted, she accepted £3,000 less, an

evidence of artistic integrity few writers would have shown. Details of Florentine history, setting, costume, and dialogue were scrupulously studied at the British Museum and during a second trip to Italy in 1861. It was published in 14 parts between July 1862 and August 1863. Though the book lacks the spontaneity of the English stories, it has been unduly disparaged.

George Eliot's next two novels are laid in England at the time of agitation for passage of the Reform Bill. In *Felix Holt, the Radical*, 3 vol. (1866), she drew the election riot from recollection of one she saw at Nuneaton in December 1832. The initial impulse of the book was not the political theme but the tragic character of Mrs. Transome, who was one of her greatest triumphs. The intricate plot popular taste then demanded now tells against the novel. *Middlemarch* (8 parts, 1871–72) is by general consent George Eliot's masterpiece. Under her hand the novel had developed from a mere entertainment into a highly intellectual form of art. Every class of Middlemarch society is depicted from the landed gentry and clergy to the manufacturers and professional men, the shopkeepers, publicans, farmers, and labourers. Several strands of plot are interwoven to reinforce each other by contrast and parallel. Yet the story depends not on close-knit intrigue but on showing the incalculably diffusive effect of the unhistoric acts of those who "lived faithfully a hidden life and rest in unvisited tombs."

Daniel Deronda (8 parts, 1876), in which George Eliot comes nearest the contemporary scene, is built on the contrast between Mirah Cohen, a poor Jewish girl, and the upper class Gwendolen Harleth, who marries for money and regrets it. The less convincingly realized hero, Daniel, after discovering that he is Jewish, marries Mirah and departs for Palestine to establish a home for his nation. The picture of the Cohen family evoked grateful praise from Jewish readers. But the best part of *Daniel Deronda* is the keen analysis of Gwendolen's character, which seems to many critics the peak of George Eliot's achievement.

In 1863 the Leweses bought the Priory, 21, North Bank, Regent's Park, where their Sunday afternoons became a brilliant feature of Victorian life. There on Nov. 30, 1878, Lewes died. For nearly 25 years he had fostered her genius and managed all the practical details of life, which now fell upon her. Most of all she missed the encouragement that alone made it possible for her to write. For months she saw no one but his son Charles Lee Lewes; she devoted herself to completing the last volume of his *Problems of Life and Mind* (1873–79) and founded the George Henry Lewes Studentship in Physiology at Cambridge. For some years her investments had been in the hands of John Walter Cross (1840–1924), a banker introduced to the Leweses by Herbert Spencer. Cross's mother had died a week after Lewes. Drawn by sympathy and the need for advice, George Eliot soon began to lean on him for affection too. On May 6, 1880, they were married in St. George's, Hanover Square. Cross was 40; she was in her 61st year. After a wedding trip in Italy they returned to her country house at Witley before moving to 4, Cheyne Walk, Chelsea, where she died in December. She was buried at Highgate Cemetery.

(G.S.Ha.)

MAJOR WORKS. *Novels*. *Scenes of Clerical Life*, 2 vol. (1858); "The Sad Fortunes of the Reverend Amos Barton," "Mr. Gilfil's Love-Story," and "Janet's Repentance," all first published in *Blackwood's Magazine* in 1857; *Adam Bede*, 3 vol. (1859); *The Mill on the Floss*, 3 vol. (1860); *Silas Marner: The Weaver of Raveloe* (1861); *Romola*, 3 vol. (1863; first published in *Cornhill Magazine*, 1862–63); *Felix Holt, the Radical*, 3 vol. (1866); *Middlemarch: A Study of Provincial Life*, 4 vol. (1871–72); *Daniel Deronda*, 4 vol. (1876). *Other works*. *The Spanish Gypsy* (1868), drama

in blank verse; *The Legend of Jubal and Other Poems* (1874), which ends with "Oh, May I Join the Choir Invisible"; *Impressions of Theophrastus Such* (1879), a collection of moral essays; *Essays and Leaves from a Note-Book*, ed. by C.L. Lewis (1884), mostly reprinted from journals.

BIBLIOGRAPHY. Gordon S. Haight, *George Eliot: A Biography* (1968, reissued 1985), is still the definitive life. Other biographies include Jennifer Uglow, *George Eliot* (1987); Valerie A. Dodd, *George Eliot: An Intellectual Life* (1990); and Kerry McSweeney, *George Eliot (Marian Evans): A Literary Life* (1991). Among many works of criticism, the following are especially useful: Joan Bennett, *George Eliot: Her Mind and Her Art* (1948, reissued 1962); Barbara Hardy, *The Novels of George Eliot: A Study in Form* (1959, reissued 1985), one of the subtlest general studies; Bernard J. Paris, *Experiments in Life: George Eliot's Quest for Values* (1965), concentrating on the moral and philosophical ideas in her work; Neil Roberts, *George Eliot: Her Beliefs and Her Art* (1975); Gordon S. Haight and Rosemary T. VanArsdel, *George Eliot, a Centenary Tribute* (1982); Rosemary Ashton, *George Eliot* (1983); Elizabeth Deeds Ermarth, *George Eliot* (1985); and Kristin Brady, *George Eliot* (1992).

Eliot, Jared (b. Nov. 7, 1685, Guilford, Conn. [U.S.]—d. April 22, 1763, Killingworth, Conn.), American colonial clergyman, physician, and agronomist.

Eliot, the grandson of John Eliot, noted New England missionary, was graduated from the Collegiate School of Connecticut (Yale College) in 1706. He taught for two years and then received a call as pastor of the Congregational Church in Killingworth (Clinton), Conn. He served as minister of the congregation until his death. He also became respected as a physician throughout New England.

Eliot achieved some notice through his scientific research and writing. He investigated the mineral qualities of Connecticut lands and in 1762 published *An Essay on the Invention, or Art of Making Very Good, if not the Best Iron, from Black Sea Sand*. The essay won recognition from the Royal Society in London. Eliot also worked with Yale's president Ezra Stiles on implementing silk production in Connecticut.

Eliot's major scientific contributions, however, were in the field of agronomy. He studied agricultural practices in Connecticut for several years and used his own lands for particular experiments. From that extensive research, he compiled his *Essays upon Field-Husbandry in New-England*, which was published in six parts from 1748 to 1759. Those essays became the most popular and prominent works on agronomy published in the English colonies before the American Revolution. Eliot sought to advance scientific techniques of agriculture, to improve farm production, and also to restore seemingly exhausted soils and to promote the planting of cover and forage crops.

Eliot, John (b. 1604, Widford, Hertfordshire, Eng.—d. May 21, 1690, Roxbury, Massachusetts Bay Colony [now in Massachusetts, U.S.]), Puritan missionary to the Indians of Massachusetts Bay Colony whose translation of the Bible was the first Bible printed in North America.

Eliot graduated from Jesus College, Cambridge, in 1622 and emigrated to Boston in 1631. From 1632 to his death he was pastor of the church at nearby Roxbury. With the support of his congregation and fellow ministers, he began a mission to the Indians, preaching at Nonantun (Newton) and at other towns. Groups of "praying Indians" soon arose, and by 1674 there were 14 villages with 4,000 converts. The following year, however, the communities suffered serious setbacks from persecutions that occurred during King Philip's War, and the villages never fully recovered.

Eliot's work was financed chiefly from England, where his activities inspired the creation of the Company for Propagating the Gospel

John Eliot preaching to the Massachusetts Indians, detail from an engraving by John Chester Buttre, c. 1856, after a drawing by Johannes Adam Simon Oertel, 19th century

By courtesy of the Library of Congress, Washington, D.C.

in New England and Parts Adjacent in North America (1649). This was the first genuine missionary society. Eliot's methods set the pattern of subsequent Indian missions for almost two centuries. Civilization, he believed, was closely bound up with evangelization. His converts were gathered into Christian towns, governed by a biblical code of laws, and gradually introduced to the English manner of life. Each village had a school where the Indians were taught English and the handicrafts by which they could support themselves. After severe testing, believers were organized by covenant into a Puritan "church-state," and native teachers and evangelists were trained. Eliot himself, called the "Apostle to the Indians," produced the needed literature in the Massachusetts Algonquian language, beginning with his primer or catechism of 1654. His translation of the New Testament appeared in 1661, the Old Testament in 1663. Among his other works are *The Christian Commonwealth* (1659) and *The Harmony of the Gospels* (1678).

Eliot, Sir John (b. April 11, 1592, St. Germans, Cornwall, Eng.—d. Nov. 28, 1632, London), English Puritan and Parliamentarian who, with his brilliant oratory, played a leading role in the early conflicts between King Charles I and Parliament. His death during his imprisonment for opposing the crown made him a martyr to the Parliamentary cause.

The son of a wealthy landowner, Eliot was first elected to Parliament in 1614 and was knighted four years later. In 1622 his friend George Villiers, Earl (later Duke) of Buckingham, the royal favourite, appointed him vice admiral of Devon. In 1623 Eliot succeeded in arresting a well-known pirate, Captain John

Sir John Eliot, detail of an oil painting by an unknown artist, 1632; in the collection of the Earl of St. Germans Country Life

Nutt, who thereupon used his political connections to have Eliot imprisoned for bribery. Six months later Buckingham stepped in to obtain his release.

Elected to the Parliament of 1624, Eliot won a reputation as an orator for his addresses defending freedom of speech for members of the House of Commons. He lost confidence in Buckingham after witnessing the mistakes and extravagances of Buckingham's foreign policy, and in the Parliament of 1626 he helped manage impeachment proceedings against the duke.

Charles I thereupon saved Buckingham by imprisoning Eliot (May 11–19, 1626) and dissolving Parliament. Eliot was suspended from his vice admiralty, and in June 1627 he was thrown into prison along with 74 other prominent gentry for refusing to contribute a forced loan to the crown.

Released in January 1628, he became the opposition leader in the Parliament that convened in March. There he made speeches against arbitrary taxation and in favour of preservation of English Protestantism from what he considered the Roman Catholic leanings of the archbishops. With Edward Coke and Peter Wentworth, he urged passage of the Petition of Right. In the Parliament of 1629, Eliot went further by drawing up three resolutions that vigorously condemned Charles's religious policy and his customs levies. Although Charles ordered Parliament to adjourn, Eliot had the speaker of the House of Commons held down in his chair until the resolutions were passed. The king had Eliot and eight others arrested. Imprisoned in the Tower of London, Eliot wrote several books on politics and ethics, including *An Apology for Socrates* and *The Monarchie of Man*. But his close confinement undermined his health; contracting tuberculosis, he died in the Tower. **BIBLIOGRAPHY.** Harold Hulme, *The Life of Sir John Eliot, 1592 to 1632* (1957).

Eliot, T.S., in full THOMAS STEARNS ELIOT (b. Sept. 26, 1888, St. Louis, Mo., U.S.—d. Jan. 4, 1965, London, Eng.), American-English poet, playwright, literary critic, and editor, a leader of the modernist movement in poetry in such works as *The Waste Land* (1922) and *Four Quartets* (1943). Eliot exercised a strong influence on Anglo-American culture from the 1920s until late in the century. His experiments in diction, style, and versification revitalized English poetry, and in a series of critical essays he shattered old orthodoxies and erected new ones. The publication of *Four Quartets* led to his recognition as the greatest living English poet and man of letters, and in 1948 he was awarded both the Order of Merit and the Nobel Prize for Literature.

Early years. Eliot was descended from a distinguished New England family that had relocated to St. Louis, Mo. His family allowed him the widest education available in his time, with no influence from his father to be "practical" and to go into business. From Smith Academy in St. Louis he went to Milton, in Massachusetts; from Milton he entered Harvard in 1906; he was graduated B.A. in 1909, after three instead of the usual four years. The men who influenced him at Harvard were George Santayana, the philosopher and poet, and the critic Irving Babbitt. From Babbitt he derived an anti-Romantic attitude that, amplified by his later reading of British philosophers F.H. Bradley and T.E. Hulme, lasted through his life. In the academic year 1909–10 he was an assistant in philosophy at Harvard.

He spent the year 1910–11 in France, attending Henri Bergson's lectures in philosophy at the Sorbonne and reading poetry with Alain-

Fournier. Eliot's study of the poetry of Dante, of the English writers John Webster and John Donne, and of the French Symbolist Jules Laforgue helped him to find his own style. From 1911 to 1914 he was back at Harvard reading Indian philosophy and studying Sanskrit. In 1913 he read Bradley's *Appearance and Reality*; by 1916 he had finished, in Europe, a dissertation entitled *Knowledge and Experience in the Philosophy of F.H. Bradley*. But World War I had intervened, and he never returned to Harvard to take the final oral examination for the Ph.D. degree. In 1914 Eliot met and began a close association with the American poet Ezra Pound.

T.S. Eliot, 1954
Angus McBean

Early publications. Eliot was to pursue four careers: editor, dramatist, literary critic, and philosophical poet. He was probably the most erudite poet of his time in the English language. His undergraduate poems were "literary" and conventional. His first important publication, and the first masterpiece of "modernism" in English, was "The Love Song of J. Alfred Prufrock."

Let us go then, you and I,

When the evening is spread out against the sky
Like a patient etherized upon a table. . . .

Although Pound had printed privately a small book, *A lume spento*, as early as 1908, "Prufrock" was the first poem by either of these literary revolutionists to go beyond experiment to achieve perfection. It represented a break with the immediate past as radical as that of Samuel Taylor Coleridge and William Wordsworth in *Lyrical Ballads* (1798). From the appearance of Eliot's first volume, *Prufrock and Other Observations*, in 1917, one may conveniently date the maturity of the 20th-century poetic revolution. The significance of the revolution is still disputed, but the striking similarity to the Romantic revolution of Coleridge and Wordsworth is obvious: Eliot and Pound, like their 18th-century counterparts, set about reforming poetic diction. Whereas Wordsworth thought he was going back to the "real language of men," Eliot struggled to create new verse rhythms based on the rhythms of contemporary speech. He sought a poetic diction that might be spoken by an educated person, being "neither pedantic nor vulgar."

For a year Eliot taught French and Latin at the Highgate School; in 1917 he began his brief

career as a bank clerk in Lloyds Bank Ltd. Meanwhile he was also a prolific reviewer and essayist in both literary criticism and technical philosophy. In 1919 he published *Poems*, which contained the poem "Gerontion," a meditative interior monologue in blank verse: nothing like this poem had appeared in English.

The Waste Land and criticism. With the publication in 1922 of his poem *The Waste Land*, Eliot won an international reputation. *The Waste Land* expresses with great power the disenchantment, disillusionment, and disgust of the period after World War I. In a series of vignettes, loosely linked by the legend of the search for the Grail, it portrays a sterile world of panicky fears and barren lusts, and of human beings waiting for some sign or promise of redemption. The poem's style is highly complex, erudite, and allusive, and the poet provided notes and references to explain the work's many quotations and allusions. This scholarly supplement distracted some readers and critics from perceiving the true originality of the poem, which lay rather in its rendering of the universal human predicament of man desiring salvation, and in its manipulation of language, than in its range of literary references. In his earlier poems Eliot had shown himself to be a master of the poetic phrase. *The Waste Land* showed him to be, in addition, a metrist of great virtuosity, capable of astonishing modulations ranging from the sublime to the conversational.

The Waste Land consists of five sections and proceeds on a principle of "rhetorical discontinuity" that reflects the fragmented experience of the 20th-century sensibility of the great modern cities of the West. Eliot expresses the hopelessness and confusion of purpose of life in the secularized city, the decay of *urbs aeterna* (the "eternal city"). This is the ultimate theme of *The Waste Land*, concretized by the poem's constant rhetorical shifts and its juxtapositions of contrasting styles. But *The Waste Land* is not a simple contrast of the heroic past with the degraded present; it is rather a timeless, simultaneous awareness of moral grandeur and moral evil. The poem's original manuscript of about 800 lines was cut down to 433 at the suggestion of Ezra Pound. *The Waste Land* is not Eliot's greatest poem, though it is his most famous.

Eliot said that the poet-critic must write "programmatic criticism"—that is, criticism that expresses the poet's own interests as a poet, quite different from historical scholarship, which stops at placing the poet in his background. Consciously intended or not, Eliot's criticism created an atmosphere in which his own poetry could be better understood and appreciated than if it had to appear in a literary milieu dominated by the standards of the preceding age. In the essay "Tradition and the Individual Talent," appearing in his first critical volume, *The Sacred Wood* (1920), Eliot asserts that tradition, as used by the poet, is not a mere repetition of the work of the immediate past ("novelty is better than repetition," he said); rather, it comprises the whole of European literature from Homer to the present. The poet writing in English may therefore make his own tradition by using materials from any past period, in any language. This point of view is "programmatic" in the sense that it disposes the reader to accept the revolutionary novelty of Eliot's polyglot quotations and serious parodies of other poets' styles in *The Waste Land*.

Also in *The Sacred Wood*, "Hamlet and His Problems" sets forth Eliot's theory of the objective correlative:

The only way of expressing emotion in the form of art is by finding an "objective correlative"; in other words, a set of objects, a situation, a chain of events which shall be the formula for that particular emotion; such that, when the external facts, which must terminate in sensory ex-

perience, are given, the emotion is immediately evoked.

Eliot used the phrase "objective correlative" in the context of his own impersonal theory of poetry; it thus had an immense influence toward correcting the vagueness of late Victorian rhetoric by insisting on a correspondence of word and object. Two other essays, first published the year after *The Sacred Wood*, almost complete the Eliot critical canon: "The Metaphysical Poets" and "Andrew Marvell," published in *Selected Essays, 1917-32* (1932). In these essays he effects a new historical perspective on the hierarchy of English poetry, putting at the top Donne and other Metaphysical poets of the 17th century and lowering poets of the 18th and 19th centuries. Eliot's second famous phrase appears here—"dissociation of sensibility," invented to explain the change that came over English poetry after Donne and Andrew Marvell. This change seems to him to consist in a loss of the union of thought and feeling. The phrase has been attacked, yet the historical fact that gave rise to it cannot be denied, and with the poetry of Eliot and Pound it had a strong influence in reviving interest in certain 17th-century poets.

The first, or programmatic, phase of Eliot's criticism ended with *The Use of Poetry and the Use of Criticism* (1933)—his Charles Eliot Norton lectures at Harvard. Shortly before this his interests had broadened into theology and sociology; three short books, or long essays, were the result: *Thoughts After Lambeth* (1931), *The Idea of a Christian Society* (1939), and *Notes Towards the Definition of Culture* (1948). These book-essays, along with his *Dante* (1929), an indubitable masterpiece, broadened the base of literature into theology and philosophy: whether a work is poetry must be decided by literary standards; whether it is great poetry must be decided by standards higher than the literary.

Eliot's criticism and poetry are so interwoven that it is difficult to discuss them separately. The great essay on Dante appeared two years after Eliot was confirmed in the Church of England (1927); in that year he also became a British subject. The first long poem after his conversion was "Ash Wednesday" (1930), a religious meditation in a style entirely different from that of any of the earlier poems. "Ash Wednesday" expresses the pangs and the strain involved in the acceptance of religious belief and religious discipline. This and subsequent poems were written in a more relaxed, musical, and meditative style than his earlier works, in which the dramatic element had been stronger than the lyrical. "Ash Wednesday" was not well received in an era that held that poetry, though autonomous, is strictly secular in its outlook; it was misinterpreted by some critics as an expression of personal disillusion.

Later poetry and plays. Eliot's masterpiece is *Four Quartets*, which was issued as a book in 1943, though each "quartet" is a complete poem. The first of the quartets, "Burnt Norton," had appeared in the *Collected Poems* of 1936. It is a subtle meditation on the nature of time and its relation to eternity. On the model of this Eliot wrote three more poems, "East Coker" (1940), "The Dry Salvages" (1941), and "Little Gidding" (1942), in which he explored through images of great beauty and haunting power his own past, the past of the human race, and the meaning of human history. Each of the poems was self-sufficient; but when published together they were seen to make up a single work, in which themes and images recurred and were developed in a musical manner and brought to a final resolution. This work made a deep impression on the reading public, and even those who were unable to accept the poems' Christian beliefs recognized the intellectual integrity with which Eliot pursued his high theme, the origi-

inality of the form he had devised, and the technical mastery of his verse. This work led to the award to Eliot, in 1948, of the Nobel Prize for Literature.

An outstanding example of Eliot's verse in *Four Quartets* is the passage in "Little Gidding" in which the poet meets a "compound ghost," a figure composite of two of his masters: William Butler Yeats and Stéphane Mallarmé. The scene takes place at dawn in London after a night on duty at an air-raid post during an air-attack; the master speaks in conclusion:

From wrong to wrong the exasperated spirit
Proceeds, unless restored by that refining fire
Where you must move in measure, like a dancer.
The day was breaking. In the disfigured street
He left me, with a kind of valediction,
And faded on the blowing of the horn.

The passage is 72 lines, in modified terza rima; the diction is as near to that of Dante as is possible in English; and it is a fine example of Eliot's belief that a poet can be entirely original when he is closest to his models.

Eliot's plays, which begin with *Sweeney Agonistes* (published 1926; first performed in 1934) and end with *The Elder Statesman* (first performed 1958; published 1959), are, with the exception of *Murder in the Cathedral* (published and performed 1935), inferior to the lyric and meditative poetry. Eliot's belief that even secular drama attracts people who unconsciously seek a religion led him to put drama above all other forms of poetry. All his plays are in a blank verse of his own invention, in which the metrical effect is not apprehended apart from the sense; thus he brought "poetic drama" back to the popular stage. *The Family Reunion* (1939) and *Murder in the Cathedral* are Christian tragedies, the former a tragedy of revenge, the latter of the sin of pride. *Murder in the Cathedral* is a modern miracle play on the martyrdom of Thomas Becket. The most striking feature of this, his most successful play, was the use of a chorus in the traditional Greek manner to make apprehensible to common humanity the meaning of the heroic action. *The Family Reunion* (1939) was less popular. It contained scenes of great poignancy and some of the finest dramatic verse since the Elizabethans; but the public found this translation of the story of Orestes into a modern domestic drama baffling and was uneasy at the mixture of psychological realism, mythical apparitions at a drawing-room window, and a comic chorus of uncles and aunts.

After World War II, Eliot returned to writing plays with *The Cocktail Party* in 1949, *The Confidential Clerk* in 1953, and *The Elder Statesman* in 1958. These plays are comedies in which the plots are derived from Greek drama. In them Eliot accepted current theatrical conventions at their most conventional, subduing his style to a conversational level and eschewing the lyrical passages that gave beauty to his earlier plays. Only *The Cocktail Party*, which is based upon the *Alceste* of Euripides, achieved a popular success. In spite of their obvious theatrical defects and a failure to engage the sympathies of the audience for the characters, these plays succeed in handling moral and religious issues of some complexity while entertaining the audience with farcical plots and some shrewd social satire.

Eliot's career as editor was ancillary to his main interests, but his quarterly review, *The Criterion* (1922–39), was the most distinguished international critical journal of the period. He was a "director," or working editor, of the publishing firm of Faber & Faber Ltd. from the early 1920s until his death, and as such was a generous and discriminating patron of young poets.

Eliot always kept his private life rigorously in the background. In 1915 he married Vivian

Haigh-Wood; after 1933 she was mentally ill, and they lived apart; she died in 1947. In January 1957 he married Valerie Fletcher, with whom he lived happily until his death.

(A.Ta./Hn.G.)

BIBLIOGRAPHY. Surveys of his life and career include Lyndall Gordon, *Eliot's Early Years* (1977), and *Eliot's New Life* (1988); Peter Ackroyd, *T.S. Eliot* (1984); and Alzina Stone Dalc, *T.S. Eliot, the Philosopher Poet* (1988), with a discussion of his spiritual growth. Allen Tate (ed.), *T.S. Eliot: The Man and His Work* (1966), is a retrospective symposium and includes personal reminiscence and criticism by 26 critics. Three distinguished works on Eliot are Elizabeth Drew, *T.S. Eliot: The Design of His Poetry* (1950), a Jungian interpretation of Eliot's symbolism; F.O. Matthiessen, *The Achievement of T.S. Eliot*, 3rd ed. (1958), with a supplementary chapter by C.L. Barber covering the works written after Matthiessen's death in 1950; and Helen Gardner, *The Art of T.S. Eliot* (1949, reprinted 1979), a brilliantly perceptive study. Other valuable studies are Cleanth Brooks, *Modern Poetry and the Tradition* (1939, reissued 1979), the most perceptive analytic commentary on *The Waste Land*; Hugh Kenner, *The Invisible Poet* (1959, reissued 1969); David E. Jones, *The Plays of T.S. Eliot* (1960); E. Martin Browne, *The Making of T.S. Eliot's Plays* (1969), a work indispensable to the understanding of Eliot's methods of dramatic composition; Grover Smith, *T.S. Eliot's Poetry and Plays*, 2nd ed. (1974), and *The Waste Land* (1983); Stephen Spender, *Eliot* (1975, also published as *T.S. Eliot*, 1976); David Newton-Molina (compiler and ed.), *The Literary Criticism of T.S. Eliot: New Essays* (1977); and Ronald Bush, *T.S. Eliot: A Study in Character and Style* (1984). Michael Grant (ed.), *T.S. Eliot: The Critical Heritage*, 2 vol. (1982), collects contemporary reviews of his poetry and plays. Graham Clarke (ed.), *T.S. Eliot: Critical Assessments*, 4 vol. (1990), partially overlaps the previous work but also contains reviews and critical essays on Eliot's works of criticism.

Eliphaz the Temanite, in the Old Testament Book of Job (chapters 4, 5, 15, 22), one of three friends who sought to console Job, who is a biblical archetype of unmerited suffering. The word Temanite probably indicates that he was an Edomite, or member of a Palestinian people descended from Esau.

In three speeches of increasing severity, Eliphaz attempts to reconcile Job to God and induce him to repent. In the first speech he recounts a mystic vision that informed him of the universal sinfulness of man—proof that suffering is never unmerited. In the second speech he belittles Job's self-justifications by describing the uncaring transcendence of God. In the third and last speech he reflects the old Hebrew idea that suffering always implies sinful actions by accusing Job of specific unethical deeds. In the epilogue he and his friends are reproved by God for not speaking the truth about him.

Elis, also called **ELEA**, modern **ILIÁ**, ancient Greek region and city-state in the northwestern corner of the Peloponnese, well known for its horse breeding and for the Olympic Games, which were allegedly founded there in 776 BC.

The region was bounded on the north by Achaëa, on the east by Arcadia, and on the south by Messenia. Elis consisted of three districts from north to south: Hollow Elis, which occupied the basin of the Peneus River; Pisatis, occupying the north bank of the Alpheus River; and Triphylia, a hilly area stretching south from the Alpheus to the northern border of Messenia. Comparatively high rainfall produced good pasture and arable land in low-lying areas, and the region became noted for its horses, cattle, and flax.

The Olympic Games were celebrated every four years at the sanctuary of Olympia, on the north bank of the Alpheus River. The city of Elis, located in Hollow Elis, engaged in a long struggle with the Pisatians for control of the games until 572 BC, when the Eleans deci-

sively subjugated the Pisatians. Having gained control of the entire region by 580, the city of Elis briefly joined Sparta in an anti-Persian alliance (479), then broke with Sparta, adopted a democratic constitution (c. 471), and became the administrative centre of a union of smaller townships. During the Peloponnesian War, Elis again allied with Sparta until 420, when it defected to the side of Athens. Sparta subsequently punished Elis for its defection by stripping it of Triphylia, and Elis's attempts to recover the latter were repeatedly frustrated by Sparta and then by Arcadia. But by adroit diplomacy and by emphasizing the sanctity of the Olympic Games (and the neutrality of Elis as the games' host), the city was able to retain its territory and in some sense even its independence after the Roman occupation of Greece (146 BC), only to disintegrate with the collapse of the Roman Empire.

The modern-day locality contains one of the finest archaeological sites in modern Greece, that of Olympia, scene of the games. The area is now part of Iliá nomos (department), and its principal towns are Pyrgos and Amalías.

Elisabetta (Italian personal name): see under Elizabeth; Isabella.

Elisha, also spelled **ELISAIOS**, or **ELISEUS**, in the Old Testament, Israelite prophet, the pupil of Elijah, and also his successor (c. 851). He instigated and directed Jehu's revolt against the house of Omri, which was marked by a bloodbath at Jezreel in which King Ahab of Israel and his family were slaughtered.

The popular traditions about Elisha (2 Kings 2–13) sketch a charismatic, quasi-ecstatic figure, very similar to Elijah. Like his mentor, Elisha was a passionate exponent of the ancient religious and cultural traditions of Israel, which both felt to be threatened by the ruling dynasty of Omri, which was in alliance with Phoenicia. (King Ahab's wife, the Tyrian princess Jezebel, was then trying to introduce the worship of Baal into Israel.) As a prophet, Elisha was a political activist and revolutionary. He led a "holy war" that extinguished the house of Omri in Jerusalem as well as in Samaria (2 Kings 9–10).

Though Elisha recruited Jehu to revolt against and succeed Ahab, it was Elijah who was instructed to anoint Jehu as Israel's king (1 Kings 19:16). This is characteristic of the relationship between the two prophets; in popular estimation Elisha always remains partly in the shadow of his master. The story of the beginning of his apprenticeship (1 Kings 19:19–21) and the account in which he becomes Elijah's heir and successor (2 Kings 2:8–18) both feature the prophetic "mantle." In the first, Elijah casts it upon his pupil; in the second, Elisha picks it up. The mantle, cultic garment of the prophet, carries connotations of power and authority.

Elisha ben Abuyah, byname **AHER** (fl. c. AD 100), Jewish scholar who renounced his faith and who came to be regarded in later ages as a prototype of the heretic whose intellectual pride leads him to infidelity to Jewish laws and morals. In the Talmud, Elisha is not mentioned by name but is usually referred to as Aher ("the Other," or "Another"). His renunciation of Judaism was considered doubly heinous because he was a tanna (scholar), one of a group of some 200 masters of the Oral Law that flourished in Palestine during the 1st and 2nd centuries AD.

The son of a rich Jew, Elisha was educated

from childhood to be a scholar. Although he became a tanna, he lost faith in rabbinic authority and flouted Jewish law by such actions as openly riding through the streets on the most sacred Jewish holiday, Yom Kippur (the Day of Atonement). More seriously, the Talmud relates that Elisha betrayed Jews during a period of persecution by the Roman emperor Hadrian (AD 76–138).

Different versions of the Talmud contain cryptic references to Elisha's heretical acts and the reason for his renunciation of Judaism. According to one tradition he became so interested in Greek culture and philosophy that he abandoned his heritage; another relates an incident that implies Elisha's belief in two gods. Later scholars, studying these passages, offered different, and sometimes contradictory, interpretations. Some concluded that Elisha was a follower of Philo of Alexandria, a philosopher whose theological views were considered heretical by contemporary Jews. Others saw Elisha variously as a convert to Christianity, a member of a Gnostic sect, or a Sadducee. Whatever the reason for his apostasy, Elisha's story became the subject of later literary works, among them the Hebrew drama *Ben Abuyah*.

Elisio, Filinto: *see* Nascimento, Francisco Manuel do.

elision (Latin: "striking out"), in prosody, the slurring or omission of a final unstressed vowel that precedes either another vowel or a weak consonant sound, as in the word *heav'n*. It may also be the dropping of a consonant between vowels, as in the word *o'er* for *over*. Elision is used to fit words into a metrical scheme, to smooth the rhythm of a poem, or to ease the pronunciation of words. In classical Greek poetry, an apostrophe (') is substituted for an elided letter, as is frequently the case in English verse. In Latin, however, the elided vowel or consonant remains, but it is ignored in scanning the line.

Elissa (Greek mythology): *see* Dido.

Elista, formerly (1944–57) STEPNOY, city and capital of Kalmykia republic, southwestern Russia. It was founded in 1865 and became a city in 1930. In 1944, when the Kalmyks were exiled by Joseph Stalin for their alleged collaboration with the Germans, the republic was dissolved and the city became known as Stepnoy ("Steppe"). The Kalmyk A.S.S.R. and the name Elista were restored in 1957. Agriculture employs the most workers, though Elista also has administrative, trade, and cultural services for its surrounding area. Kalmyk State University (1970) and teacher-training and medical colleges are located there. Pop. (1991 est.) 95,200.

elixir, in alchemy, substance thought to be capable of changing base metals into gold. The same term, more fully *elixir vitae*, "elixir of life," was given to the substance that would indefinitely prolong life—a liquid that was believed to be allied with the philosopher's stone. Chinese Taoists not only sought the "pill of immortality" but developed techniques (meditation, breathing exercises, diet) that were thought to confer immortality by internal alchemy.

In pharmacy, an elixir is usually defined as a sweetened hydroalcoholic solution containing flavouring materials and usually medicinal substances.

ENGLAND AND THE UNITED KINGDOM

• **Elizabeth I**, byname THE VIRGIN QUEEN, or GOOD QUEEN BESS (b. Sept. 7, 1533, Greenwich, near London, Eng.—d. March 24, 1603, Richmond, Surrey), queen of England (1558–1603) during a period, often called the Elizabethan Age, when England asserted itself vigorously as a major European power in politics, commerce, and the arts.

A brief treatment of Elizabeth I follows. For full treatment, *see* MACROPAEDIA: Elizabeth I of England.

Elizabeth's childhood was marked by dangers from political and religious intrigue, and in the reign of her half sister, Mary I, daughter of Henry VIII's first wife, Catherine of Aragon, she was for a time imprisoned in the Tower of London. She became queen upon Mary's death (1558) and in the first 12 years of her reign established her popularity with the people. Her religious settlement of 1559 enforced the Protestant religion by law but was not unduly harsh to the Roman Catholics. This compromise, however, was shattered in 1570 by the interdict of Pope Pius V against Elizabeth, and thereafter the treatment of English Roman Catholics became increasingly severe.

Despite various marriage plans designed to accommodate state interests—especially the crucial interest of securing the succession—and in spite of speculation about her friendships with several men, including Robert Dudley (Earl of Leicester), Elizabeth never married. Elizabeth's claim to the throne was threatened by Mary, Queen of Scots, a descendant of Henry VIII's sister Margaret; Mary's claim to the English throne was based on the questionable legality of Henry's second marriage to Anne Boleyn, Elizabeth's mother. The queen finally had Mary executed (1587). In 1588 the Spanish Armada was destroyed by the English fleet that Elizabeth had built.

The last years of her reign saw an economic decline and a series of disastrous military efforts to subdue the Irish. Public morale deteriorated. Elizabeth, who had outlived her most trusted friends and advisers, including Lord Burghley and Francis Walsingham, was left with more personally ambitious men, including Robert Devereux, Earl of Essex, who was executed for high treason in 1601. Elizabeth reportedly acknowledged James VI of Scotland as her successor on her deathbed.

• **Elizabeth II**, in full ELIZABETH ALEXANDRA MARY, officially ELIZABETH II, BY THE GRACE OF GOD, OF THE UNITED KINGDOM OF GREAT BRITAIN AND NORTHERN IRELAND AND OF HER OTHER REALMS AND TERRITORIES QUEEN, HEAD OF THE COMMONWEALTH, DEFENDER OF THE FAITH (b. April 21, 1926, London, Eng.), queen of the United Kingdom of Great Britain and Northern Ireland from Feb. 6, 1952.

Elizabeth was the elder daughter of Albert, Duke of York, and his wife, Lady Elizabeth Bowes-Lyon. As the child of a younger son of King George V, the young Elizabeth had little prospect of acceding to the throne until her uncle, Edward VIII (afterward Duke of Windsor), abdicated in her father's favour on Dec. 11, 1936, at which time her father became King George VI and she became heir presumptive. The princess's education was supervised by her mother, who entrusted her daughters to a governess, Marion Crawford; the princess was also grounded in history by C.H.K. Marten, afterward provost of Eton College, and had instruction from visit-

ing teachers in music and languages. During World War II, she and her sister, Princess Margaret Rose, perforce spent much of their time safely away from the London blitz and separated from their parents, living mostly at Balmoral Castle in Scotland and at the Royal Lodge, Windsor, and Windsor Castle.

Early in 1947 Princess Elizabeth went with the king and queen to South Africa. After her return, there was an announcement of her betrothal to her distant cousin Lieutenant Philip Mountbatten of the Royal Navy, formerly Prince Philip of Greece and Denmark. The marriage took place in Westminster Abbey on Nov. 20, 1947. On the eve of the wedding her father, the king, conferred upon the bridegroom the titles of Duke of Edinburgh, Earl of Merioneth, and Baron Greenwich. They took residence at Clarence House in London. Their first child, Prince Charles (Charles Philip Arthur George), was born Nov. 14, 1948, at Buckingham Palace.

In the summer of 1951 the health of King George VI entered into a serious decline, and Princess Elizabeth represented him at the Trooping the Colour and on various other state occasions. On October 7 she and her husband set out on a highly successful tour of Canada and Washington, D.C. After Christmas in England, she and the duke set out in January 1952 for a tour of Australia and New Zealand, but en route, at Sagana, Kenya, news reached them of the king's death on Feb. 6, 1952. Elizabeth, now queen, at once flew back to England. The first three months of her reign, the period of full mourning for her father, were passed in comparative seclusion. But in the summer, after she had moved from Clarence House to Buckingham Palace, she undertook the routine duties of the sovereign and carried out her first state opening of Parliament on Nov. 4, 1952. Her coronation was held at Westminster Abbey on June 2, 1953.

Beginning in November 1953 the queen and the Duke of Edinburgh made a six-month round-the-world tour of the Commonwealth, which included the first visit to Australia and New Zealand by a reigning British monarch. In 1957, after state visits to various European nations, she and the duke visited Canada and the United States. In 1961 she made the first royal British tour of the Indian subcontinent in 50 years, and she was also the first reigning British monarch to visit South America (in 1968) and the Persian Gulf countries (in 1979). During her "Silver Jubilee" in 1977, she presided at a London banquet attended by the leaders of the 36 members of the Commonwealth, traveled all over Britain and Northern Ireland, and toured overseas in the South Pacific and Australia, in Canada, and in the Caribbean.

On the accession of Queen Elizabeth, her son Prince Charles became heir apparent; he was named Prince of Wales on July 26, 1958, and was so invested on July 1, 1969. The queen's other children were Princess Anne (Anne Elizabeth Alice Louise), born Aug. 15, 1950; Prince Andrew (Andrew Albert Christian Edward), born Feb. 19, 1960, and created Duke of York in 1986; and Prince Edward (Edward Anthony Richard Louis), born March 10, 1964. All these children have the surname "of Windsor," but in 1960 Elizabeth decided to create the hyphenated name Mountbatten-Windsor for other descendants not styled prince or princess and royal highness. Elizabeth's first grandchild (Princess Anne's son) was born on Nov. 15, 1977.

The queen seemed increasingly aware of the modern role of the monarchy, allowing, for example, the televising of the royal family's domestic life in 1970 and condoning the formal dissolution of her sister's marriage in 1978. She was known to favour simplicity in court life and was also known to take a serious and informed interest in government business, aside from the traditional and cer-

Elizabeth II, 1985

Karsh—Camera Press/Globe Photos

emotional duties. Privately she has become a keen horsewoman; she keeps racehorses, frequently attends races, and periodically visits the stud farms of Kentucky, U.S. Her financial and property holdings have made her one of the world's richest women.

RUSSIA

• **Elizabeth**, Russian in full YELIZAVETA PETROVNA (b. Dec. 18 [Dec. 29, New Style], 1709, Kolomenskoye, near Moscow, Russia—d. Dec. 25, 1761 [Jan. 5, 1762], St. Petersburg), empress of Russia from 1741 to 1761 (1762, New Style).

The daughter of Peter I the Great (reigned 1682–1725) and Catherine I (reigned 1725–27), Elizabeth grew up to be a beautiful, charming, intelligent, and vivacious young woman.

Elizabeth, empress of Russia, detail of a portrait by an unknown artist, 18th century; in the collection of Mrs. Merrweather Post, Hillwood, Washington, D.C.

By courtesy of Mrs. Merrweather Post, Hillwood, Washington D.C.

Despite her talents and popularity, particularly among the guards, she played only a minor political role during the reigns of Peter II (reigned 1727–30) and Empress Anna (reigned 1730–40). But when Anna Leopoldovna assumed the regency for her son Ivan VI (1740–41) and threatened Elizabeth with banishment to a convent, the young princess allowed herself to be influenced by the French ambassador and members of the Russian court who hoped to reduce German domination over Russian affairs and reverse Russia's pro-Austrian, anti-

French foreign policy. On the night of Nov. 24–25 (Dec. 5–6), 1741, she staged a coup d'état, arresting the infant emperor, his mother, and their chief advisers; after summoning all the civil and ecclesiastical notables of St. Petersburg, Elizabeth was proclaimed empress of Russia.

Upon ascending the throne, Elizabeth abolished the Cabinet council system of government that had been employed by her predecessors and formally reconstituted the Senate as it had been created by her father. As a result of this and similar measures, her reign has been generally characterized as a return to the principles and traditions of Peter the Great. In fact, Elizabeth's restoration of the Senate as the chief governing body was only nominal (the country really being ruled by her private chancery), and the empress actually abolished some of her father's major reforms. Furthermore, rather than assume a dominant role in government as Peter had done, Elizabeth occupied herself with splendid court and church activities and the purchase of stylish Western clothing. She also encouraged the development of education and art, founding Russia's first university (in Moscow) and the Academy of Arts (in St. Petersburg) and building the extravagant Winter Palace (also in St. Petersburg). She left control of most state affairs to her advisers and favourites, under whose leadership the effectiveness of Russia's government was handicapped by continual court intrigues; the country's financial situation deteriorated; and the gentry acquired broad privileges at the expense of the peasantry.

Simultaneously, however, Russia's prestige as a major European power grew. Guided by Aleksey Bestuzhev-Ryumin, who enjoyed Elizabeth's complete confidence, the country firmly adhered to a pro-Austrian, anti-Prussian foreign policy, annexed a portion of southern Finland after fighting a war with Sweden (1741–43), improved its relations with Great Britain, and successfully conducted hostilities against Prussia during the Seven Years' War (1756–63).

Before Russia and its allies, France and Austria, could force Prussia's collapse, however, Elizabeth died, leaving her throne to her nephew Peter III, who was a great admirer of Frederick II the Great of Prussia and who withdrew Russia from the war.

SPAIN

• **Elizabeth I-II:** see Isabella I-II.

Elizabeth (b. Dec. 24, 1837, Munich, Bavaria [Germany]—d. Sept. 10, 1898, Geneva, Switzerland), empress consort of Austria from April 24, 1854, when she married the emperor Francis Joseph I. She was also queen of Hungary (crowned June 8, 1867) after the Austro-Hungarian *Ausgleich*, or Compromise. Her assassination brought her rather unsettled life to a tragic end.

Elizabeth was the daughter of the Bavarian duke Maximilian Joseph. In August 1853 she met her cousin Francis Joseph, then aged 23, who quickly fell in love with the 15-year-old Elizabeth, who was regarded as the most beautiful princess in Europe. Soon after their marriage she showed a neurotic restlessness that may have been derived from her Wittelsbach ancestors. Generally popular with her subjects, she offended Viennese high society by her impatience with the rigid etiquette of the court.

The Hungarians admired her, especially for her endeavours in bringing about the Compromise of 1867. She spent much time at Gödöllő, north of Budapest. Her enthusiasm for Hungary, however, affronted German sentiment within Austria. She partly assuaged Austrian feelings by her care for the wounded in the Seven Weeks' War of 1866.

The suicide of her only son, the crown prince Rudolf, in 1889, was a shock from which Elizabeth never fully recovered.

It was during a visit to Switzerland that she was mortally stabbed by an Italian anarchist, Luigi Luccheni.

Elizabeth, in full ELIZABETH ANGELA MARGUERITE, *née* BOWES-LYON, also called (1923–36) DUCHESS OF YORK, or (from 1952) QUEEN ELIZABETH, THE QUEEN MOTHER (b. Aug. 4, 1900, St. Paul's Waldenbury, Hitchin, Hertfordshire, Eng.—d. March 30, 2002, Windsor, Berkshire), queen consort of the United Kingdom of Great Britain and Ireland (1936–52), wife of King George VI. She was credited with sustaining the monarchy through numerous crises, including the abdication of Edward VIII and the death of Princess Diana.

The Lady Elizabeth Bowes-Lyon was the youngest daughter of Claude George Bowes-Lyon, 14th Earl of Strathmore and Kinghorne (d. 1944); the Bowes-Lyon family could claim descent from Robert I the Bruce, king of Scotland. On April 26, 1923, Elizabeth was married to Albert, Duke of York, second son of King George V. This marriage was a popular departure from the long-standing practice of an English prince marrying into a foreign royal family.

On Dec. 11, 1936, upon the abdication of Edward VIII and the accession of her husband as George VI, Elizabeth became queen consort. She never forgave Edward, afterward Duke of Windsor, for having abandoned the throne to George, without the latter's adequate anticipation or preparation. Shy and prone to melancholy, George seemed ill-suited for the role of king. Elizabeth's unflagging support, however, helped transform him into a confident and much respected monarch. As queen consort, Elizabeth also enjoyed great popularity, enhanced, in part, by her actions during World War II, when she refused to leave London during German air raids, even after Buckingham Palace was bombed. Many credit her with setting the tone for the modern monarchy, as she eased formalities and established an unprecedented rapport with the public.

Elizabeth bore two daughters, Princess Elizabeth Alexandra Mary, the future queen Elizabeth II (b. April 21, 1926), and Princess Margaret Rose, the future Countess of Snowden (b. Aug. 21, 1930—d. Feb. 9, 2002). After her husband's death on Feb. 6, 1952, and the accession of Elizabeth II, she became known officially as Her Majesty Queen Elizabeth, the Queen Mother. She remained one of the most popular and admired members of the royal family.

Elizabeth, city, seat (1857) of Union county, northeastern New Jersey, U.S., on Newark Bay and Arthur Kill (connected by bridge to Staten Island, N.Y.). It is adjacent to Newark. Settlement began in 1664 with the purchase of land from the Delaware Indians. It was named Elizabethtown to honour the wife of Sir George Carteret, one of the colony's first proprietors. The first colonial assembly met there from 1668 to 1682. In 1740 it was chartered as the "free borough and town of Elizabeth." Elizabeth suffered severely during the American Revolution and was the scene of four military engagements. In the 1830s the Port of Staten Island was developed, which, together with the coming of the railroads, assured Elizabeth's steady growth. The city is highly industrialized, with important shipping operations including the Elizabeth-Port Authority Marine Terminal, with facilities for containerized shipping. Manufactures include sewing machines (the Singer Company relocated there in 1873), textiles, chemicals, automobiles, and machinery. Princeton University originated (1746) in Elizabeth as the College

of New Jersey. Boxwood Hall, now a state historic site, was the home of Elias Boudinot, president of the Continental Congress in 1783. Alexander Hamilton and Aaron Burr both attended the old academy (burned by the British in 1780) situated where the city's First Presbyterian Church parish house now stands. Inc. city, 1855. Pop. (1992 est.) 107,915.

Elizabeth OF BAVARIA: see Isabella of Bavaria.

Elizabeth OF FRANCE, French *Élisabeth de France*, in full *Élisabeth-Philippine-Marie-Hélène*, byname *Madame Élisabeth* (b. May 3, 1764, Versailles, France—d. May 10, 1794, Paris), French princess, sister of King Louis XVI, noted for her courage and fidelity during the French Revolution, which sacrificed her to the guillotine.

She was the youngest daughter of the dauphin Louis (d. 1765) and Maria Josepha of Saxony. Whereas her aunt and two of her brothers (the future Louis XVIII and Charles X) emigrated, Madame Élisabeth refused to leave Louis XVI and queen consort Marie-Antoinette at grips with the Revolution. She was imprisoned with them in the Temple after the suspension of the monarchy on Aug. 10, 1792, and shared all the hardships that this involved. She was sentenced to death by the Revolutionary tribunal. The fortitude and patience with which she bore her trials won lasting respect, especially in Catholic and royalist circles.

The *Mémoires de Madame Élisabeth*, edited by F. de Baghion Fort-Rion (1858), are of doubtful authenticity, as are the *Correspondance de Madame Élisabeth de France*, edited by F. Feuillet de Conches (1868). *The Life and Letters of Madame Élisabeth de France* (1902) was translated by K.P. Wormeley.

Elizabeth OF HUNGARY, SAINT, German *Sankt Elisabeth von Ungarn* (b. 1207, probably Pressburg, Hungary [now Bratislava, Slovakia]—d. Nov. 17, 1231, Marburg, Thuringia [Germany]; canonized 1235; feast day November 17), princess of Hungary whose devotion to the poor (for whom she relinquished her wealth) made her an enduring symbol of Christian charity.

The daughter of King Andrew II of Hungary, she was betrothed in infancy to Louis IV, son of Hermann I, landgrave of Thuringia, at whose court she was brought up. The marriage, which occurred when Louis succeeded his father in 1221, proved to be ideal but brief. Louis died in 1227 of plague at Otranto, Italy, en route to the Sixth Crusade. When his brother Henry assumed the regency, Elizabeth left and took refuge with her uncle, Bishop Eckbert of Bamberg. No longer caring for position or wealth, she joined the Third Order of St. Francis, a lay Franciscan group. At Marburg she built a hospice for the poor and sick, to whose service she devoted the rest of her life. She put herself under the spiritual direction of Konrad von Marburg, an ascetic of incredible harshness and severity, who belonged to no specific order.

Among the best-known legends about Elizabeth is the one often depicted in art showing her meeting her husband unexpectedly on one of her charitable errands; the loaves of bread she was carrying were miraculously changed into roses. This transformation convinced him of the worthiness of her kind endeavours, about which he had been chiding her.

Elizabeth OF PORTUGAL, SAINT, byname *THE PEACEMAKER, OF THE HOLY QUEEN*, Portuguese *Santa Isabel de Portugal*, or *A Pacificadora*, or *A Rainha Santa* (b. c. 1271—d. July 4, 1336, Estremoz, Port.; canonized 1625; feast day July 4), daughter of Peter III of Aragon, wife of King Dinis (Dinis) of Portugal.

She was named for her great-aunt St. Elizabeth of Hungary and received a strict and pious education. In 1282 she was married to Dinis, a good ruler but an unfaithful husband. Despite the corrupt court life, Elizabeth maintained her devout habits, helped the sick and the poor, and founded charitable establishments. When her son Afonso rebelled against his father, Elizabeth rode between the two armies and reconciled father and son. She also helped settle disputes among other royal relatives. After Dinis died in 1325, she lived at Coimbra, Port., near a Poor Clare convent that she had founded, and devoted herself to people in need. She died on her way to the battlefield to make peace between her son, then King Afonso IV, and Alfonso XI of Castile.

Elizabeth STUART (b. Aug. 19, 1596, Falkland Palace, Fifeshire, Scot.—d. Feb. 13, 1662, Westminster, London, Eng.), British princess who from 1619 was titular queen of Bohemia.

The daughter of James VI of Scotland (later James I of Great Britain) and Anne of Denmark, Elizabeth in 1606 came to the British royal court, where her beauty and charm attracted much attention and where she soon became a favourite subject of the poets. Gustavus Adolphus of Sweden, Philip III of Spain, and Frederick V, the Elector Palatine, all sought her hand. Her mother actively favoured the Spanish match, but her father, hoping to strengthen his ties with the German Protestant rulers, chose Frederick. After the wedding (February 1613), the couple left for Heidelberg. Their first child, Frederick Henry, was born in January 1614; their most famous son, Prince Rupert (*q.v.*), was born in December 1619.

In 1619 the Bohemians, in defiance of their Habsburg king Ferdinand, offered the crown of Bohemia to Frederick. In November 1619 he was crowned king (as Frederick I), but in November 1620 the Bohemian forces were defeated by the Catholic League acting for Ferdinand (then Holy Roman emperor). Elizabeth and Frederick fled, ultimately finding refuge at The Hague with Prince Maurice of Orange.

Elizabeth spent the ensuing 40 years in exile. Her eldest son died in 1629 and her husband in 1632. When in 1648 her second son, Charles Louis, was restored to the Palatinate, he ignored her pleas to join him, and in 1650 a pension from the House of Orange ceased. Help from England stopped owing to the English Civil Wars (1642–51) between supporters of Elizabeth's brother, King Charles I, and the Parliamentarians. In 1661 her nephew Charles II grudgingly allowed her to return to England.

Elizabeth's letters were published in 1953, edited by L.M. Baker.

Elizabeth City, city, seat (1799) of Pasquotank county, northeastern North Carolina, U.S. It lies on the Pasquotank River, at the southern end of Dismal Swamp Canal on the Atlantic Intracoastal Waterway. It was founded and incorporated as Redding in 1793 but was renamed probably for Elizabeth, wife of Adam Tooley, the original landholder. Its excellent harbour was developed after the canal (completed 1828) stimulated trade with the West Indies. A port of entry, it ships local products and has lumberyards, shipyards, textile mills, and diversified industries. Elizabeth City State University was founded in 1891 and College of the Albemarle in 1960. Nearby are U.S. Coast Guard installations; Kitty Hawk, near where the Wright brothers made their first flight, in 1903; and the Outer Banks, on the Atlantic Flyway, a rendezvous for wildfowl hunters and fishermen. The International Cup Regatta and the Rockfish Rodeo are annual fall events. Halls Creek, near the city, was the site of the first Grand Assembly of Carolina (1665), and Enfield Farm was the scene of

Culpeper's Rebellion (1677–79). Pop. (1992 est.) 14,753.

Elizabeth Islands, chain of small islands extending southwest for 16 miles (26 km) from the southwestern tip of Cape Cod, southeastern Massachusetts, U.S., between Buzzards Bay and Vineyard Sound. Administratively a part of Dukes county, the islands constitute Gosnold town (a township area settled in 1641 and incorporated in 1864) and include Naushon, Pasque, Nashawena, and Cuttyhunk. The islands were visited in 1602 by the English navigator Bartholomew Gosnold, who built a fort and established a short-lived (three-week) colony on Cuttyhunk (the westernmost island) 18 years before the arrival of the *Mayflower* pilgrims at Plymouth. The name Cuttyhunk may be a distortion of a Wampanoag Indian term meaning "a thing that lies out in the great water." Naushon, the largest island, was a British naval base during the War of 1812.

The islands are low-lying, cover an area of about 14 square miles (36 square km), are mostly privately owned, and may be reached only by boat and charter aircraft. Cuttyhunk is a popular base for sportfishing. Pop. (1992 est.) 98.

Elizabethan literature, body of works written during the reign of Elizabeth I of England (1558–1603), probably the most splendid age in the history of English literature, during which such writers as Sir Philip Sidney, Edmund Spenser, Roger Ascham, Richard Hooker, Christopher Marlowe, and William Shakespeare flourished. The epithet Elizabethan is merely a chronological reference and does not describe any special characteristic of the writing.

The Elizabethan age saw the flowering of poetry (the sonnet, the Spenserian stanza, dramatic blank verse), was a golden age of drama (especially for the plays of Shakespeare), and inspired a wide variety of splendid prose (from historical chronicles, versions of the Holy Scriptures, pamphlets, and literary criticism to the first English novels). From about the beginning of the 17th century a sudden darkening of tone became noticeable in most forms of literary expression, especially in drama, and the change more or less coincided with the death of Elizabeth. English literature from 1603 to 1625 is properly called Jacobean, after the new monarch, James I. But, insofar as 16th-century themes and patterns were carried over into the 17th century, the writing from the earlier part of his reign, at least, is sometimes referred to by the amalgam "Jacobethan."

Elizabethton, city, seat (1796) of Carter county, northeastern Tennessee, U.S., at the confluence of the Doe and Watauga rivers, in the southern Appalachian Mountains and the Unaka Division of the Cherokee National Forest, just east of Johnson City. Situated in Happy Valley, it is one of the region's oldest settlements, where a compact for self-government (the Watauga Association) was made in 1772. The community was named for Elizabeth (wife of Landon Carter, an early settler, for whom the county was named). From nearby Sycamore Shoals (now a state historic area), Revolutionary War patriots marched to the Battle of Kings Mountain (1780) in South Carolina. President Andrew Johnson died at Stover House, on the banks of the Watauga.

The city's varied manufactures include synthetic yarns, twine, clothing, corrugated boxes, piano strings, and furniture. Milligan College (founded 1866) is 5 miles (8 km) east. Nearby Watauga and Boone lakes are impounded by Tennessee Valley Authority dams and provide recreational facilities. Inc. 1905. Pop. (1992 est.) 11,945.

Elizabethtown, city, Hardin county seat, central Kentucky, U.S., 48 miles (77 km) south

of Louisville. Settled as Severns Valley Station (1779–80), it was laid out in 1793 by Colonel Andrew Hynes and named for his wife when it was officially established in 1797. Abraham Lincoln's father, Thomas, lived for a time in Elizabethtown in the early 1800s. The Abraham Lincoln Birthplace National Historic Site is 13 miles (21 km) southeast of the city. During the American Civil War the town was bombarded by the forces of the Confederate general John Morgan.

Elizabethtown developed as a trading centre for agricultural produce, tobacco, and spirits and after World War II acquired diversified industry. The Elizabethtown Community College, a branch of the state university, was opened in 1964. My Old Kentucky Home State Shrine, the Patton (Armor) Museum, and Fort Knox with its gold vaults are in the vicinity. Inc. city, 1893. Pop. (2000) 22,542.

Elizaveta (Russian personal name): *see under* Elizabeth.

Elizavetgrad (city, Ukraine): *see* Kirovograd.

elk, in Europe, a member of *Alces alces*, large-hoofed mammals known in North America as the moose (*q.v.*). The name is also used for several large deer of the genus *Cervus*, notably the red deer of Europe, the Kashmir stag and the Himalayan shou, as well as the North American deer more correctly called wapiti (*q.v.*). The name is also applied to the extinct Irish elk (*q.v.*).

elk, American: *see* wapiti.

Elk City, city, Beckham county, western Oklahoma, U.S., on Elk Creek. Laid out in 1901, the town was called Busch. It is now the service centre for an agricultural, oil, and livestock area and has industries that include oil refining, gas recycling, cotton-gin equipment, furniture manufacturing, and feed production. The Sandstone Creek Project, for upstream flood control of the Washita River, is 5 miles (8 km) northwest, and Red Moon Indian Reservation, Washita National Wildlife Refuge, and Foss Reservoir State Park are nearby. Pop. (2000) 10,510.

Elk Hills Scandal (U.S. history): *see* Teapot Dome Scandal.

Elk Island National Park, park in central Alberta, Canada, 20 miles (32 km) east of Edmonton. Established in 1906 as a game preserve, it is one of Canada's smaller national parks, with an area of 75 square miles (194 square km). The park is mostly forested but has facilities for prairie grazing. Tawayik Lake and its numerous islands form the chief resort area. The park protects a large herd of buffalo, as well as wapiti, deer, and moose.

Elk Mountains, segment of the southern Rockies, extending for 50 miles (80 km) through Pitkin and Gunnison counties, west-central Colorado, U.S. Several peaks surpass 14,000 feet (4,300 m), including Pyramid, Snowmass, Capitol, and Maroon peaks, with Mount Carbon (14,259 feet [4,346 m]) being the highest. Mount Gunnison (12,714 feet [3,875 m]) is the high point in the West Elk Mountains, a southwesterly extension. Embraced by the Gunnison and White River national forests, the mountains are noted for their mineral deposits and recreational appeal.

Elk River, river rising as Bradley Creek in the Cumberland Mountains. Grundy county, southern Tennessee, U.S. The river meanders approximately 200 miles (320 km) southwestward through Franklin and Lincoln counties, past Fayetteville, across the southeastern corner of Giles county, and into Alabama. There it enters the Tennessee River 6 miles (10 km) east of Wheeler Dam, where it forms part of Wheeler Reservoir.

Elkesaite, also spelled ELKASAITA, member of a Jewish sect that arose in the vicinity of

Trans-Jordanic Palestine around 100 AD. The sect was most noted for its practice of ritual baptism. Named after either a visionary leader named Elkesai or the book of revelation that bore his name, the group followed most Jewish laws, believed in the power of total-immersion baptism to remit sins, and may have practiced a form of communion with bread and salt.

Elkesaism drew followers from the Essene sect of Judaism and from among the Aramaic Jewish-Christians in the region of the Dead Sea. In later years, by 220 AD, the group adopted a Christological doctrine, apparently in an attempt to attract Greek-speaking Christians, but had virtually died out by 400 AD.

Elkhart, city, Elkhart county, northern Indiana, U.S. It lies at the confluence of the St. Joseph and Elkhart rivers, just west of South Bend. Elkhart was laid out in 1832 at the junction of Indian trails and derives its name from an island at the confluence of the rivers that was said by the Potawatami to resemble the shape of an elk's heart. The location there of railroad repair shops (*c.* 1870) stimulated development of the town, which also became a division point for the New York Central Railroad. The manufacture of brass cornets was begun there in 1875 by Charles G. Conn; his company, followed by others, has made Elkhart the band instrument centre of the country. The city's pharmaceutical industry was established by Dr. Franklin Miles in 1884. Other manufactures now include mobile homes and recreational vehicles. Inc. town 1858; city, 1875. Pop. (2000) city, 51,874; Elkhart-Goshen MSA, 182,791.

Elkhorn Tavern, Battle of (American Civil War): *see* Pca Ridge, Battle of.

Elkin, Stanley, in full STANLEY LAWRENCE ELKIN (b. May 11, 1930, New York, N.Y., U.S.—d. May 31, 1995, St. Louis, Mo.), American writer known for his extraordinary flights of language and imaginative tragicomic explorations of contemporary life.

Elkin grew up in a Jewish family in Chicago. He received a Ph.D. (1961) from the University of Illinois at Urbana-Champaign, completing a dissertation on William Faulkner. From 1960 until his death he taught at Washington University in St. Louis.

Elkin's first novel, *Boswell: A Modern Comedy* (1964), tells of an ordinary man who founds a club for famous individuals, hoping like his namesake to bask in reflected glory. *Criers and Kibitzers, Kibitzers and Criers* (1966), a collection of comic short stories on Jewish themes and characters, was well received. Elkin explored the rift between family ties and the lure of assimilation in *A Bad Man* (1967). *The Franchiser* (1976), considered one of Elkin's strongest works, tells of Ben Flech, an orphaned bachelor adopted as an adult into a family of 18 twins and triplets, all with rare and incurable diseases.

The Living End (1979) is perhaps Elkin's best-known work. Its three interwoven novels—about heaven, hell, and Minnesota's twin cities of Minneapolis and St. Paul—examine the mundane concerns of a liquor salesman, as well as God and the problem of evil. Other novels include *Stanley Elkin's The Magic Kingdom* (1985), *The MacGuffin* (1991), and *Mrs. Ted Bliss* (1995).

Elko, city, seat (1869) of Elko county, northeastern Nevada, U.S., in the Humboldt River valley. It originated in 1868 as a construction camp along the Central Pacific Railroad. Elko (a common railroad name of uncertain origin) developed as a transportation and communications centre. The present economy of the city is based on the raising of livestock (cattle and sheep), some mining (gold, silver, and copper), freight handling, and tourism. Northern Nevada Community College was estab-

lished there in 1967. Elko is surrounded by segments of Humboldt National Forest, which is headquartered in the city. Inc. 1917. Pop. (1990) 16,708.

Elkton, town, seat (1786) of Cecil county, northeastern Maryland, U.S., near the Delaware state line. It was patented as Friendship in 1681 but was later called Head of Elk (for its location at the head of the Elk River); its present name was established in 1787 when the town was incorporated. In August 1777, during the American Revolution, the British under General Sir William Howe landed on a promontory just southwest of Elkton prior to an attack on Philadelphia. A British naval squadron attacked the town during the War of 1812 but was repulsed.

Known as the "Gretna Green of the East," Elkton had a lucrative business in quick marriages until a 1938 state law stipulated a 48-hour waiting period; the town's wedding chapels are still popular for eloping couples. Elk Neck State Park is nearby. Pop. (2000) 11,893.

Ellenborough, Edward Law, Earl of, Viscount Southam of Southam, Baron Ellenborough of Ellenborough (b. Sept. 8, 1790, London, Eng.—d. Dec. 22, 1871, Southam Delabre, Gloucestershire), British governor-general of India (1842–44), who also served four times as president of the board of control for India and was first lord of the British Admiralty. He was recalled from India for being out of control and later resigned another office under pressure.

Earl of Ellenborough, detail of an oil painting by F.R. Say, c. 1845; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Educated at Eton and at St. John's College, Cambridge, he entered the House of Commons in 1813 and the House of Lords as a baron following his father's death in 1818. He served as lord privy seal in 1828 and was president of the board of control for India in 1828–30 and for brief periods in 1834–35 and 1841. In the latter year Ellenborough was appointed governor-general of India. He had opposed since 1839 the costly intervention in Afghanistan, and after the First Afghan War he decided to make the Indus River his frontier, retaining only those strong-points upon it which ensured free navigation. However, rash opportunism led him to acquiesce in actions of Sir Charles James Napier (*q.v.*), his governor in Sind, which drove the Sindhi emirs (rulers) into war and defeat (1843).

Ellenborough then pursued his plans to promote trade by ending tolls and duties throughout Sind, Bahawalpur, the North Western Provinces, Madras, and Bombay. But a war with Gwalior in December 1843, designed to keep its large army out of hostile hands, frustrated these plans, and the directors, exasperated by Ellenborough's arrogant self-will, resolved, in April 1844, to recall him. On his return he was created an earl and viscount.

Ellenborough served under Sir Robert Peel as first lord of the Admiralty in 1846 and under Lord Derby at the Board of Control in 1858. There he drafted the new plan for the government of India, which the Indian Mutiny had rendered necessary; but, by making public a caustic dispatch censuring Lord Canning's Oudh proclamation, which Ellenborough thought betrayed a desire for indiscriminate vengeance, he roused such opposition that he chose to resign. He never held office again.

Ellensburg, former **ROBBER'S ROOST**, city, seat (1883) of Kittitas county, central Washington, U.S., on the Yakima River, 28 miles (45 km) north of Yakima. The first white man settled there in 1867, and in 1870 the valley's first trading post was opened. In 1875 John Shoudy platted a townsite, naming it for his wife. Growth of the community was given impetus in 1887 by the building of the Northern Pacific Railway through to Puget Sound. Central Washington State College, opened there as a teacher college in 1891, provides a major source of employment. Ellensburg cherishes a Wild West tradition and is the site of the state's major rodeo (Labor Day weekend); the area is known for its dude ranches. Sheep and cattle are raised, and hay, small grain, and potatoes are grown on land irrigated through the Yakima Reclamation Project. Ginkgo Petrified Forest State Park (with numerous species of agatized wood and, at 7,184 acres [2,887 hectares], one of the world's largest petrified forests) is 28 miles (45 km) east. Inc. town, 1883; city, 1886. Pop. (1990) 12,361.

Ellerman, Annie Winifred (British writer): see Bryher.

Ellesmere, Lake, coastal lagoon, eastern South Island, New Zealand, just west of Banks Peninsula. It measures 14 by 8 miles (23 by 13 km) and is 70 square miles (180 square km) in area. Receiving runoff from a 745-square-mile (1,930-square-kilometre) basin through several streams, principal of which is the Selwyn (entering through a delta from the north), Lake Ellesmere is brackish and is no deeper than 7 feet (2 m). It is isolated from the Pacific by the Kaitorete Spit, a gravel formation created by materials eroded from the Canterbury Plain and carried north by shore currents. There is no natural channel through the spit, but, to prevent rising waters from inundating market-gardening areas on reclaimed sections of the swampy shore, an opening has been dug at Taumutu in the southwest. The lake is host to great flocks of waterfowl. Its Maori name, Waihora, means "wide waters."

Ellesmere, Thomas Egerton, Baron: see Brackley, Thomas Egerton, Viscount.

Ellesmere Island, largest island of the Queen Elizabeth Islands, Baffin region, Northwest Territories, Canada. Off the northwest coast of Greenland, the island is believed to have been visited by Vikings in the 10th century. It was seen in 1616 by the explorer William Baffin and was named in 1852 by Sir Edward A. Inglefield's Expedition (which navigated the coast in the *Isabel*) after Francis Egerton, 1st Earl of Ellesmere. The island, roughly 300 miles wide by 500 miles long (500 km wide by 800 km long) and covering an area of 75,767 square miles (196,236 square km), is the most rugged in the Canadian Arctic Archipelago, with towering mountains (up to 8,583 feet [2,616 m]), vast ice fields, and a deeply indented coastline. Cape Columbia, at 83°07' N, is the most northerly point of Canada. Settlements, all quite small, include Eureka, Craig Harbour, and Alert, the northernmost community in North America. Oil deposits have been discovered on the island.

Ellesmere Port and Neston, district (borough), county of Cheshire, England, extending from the River Mersey to the River Dee at the southern end of the Wirral Peninsula. Ellesmere Port is very much a 20th-century creation. The building of the Ellesmere Canal in 1795 saw the beginnings of industrial development, but it was the opening of the Manchester Ship Canal in 1894 that marked the emergence of Ellesmere Port as a major industrial centre. Petroleum refining began after World War I. After World War II, as refining and chemical industries expanded at Stanlow, the town grew rapidly. Other industries followed, including motor-vehicle manufacturing. In the west of the borough are the residential communities of Neston and Parkgate, the latter was an 18th-century port for ships from Ireland. The borough, covering 32 square miles (82 square km), also includes a number of villages. Pop. (1986 est.) 80,200.

Ellet, Charles (b. Jan. 1, 1810, Penn's Manor, Pa., U.S.—d. June 21, 1862, Cairo, Ill.), American engineer who built the first wire-cable suspension bridge in America.

After working for three years as a surveyor and assistant engineer, he studied at the Ecole des Ponts et Chaussées, Paris, and traveled in France, Switzerland, and Great Britain, studying engineering works. After he returned to the United States in 1832, he proposed to Congress a 1,000-foot (305-metre) suspension bridge over the Potomac River at Washington, D.C. Like several of his early projects, this plan was too advanced for its time and was generally discouraged. In 1842 Ellet completed his wire-cable suspension bridge over the Schuylkill River at Philadelphia. Supported by five wire cables on each side, the bridge had a span of 358 feet (109 m).

Ellet designed and built (1846-49) for the Baltimore & Ohio Railway the world's first long-span wire-cable suspension bridge over the Ohio River at Wheeling, Va. The central span of 1,010 feet (308 m) was then the longest ever built.

In 1847 Ellet contracted to build a bridge over the Niagara River, 2 miles (3 km) below the falls. A light suspension span was built as a service bridge, and over it Ellet became the first man to ride across the Niagara Gorge. A dispute over money led Ellet to resign in 1848, leaving the bridge uncompleted.

After the outbreak of the American Civil War, Ellet devised a steam-powered ram that played a role in winning domination of the Mississippi River by the Union. He personally led a fleet of nine rams in the Battle of Memphis on June 6, 1862. Union forces were victorious, but Ellet was mortally wounded.

Ellice Islands (Pacific Ocean): see Tuvalu.

Ellington, Duke, byname of EDWARD KENNEDY ELLINGTON (b. April 29, 1899, Washington, D.C.—d. May 24, 1974, New

founders of big-band jazz, which led to the swing era.

Ellington studied piano from age seven and in his teens was influenced by ragtime pianists; at 17 he began to play professionally. The following year he renounced the fine arts, toward which his parents had oriented him, to devote himself to jazz.

In about 1923, at the Kentucky Club in New York City, he led a small group that was later the core of his large band. In this period, the group contained Harry Carney, Sonny Greer, and, above all, Bubber Miley and Tricky Sam Nanton. Their tense or piercing sonorities constituted the essential element of the "jungle style" that asserted itself in pieces such as "Black and Tan Fantasy."

Almost without interruption from then until his death, Ellington led a band that was his laboratory for composition, orchestration, and the unique blend of improvisation and orchestration that he mastered with instrumentalists who spent most of their careers with him. He capitalized on the unique personal sounds of outstanding players such as trumpeter Cootie Williams, saxophonist Johnny Hodges, and bassist Jimmy Blanton, using each as a separate tone colour and writing ensemble parts suited to each player rather than writing just for the tone quality traditionally identified with the instrument. Especially characteristic of Ellington was the plunger-muted growl style of trombonist Nanton and trumpeter Miley. Ellington artfully employed wordless female vocals as another tone colour. Unlike his contemporaries, Ellington often broke away from the standard practice of grouping instruments of a kind and writing passages that pitted them against each other (e.g., saxophones versus brass). He instead drew instruments from different sections of the band and voiced them together as a unit, thereby generating rich and unusual sounds such as the well-known "Mood Indigo" voicing of bass clarinet, muted trumpet, and trombone.

More than 1,000 orchestrations were crafted by Ellington, including not only brief big-band pieces but ones for film scores, operas, ballets, Broadway shows, and church services, many involving symphony orchestra, choruses, and dancers. The Ellington tunes most frequently performed by others include "Satin Doll," "Sophisticated Lady," "Don't Get Around Much Anymore," "Do Nothin' Til You Hear from Me," and "In a Sentimental Mood." His best-known longer works include *Black, Brown, and Beige* and *Reminiscing in Tempo*. Some pieces associated with Ellington were written by his musicians: pianist-arranger Billy Strayhorn wrote "Take the 'A' Train" and "Lush Life"; trombonist Juan Tizol wrote "Perdido" and "Caravan."

As a pianist, Ellington drew from the East Coast stride style of James P. Johnson and Willie the Lion Smith, streamlining it into the swinging and sprightly embroidery style that he used as accompaniment for his improvising soloists and as an additional orchestral colour. The piano style influenced Thelonious Monk, a leading modern-jazz composer-pianist, while Ellington's arranging concepts were assimilated by Gil Evans, Thad Jones, George Russell, Clare Fischer, Charles Mingus, Sun Ra, and other significant modern composers. In part owing to the showcase Ellington provided for them, several of his musicians had strong impact on jazz styles for their particular instruments: Hodges' approach to alto saxophone ballad interpretation, Blanton's method of hornlike solo lines played pizzicato on bass, and Ben Webster's tenor saxophone approach.

It is generally agreed that Ellington's masterpieces include a group of lesser-known works done between 1939 and 1942, which show a remarkably compatible matching of improvisations and prewritten passages: "Harlem Air Shaft," "Jack the Bear," "Concerto for Cootie," "Ko-ko," and "Cotton Tail." *The World*

Ellington

York City), American composer, bandleader, and pianist who is among the most significant figures in jazz history and, along with Fletcher Henderson and Don Redman, was one of the

of Duke Ellington by Stanley Dance contains interviews with the bandleader and his musicians and was published in 1970. An autobiography, *Music Is My Mistress*, appeared in 1973, and a biography by Ellington's son Mercer, *Duke Ellington in Person*, was published in 1978. James Lincoln Collier's *Duke Ellington* appeared in 1987.

Elliot Lake, city, Algoma district, south-central Ontario, Canada. It lies along the Elliot and Horne lakes, midway between Sault Ste. Marie and Sudbury and about 15 miles (25 km) north of Lake Huron's North Channel. Established in 1954 as a planned community when uranium ore was discovered in the vicinity, Elliot Lake grew rapidly to serve one of the world's largest uranium-producing districts and is the site of a mining and nuclear museum. It is now also a base for summer and winter sports, hunting, and fishing. Inc. 1966. Pop. (1991) 14,089.

Elliot-Murray-Kynnmound, Gilbert: see Minto, Gilbert Elliot-Murray-Kynnmound, 1st Earl of; Minto, Gilbert John Elliot-Murray-Kynnmound, 4th Earl of.

Elliotson, John (b. Oct. 29, 1791, Southwark, London, Eng.—d. July 29, 1868, London), English physician who advocated the use of hypnosis in therapy and who in 1849 founded a mesmeric hospital. He was one

Elliotson, detail of a lithograph
sec Hulton Picture Library

of the first teachers in London to emphasize clinical lecturing and was one of the earliest of British physicians to urge use of the stethoscope.

After studying medicine at the University of Edinburgh, at the University of Cambridge, and in London hospitals, Elliotson taught at London University (now University College). In 1834 he became physician to the University College Hospital, where his interest in hypnosis led to conflicts with the hospital's medical committee and his resignation in 1838.

Elliott, Herb, byname of HERBERT JAMES ELLIOTT (b. Feb. 25, 1938, Perth, W.Aus., Australia), Australian middle-distance runner who was record holder in the 1,500-metre (metric-mile) race (1958–67) and the mile race (1958–62). As a senior runner he never lost a mile or a 1,500-metre race.

Elliott began running competitively at the age of eight. He ran his first sub-four-minute mile in 1958; and in that year he set a new world record for the mile of 3 min 54.5 s and for the 1,500-metre race of 3 min 36 s. Elliott ran the mile in less than 4 minutes 10 times in 1958 and 17 times during his career. In the 1960 Olympic Games at Rome, he won the gold medal in the 1,500-metre race, leading the second runner by 20 yards and setting a new record of 3 min 35.6 s. He retired from competition in 1962.

ellipse, a closed curve, the intersection of a right circular cone (see cone) and a plane that is not parallel to the base, the axis, or an element of the cone. It may be defined as the path of a point moving in a plane so that the ratio of its distances from a fixed point (the

focus) and a fixed straight line (the directrix) is a constant less than one. Any such path has this same property with respect to a second fixed point and a second fixed line, and ellipses often are regarded as having two foci and two directrices. The ratio of distances, called the eccentricity, is the discriminant ($q.v.$; of a general equation that represents all the conic sections [see conic section]). Another definition of an ellipse is that it is the locus of points for which the sum of their distances from two fixed points (the foci) is constant. The smaller the distance between the foci, the smaller is the eccentricity and the more closely the ellipse resembles a circle.

A straight line drawn through the foci and extended to the curve in either direction is the major diameter (or major axis) of the ellipse. Perpendicular to the major axis through the centre, at the point on the major axis equidistant from the foci, is the minor axis. A line drawn through either focus parallel to the minor axis is a latus rectum (literally, "straight side").

The ellipse is symmetrical about both its axes. The curve when rotated about either axis forms the surface called the ellipsoid ($q.v.$) of revolution, or a spheroid.

The path of a heavenly body moving around another in a closed orbit in accordance with Newton's gravitational law is an ellipse (see Kepler's laws of planetary motion). In the solar system one focus of such a path about the Sun is the Sun itself.

For an ellipse the centre of which is at the origin and the axes of which are coincident with the x and y axes, the equation is $x^2/a^2 + y^2/b^2 = 1$. The length of the major diameter is $2a$; the length of the minor diameter is $2b$. If c is taken as the distance from the origin to the focus, then $c^2 = a^2 - b^2$, and the foci of the curve may be located when the major and minor diameters are known. The problem of finding an exact expression for the perimeter of an ellipse led to the development of elliptic functions, an important topic in mathematics and physics.

ellipsoid, closed surface of which all plane sections are either ellipses or circles. An ellipsoid is symmetrical about three mutually perpendicular axes that intersect at the centre.

If a , b , and c are the principal semi-axes, the general equation of such an ellipsoid is $x^2/a^2 + y^2/b^2 + z^2/c^2 = 1$. A special case arises when $a = b = c$: then the surface is a sphere, and the intersection with any plane passing through it is a circle. If two axes are equal, say $a = b$, and different from the third, c , then the ellipsoid is an ellipsoid of revolution, or spheroid, the figure formed by revolving an ellipse ($q.v.$) about one of its axes. If a and b are greater than c , the spheroid is oblate; if less, the surface is a prolate spheroid.

An oblate spheroid is formed by revolving an ellipse about its major axis; a prolate, about its minor axis. In either case, intersections of the surface by planes parallel to the axis of revolution are ellipses, while intersections by planes perpendicular to that axis are circles.

Often an ellipsoid of revolution (called the reference ellipsoid) is used to represent the Earth in geodetic calculations, because such calculations are simpler than those with more complicated mathematical models. For this el-

Ellipsoid

lipoid, the difference between the equatorial radius and the polar radius (the semimajor and semiminor axes, respectively) is about 21 km (13 miles) and the flattening is about 1 part in 300.

elliptic equation, any of a class of partial differential equations describing phenomena that do not change from moment to moment, as when a flow of heat or fluid takes place within a medium with no accumulations. The Laplace equation, $u_{xx} + u_{yy} = 0$, is the simplest such equation describing this condition in two dimensions. In addition to satisfying a differential equation within the region, the elliptic equation is also determined by its values (boundary values) along the boundary of the region, which represents the effect from outside the region. These conditions can be either those of a fixed temperature distribution at points of the boundary (Dirichlet problem) or those in which heat is being supplied or removed across the boundary in such a way as to maintain a constant temperature distribution throughout (Neumann problem).

If the highest-order terms of a second-order partial differential equation with constant coefficients are linear and if the coefficients a , b , c of the u_{xx} , u_{yy} , u_{xy} terms satisfy the inequality $b^2 - 4ac < 0$, then, by a change of coordinates, the principal part (highest-order terms) can be written as the Laplacian $u_{xx} + u_{yy}$. Because the properties of a physical system are independent of the coordinate system used to formulate the problem, it is expected that the properties of the solutions of these elliptic equations should be similar to the properties of the solutions of Laplace's equation (see harmonic function). If the coefficients a , b , c are not constant, but depend on x and y , then the equation is called elliptic in a given region if $b^2 - 4ac < 0$ at all points in the region. The functions $x^2 - y^2$ and $e^x \cos y$ satisfy the Laplace equation, but the solutions to this equation are usually more complicated because of the boundary conditions that must be satisfied as well.

elliptic geometry: see Riemannian geometry.

Ellis, Havelock, in full HENRY HAVELOCK ELLIS (b. Feb. 2, 1859, Croydon, Surrey, Eng.—d. July 8, 1939, Washbrook, Suffolk), English essayist and physician who studied human sexual behaviour and challenged Victorian taboos against public discussion of the subject.

Ellis was the son of a sea captain, and he was educated at private schools in South London. After spending four years in Australia as a teacher, he returned to England in 1879 and entered St. Thomas' Hospital, London, in 1881 to study medicine. Ellis met George Bernard Shaw and Arthur Symonds at meetings of the Fellowship of the New Life and became editor in 1887 of the "Mermaid Series of Old Dramatists," designed to bring 17th-century dramas to a wider public. He also proposed and edited the "Contemporary Science Series," which included his first book, *The Criminal* (1890). The researches begun for *Man and Woman* (1894) led to his major work, the seven-volume *Studies in the Psychology of Sex* (1897–1928). Publication of the first volume resulted in a trial during which the judge hearing the case called claims for the book's scientific value "a pretence, adopted for the purpose of selling a filthy publication." Other volumes of the work were published in the United States and until 1935 were legally available only to the medical profession.

Ellis' *Studies in the Psychology of Sex* is a comprehensive and groundbreaking encyclopaedia of human sexual biology, behaviour, and attitudes. In separate volumes he examined such topics as homosexuality, masturba-

tion, and the physiology of sexual behaviour. Ellis viewed sexual activity as the healthy and natural expression of love, and he sought to

Havelock Ellis
The Mansell Collection

dissipate the fear and ignorance that characterized many people's attitudes toward human sexuality. His work helped to foster the open discussion of sexual problems, and he became known as a champion of women's rights and of sex education.

Ellis Island, island in Upper New York Bay that formerly was the United States' principal immigration reception centre. The island lies about 1 mile (1.6 km) southwest of Manhattan Island, New York City, and about 1,300 feet (400 m) east of the New Jersey shore. It has an area of about 27 acres (11 hectares).

Interior of Registry Room, Ellis Island, Statue of Liberty National Monument, Upper New York Bay
Randy Duncan—Corbis

The island was named for Manhattan merchant Samuel Ellis, who owned it in the 1770s. For a time, ships' ballast was dumped there, and much of the island's current area consists of landfill. In 1808 the state of New York sold the island to the federal government, and it was used as a fort and powder magazine. It served as the nation's major immigration station from 1892 to 1924, after which its role was reduced; during that period an estimated 17 million immigrants passed through Ellis Island, where they were processed by immigration authorities and obtained permission to enter the United States. After immigration reception was moved to New York City proper in 1943, Ellis Island continued to serve as a detention station for aliens and deportees until 1954. It became part of Statue of Liberty National Monument (along with nearby Liberty Island) in 1965 and was reopened to sightseers in 1976 by the National Park Service. The Main Building and other structures on the island were restored in the 1980s and opened in 1990 as the Ellis Island Immigration Museum.

The jurisdiction of the island, which lies in New Jersey waters but traditionally has been

considered a part of New York City, became the source of a long-running dispute between New Jersey and New York. An agreement between the two states in 1834 gave sovereignty of what was then a 3.3-acre (1.3-hectare) island to New York. In 1998 the U.S. Supreme Court allowed New York to retain this area but awarded sovereignty of the remainder of the island to New Jersey.

Ellison, Ralph (Waldo) (b. March 1, 1914, Oklahoma City, Okla., U.S.—d. April 16, 1994, New York, N.Y.), American teacher and writer who won eminence with his first and only novel, *Invisible Man* (1952).

Ellison left Tuskegee Institute (Alabama) in 1936 after three years' study of music and joined the Federal Writers' Project in New York City. In 1939 he began contributing short stories, reviews, and essays to various periodicals. Following service in World War II, he produced *Invisible Man*, which won the 1953 National Book Award for fiction. The story tells of a naive and idealistic Southern black youth who goes to Harlem, joins the fight against white oppression, and ends up ignored by his fellow blacks as well as by whites. After his novel appeared, Ellison published only two collections of essays, *Shadow and Act* (1964) and *Going to the Territory* (1986). He lectured widely on black culture, folklore, and creative writing and taught at various American colleges and universities. He left a second novel unfinished at his death.

Ellmann, Richard (David) (b. March 15, 1918, Highland Park, Mich., U.S.—d. May 13, 1987, Oxford, Oxfordshire, Eng.), American literary critic and scholar, an expert on the life and works of James Joyce, William Butler Yeats, Oscar Wilde, and other modern British and Irish writers.

Ellmann graduated from Yale University (Ph.D., 1947) and taught at Northwestern University, Evanston, Ill., from 1951 to 1968, at Yale from 1968 to 1970, and at the University of Oxford from 1970 to 1984. His book *Yeats: The Man and the Masks* (1948; reprinted 1987) is a study of one of Yeats's intense conflicts, the dichotomy between the self of everyday life and the self of fantasy. The book revealed Yeats as a timid and confused man behind a facade of arrogance. Ellmann's definitive biography of *James Joyce* (1959; new and rev. ed., 1982) explored in detail aspects of Joyce's life and thought. His later works include *The Artist as Critic: Critical Writings of Oscar Wilde* and, as editor, *Oscar Wilde: A Collection of Critical Essays* (1970) and *New Oxford Book of American Verse* (1976). Ellmann's biography of *Oscar Wilde* appeared posthumously in 1988.

Ellora Caves, series of magnificent rock-cut temples of the Gupta Period (c. AD 320–540), near the village of Ellora, central Mahārāshtra state, western India, 18 miles (29 km) north-east of Aurangābād town. The temples are excavated out of rock cliffs overlooking a plain and are of Buddhist, Hindu, and Jaina origins. The most remarkable of the monuments is the monolithic Kailāsa Temple, 165 feet (50 m) long and 96 feet (29 m) high, cut from a single outcropping of rock. It is extensively carved with exceptionally vigorous sculptures of Hindu divinities and mythological figures, many in erotic and voluptuous poses. The temple, dedicated to the Hindu god Śiva (Shiva), was built in the 8th century during the reign of the Rāshtrakūtas. Ellora attracts many thousands of tourists annually.

Ellsworth, Lincoln, original name WILLIAM LINN ELLSWORTH (b. May 12, 1880, Chicago, Ill., U.S.—d. May 26, 1951, New York, N.Y.), American explorer, engineer, and scientist who led the first trans-Arctic (1926) and trans-Antarctic (1935) air crossings.

A wealthy adventurer, Ellsworth was a surveyor and engineer in Canada for five years

(1903–08), worked for three years with the U.S. Biological Survey, and served in the U.S. Army in World War I, training as an aviator. In 1924 he led the Johns Hopkins University (Baltimore, Md.) trans-Andean topographic survey from the Amazon River basin to the Pacific shores of Peru.

Fascinated with polar air exploration, he financed and accompanied two such expeditions with the Norwegian explorer Roald Amundsen. On the first (1925) they reached latitude 87°44' N in two amphibian planes; an emergency landing without radio caused them to be given up for lost. After 30 days of grim effort, they carved out a takeoff field on the rough polar ice pack, after which one plane, overloaded with the total party of six, returned to Spitsbergen (now Svalbard), off northern Norway. The following year Ellsworth and the Italian explorer Umberto Nobile made the first crossing of the North Polar Basin in the dirigible *Norge*—a 3,393-mile (5,463-kilometre)

Lincoln Ellsworth
By courtesy of the American Geographical Society

journey from Spitsbergen to Alaska that won worldwide acclaim. In 1931 Ellsworth made an 800-mile (1,300-kilometre) canoe trip through central Labrador and later that year made flights over Franz Josef Land and Novaya Zemlya—Arctic islands north of Russia.

In 1935, on the third of four private expeditions to the Antarctic, he and Canadian pilot Herbert Hollick-Kenyon flew across the continent from the Antarctic Peninsula to the Little America base on Ross Ice Shelf; they completed the journey on foot after running out of fuel. The area they covered, including the Sentinel Range of the Ellsworth Mountains, is now named Ellsworth Land and Marie Byrd Land. In 1939 he again flew over Antarctica and named the American Highland in the Indian Ocean quadrant.

Ellsworth, Oliver (b. April 29, 1745, Windsor, Conn. [U.S.]—d. Nov. 26, 1807, Windsor), American statesman and jurist, chief author of the 1789 act establishing the U.S. federal court system. He was the third chief justice of the United States.

Ellsworth attended Yale and the College of New Jersey (now Princeton), graduating from the latter in 1766. After pursuing theological and legal studies, he was admitted to the bar in Hartford, which he represented in the Connecticut General Assembly. He was subsequently state's attorney for Hartford county (1777), a member of the Continental Congress (1777–83) and of the Governor's Council of Connecticut (1780–85), and a judge on the state superior court (1785–89).

In 1787 Ellsworth, together with Roger Sherman and William Samuel Johnson, represented Connecticut at the Constitutional Convention in Philadelphia, serving as a member of the important committee on detail. At the convention, he proposed with Sherman the decisive "Connecticut compromise," by which the federal legislature was made to consist of two houses, the upper having equal representation from each state, the lower being chosen on the basis of population. This bargain is a keystone of the U.S. federal system.

To secure Southern support for the Constitution, Ellsworth supported free international trade in slaves. He also vigorously defended the Constitution at the Connecticut ratifying

Oliver Ellsworth, oil painting on wood by John Trumbull, 1792; in the Yale University Art Gallery
By courtesy of the Yale University Art Gallery

convention. His *Letters to a Landholder* had a broad influence during the ratification debates, much as the Federalist papers did in New York.

In 1789 Ellsworth became one of Connecticut's first U.S. senators and the acknowledged Federalist leader in the U.S. Senate. He reported the first Senate rules and suggested a plan for printing the journals, shaped the conference report on the Bill of Rights, framed the measure of admission for North Carolina, helped devise the government of the territory south of the Ohio River, and drafted the first bill regulating the consular service. He was chairman of the committee to establish the federal court system and the chief author of the Federal Judiciary Act of 1789, the principal basis ever since of the U.S. court structure.

In 1796 George Washington appointed him chief justice of the Supreme Court of the United States. Ellsworth's service on the high court was cut short in 1800 by ill health. In the 1790s Supreme Court justices also served in the circuit courts, and some of Ellsworth's most important decisions were given on circuit. His most controversial opinion was *United States v. Isaac Williams* (1799), which applied in the United States the common-law rule that a citizen may not expatriate himself without the consent of his government.

In 1799 he accepted President John Adams's request to join William Vans Murray and William R. Davie as commissioners to France to negotiate a new treaty. In October 1800 Ellsworth persuaded Napoleon to accept a compromise convention that provided for freedom of commerce between the two nations and in effect concluded the undeclared war between the United States and France.

From France he sent his resignation as chief justice. Until his death in 1807, he lived in Windsor, Connecticut. Though his career included few acts of genius and little public acclaim, Ellsworth's political skill, balanced judgment, and clarity of purpose entitle him to recognition as a founder of the highest stature. (J.F.K.)

Ellsworth Land, formerly ELLSWORTH HIGHLAND, region in Antarctica at the base of the Antarctic Peninsula, between the Ronne Ice Shelf and the Bellingshausen Sea, east of Marie Byrd Land. It embraces several mountain ranges, including the Ellsworth Mountains, the tallest peak of which, Vinson Massif (16,066 feet [4,897 m] above sea level), is the highest in Antarctica. The rugged, ice-covered area was discovered in 1935 by the American explorer Lincoln Ellsworth and his pilot Herbert Hollick-Kenyon during their aerial crossing of the continent and was named for the explorer's father. Claimed in part by Argenti-

na, Chile, and the United Kingdom, Ellsworth Land is still largely unexplored.

Ellul, Jacques (César) (b. Jan. 6, 1912, Bordeaux, France—d. May 19, 1994, Bordeaux), French political and social scientist, theologian, and philosopher of technology, known for his antitechnological views, as expressed in his masterwork *La Technique: ou, L'enjeu du siècle* (1954; *The Technological Society*).

Ellul lectured at the universities of Montpellier (1937–38) and Strasbourg (1938–40) before joining the Resistance during World War II. From 1944 to 1947 he was deputy mayor of Bordeaux. He was a professor of the history of law (1946–80) at the University of Bordeaux and professor of social history (1947–80) at the affiliated Institute of Political Studies.

Ellul's early works include *Le Fondement théologique du droit* (1946; *The Theological Foundation of Law*) and *Présence au monde moderne* (1948; *The Presence of the Kingdom*). The books for which he is best known, however, are *La Technique, Propagandes* (1962; *Propaganda; The Formation of Men's Attitudes*), and *L'illusion politique* (1964; *The Political Illusion*), all of which warn the reader of the dangers of human loss of control over the state, technology, and the modern world.

elm (genus *Ulmus*), any of about 18 species of forest and ornamental shade trees of the family Ulmaceae native primarily to North Temperate areas. Many are cultivated for their height and attractive foliage. Elm leaves are doubly toothed and often lopsided at the base. The petalless flowers appear before the leaves and are borne in clusters on jointed stems. The

American elm (*Ulmus americana*)
Russ Kinne—Photo Researchers

nutlike fruit, surrounded by a flat, sometimes hairy, winglike structure, is called a samara.

The American elm (*U. americana*), of eastern North America, may grow 24 to 30 m (about 80 to 100 feet) tall. It has dark gray, ridged bark and elliptical leaves. Slippery, or red, elm (*U. rubra*), a shorter species with a similar but smaller distribution, has a glue-like substance in the inner bark, which was formerly steeped in water as a remedy for throat ailments, powdered for use in poultices, and chewed as a thirst-quencher. Rock, or cork, elm (*U. thomasi*) has hard wood and twigs that often develop corky ridges.

Introduced species planted as ornamentals include Chinese elm (*U. parvifolia*), a small-leaved species with interesting mottled bark; English elm (*U. procera*), with a compact crown and deeply fissured bark; Wych elm (*U. glabra*), with smoother bark; and Camperdown elm (*U. glabra camperdownii*), a variety of Wych elm also known as umbrella elm because of its drooping branches. The fast-growing Siberian elm (*U. pumila*), a brittle-twiggd, weak-wooded tree, is sometimes planted for quick shade and for windbreaks.

Many elm species are susceptible to Dutch elm disease (a fungoid disease) and to elm phloem necrosis. Resistant strains are pre-

ferred for planting. Elm wood is important for boats and farm buildings because it is durable under water; it also is used for furniture.

elm bark beetle, any of several species of insect pests in the family Scolytidae (order Coleoptera). See bark beetle.

Elman, Mischa (b. Jan. 20, 1891, Talnoye, Ukraine, Russian Empire [now Tal'ne, Ukraine]—d. April 5, 1967, New York, N.Y., U.S.), violin virtuoso in the Romantic tradition, one of the foremost violinists of the 20th century.

A celebrated child prodigy, Elman studied violin from age four. In 1902 he became a tuition-free pupil of the famed violinist and teacher Leopold Auer at the St. Petersburg Conservatory. His professional debut in 1904 in Berlin quickly established him as one of the leading European violinists. From 1908 he toured the United States frequently. Subsequent tours took him throughout Europe and to East Asia. A U.S. citizen from 1923, he celebrated the 50th anniversary of his debut in the United States with a concert at Carnegie Hall in New York City. Elman composed several short violin pieces and arranged works by other composers for violin and piano.

Elmbridge, district and borough, administrative and historic county of Surrey, Eng. The borough comprises the former urban districts of Esher and of Walton and Weybridge. At the southwestern edge of Greater London, the district is largely residential. It includes the Sandown Park racecourse (1875) and Claremont Park, rebuilt by Lancelot ("Capability") Brown in the Palladian style for Robert Clive of India. There is some light engineering and a large aircraft works. Area 37 square miles (97 square km). Pop. (2001) 121,936.

Elmen, Gustav Waldemar (b. Dec. 22, 1876, Stockholm, Sweden—d. Dec. 10, 1957, Englewood, N.J., U.S.), American electrical engineer and metallurgist, who developed permalloys, metallic alloys with a high magnetic permeability. This property enables the alloy to be easily magnetized and demagnetized, and such alloys are important for use in electrical equipment.

Elmen, who immigrated to the United States in 1893, worked as an electrical engineer with General Electric (1904–06), Western Electric (1906–25), and Bell Telephone Laboratories, Inc. (1925–41). He founded and directed (1941–56) the magnetism laboratory of the Naval Ordnance Laboratory, Washington, D.C. About 1920 the importance of his newly discovered permalloys (iron-nickel and iron-cobalt alloys) for telephone and other communications systems was recognized. His discovery made possible deep-sea telegraph cables of large message-carrying capacity.

Elmhurst, city, Du Page county, western suburb of Chicago, northeastern Illinois, U.S. First settled in 1837, it was originally called Cottage Hill for the Hill Cottage, an inn built in 1843 midway between Chicago and the Fox Valley settlement. In 1869 it was renamed Elmhurst (compound of "elm" and the German cognate of "forest"). The population increased when the Chicago and North Western Railway arrived (1849), and German laborers were brought in to saw logs from nearby groves for the wood-burning engines. Elmhurst developed as a residential suburb of Chicago and has some light manufacturing. Elmhurst College, affiliated with the United Church of Christ, was founded in 1871. The city's Lizzadro Museum of Lapidary Art displays gems, minerals, and art objects. Inc. village, 1881; city, 1910. Pop. (2004 est.) 44,352.

Elmira, city, seat (1836) of Chemung county, southern New York, U.S., on the Chemung

River, near the Pennsylvania border, 60 mi (97 km) west of Binghamton. The first white settlement (1788) was incorporated as the village of Newtown in 1815. Renamed Elmira

Mark Twain's study, Elmira College campus, Elmira, N.Y.

Milt and Joan Mann from CameraMann

in 1828 for the daughter of an early settler, Nathan Teall, it grew after the completion in 1832 of the Chemung Canal to Seneca Lake (15 mi north) and developed industrially after the arrival of the Erie Railroad in 1849. Manufactures now include machine tools, valves, office machines, glass, fire-fighting equipment, automobile and aircraft parts, fabricated steel, and electronic tubes.

The city's Woodlawn National Cemetery contains the graves of nearly 3,000 Confederate prisoners who died in the Elmira prison camp. Elmira Reformatory (now Correctional Facility) was opened in 1876; it has been a trendsetter in prison reform. Mark Twain spent summers at nearby Quarry Farm from 1870 until his death and did much of his writing there; he is buried in the Woodlawn Cemetery along with his son-in-law, pianist-conductor Ossip Gabrilowitsch. Elmira College, founded in 1855, and one of the earliest institutions of higher learning for women in the U.S., was opened to men in 1969; Mark Twain's Study, fashioned in the style of a Mississippi riverboat pilothouse, is preserved on its campus. Since 1930 nearby Harris Hill (859 ft [262 m] above the valley floor) has been the scene of glider contests and is the site of the National Soaring Museum. The Arnot Art Museum is in the city as is the Elmira Business Institute.

The Battle of Newtown (Aug. 29, 1779), at which Gen. John Sullivan defeated a combined British and Indian force led by Sir John Johnson and Chief Joseph Brant, was fought 5 mi (8 km) southeast. More than 5,000 homes were destroyed when floodwaters ravaged the area in June 1972. Inc. city, 1864. Pop. (1990) city, 33,724; Elmira MSA, 95,195.

Elmira system, American penal system named after Elmira Reformatory, in New York. In 1876 Zebulon R. Brockway became an innovator in the reformatory movement by establishing Elmira Reformatory for young felons. Brockway was much influenced by the mark system, developed in Australia by Alexander Maconochie, whereby credits, or marks, were awarded for good behaviour, a certain number of marks being required for release. To this system Brockway added a new regimen of moral, physical, and vocational training. The Elmira system classified and separated various types of prisoners, gave them individualized treatment emphasizing vocational training and industrial employment, used indeterminate sentences, rewarded good behaviour, and paroled inmates under supervision.

Elmira Reformatory gave the reformatory movement two important philosophical tenets: first, the importance of specialized care for youthful offenders, recognizing both the individuality of prisoners and their similarity;

second, the recognition that up to a certain age every criminal ought to be regarded as potentially a good citizen. This reformatory ideology gradually entered the U.S. prison system and also affected European correctional practices. *See also* mark system.

Elmo, SAINT: *see* Erasmus, Saint.

Elmore, Francis Edward and Alexander Stanley (respectively b. Nov. 9, 1864, Liverpool—d. July 26, 1932, Boxmoor, Hertfordshire, Eng.; b. Jan. 1, 1867, Liverpool—d. March 4, 1944, Boxmoor), British technologists, joint developers of flotation processes by which valuable ore, such as that of copper, is separated from the worthless material (gangue) with which it is usually extracted from the Earth.

In their early days the brothers, with their father, were engaged in the electrolytic refining of copper and in the production of copper tubes. The "bulk oil process," the first flotation process commercially employed, was invented by Francis, patented in 1898, and brought into use by his brother. In this process the ore was ground, suspended in water, and brought in contact with oil. As the oil floated up through the slurry, it wetted the particles of the mineral in preference to those of the gangue and carried them out of the mixture. Subsequently, the brothers developed an improved process (Elmore vacuum process) that required less oil and became widely used in the concentration of low-grade ores during the 20th century.

Elmslie, George Grant (b. Feb. 20, 1871, Huntly, Aberdeen, Scot.—d. April 23, 1952, Chicago), architect whose importance in the Prairie school of U.S. architecture in the first two decades of the 20th century was second only to that of Frank Lloyd Wright.

Elmslie was apprenticed to Adler and Sullivan during Wright's tenure with that Chicago firm and was associated with Louis Sullivan as a designer from 1895 to 1910. He may have had considerable influence on the design of Sullivan's series of small banks in the Middle West. His most notable works were designed during his partnership with William Gray Purcell and George Feick, Jr. (1910–12), and with Purcell only (1912–20), in Minneapolis, Minn. Among these are the Bradley residence, Woods Hole, Mass. (1911); the Edison Building, Chicago (1912); and the Woodbury County Courthouse, Sioux City, Iowa (1915–17). After 1920 Elmslie practiced independently in Chicago.

Elodea, genus of submerged aquatic plants useful in aquariums and in laboratory demonstrations of cellular activities. Elodea comprises 12 species in the frog's-bit family (Hydrocharitaceae), native to the New World. The common names waterweed and ditch moss reflect their weedy character in ponds and quiet waterways.

Several species are grown in schools as an experimental plant for demonstrating chloroplasts (green bodies in cells in which photosynthesis takes place), cell nuclei, cyclosis (movement of cellular contents), and oxygen production during photosynthesis. They are also important occasionally outside their natural range (North America) as an obstacle to lake navigation. In Europe, for example, the Canadian waterweed (*Elodea canadensis*) exists as an escaped population of female plants only, which reproduce vegetatively by breaking up.

Elohim, singular ELOAH (Hebrew: God), the God of Israel in the Old Testament. A plural of majesty, the term Elohim—though sometimes used for other deities, such as the Moabite god Chemosh, the Sidonian goddess Astarte, and also for other majestic beings such as angels, kings, judges (the Old Testament *shofetim*), and the Messiah—is usually employed

in the Old Testament for the one and only God of Israel, whose personal name was revealed to Moses as YHWH, or Yahweh (*q.v.*). When referring to Yahweh, *elohim* very often is accompanied by the article *ha-*, to mean, in combination, "the God," and sometimes with a further identification *Elohim hayyim*, meaning "the living God."

Though Elohim is plural in form, it is understood in the singular sense. Thus, in Genesis the words, "In the beginning God (Elohim) created the heavens and the earth." Elohim is monotheistic in connotation, though its grammatical structure seems polytheistic. The Israelites probably borrowed the Canaanite plural noun Elohim and made it singular in meaning in their cultic practices and theological reflections.

Elohist source, also called E SOURCE, biblical source and one of four that, according to the documentary hypothesis, comprise the original literary constituents of the Pentateuch, the first five books of the Bible. It is so called because of its use of the Hebrew term Elohim for God, and hence labelled E, in contrast with another discerned source that uses the term YHWH and is labelled J (after the German transliteration of YHWH). *See also* biblical sources.

elongation, in astronomy, the angular distance in celestial longitude separating the Moon or a planet from the Sun. The greatest elongation possible for the two inferior planets (those closer than the Earth to the Sun) is about 48° in the case of Venus and about 28° in that of Mercury. Elongation may also refer to the angular distance of any celestial body from another around which it revolves or from a particular point in the sky; *e.g.*, the extreme east or west position of a star with reference to the north celestial pole.

elopiform, any member of the order Elopiformes, a group of fishes considered to be the most primitive of living bony fishes. Members of this order, which contains more extinct forms than living species, include the bonefish, tarpon, and ladyfish.

A brief treatment of elopiforms follows. For full treatment, *see* MACROPAEDIA: Fishes.

Living elopiforms range in size from the small bonefishes, which reach only 70 centimetres (28 inches) and weigh about 6.5 kilograms (14.5 pounds), to the 2.5-metre (8-foot) Atlantic tarpon, which may tip the scales at about 150 kg. The body is typically long, although not eel-like, and the tail is large and forked. In these fishes there is an open connection to the swim bladder, allowing air to be taken in at the mouth and passed directly into the swim bladder. In tarpons the swim bladder is highly vascularized and lunglike; these fish are air breathers and will drown if they cannot surface for air. Although adult tarpons inhabit well-oxygenated waters, the juveniles develop in stagnant tidal pools where this alternative mode of respiration enhances their survival.

Elopiform fishes, except for the gisu, dwell in coastal waters as adults and are able to move into brackish or freshwater areas. The Atlantic tarpon is well known for its great leaps out of the water, and both the Pacific tarpon and the ladyfish exhibit a similar rolling behaviour at the surface; these behaviours are probably related to taking in air. Tarpons and ladyfish are fast-swimming coastal predators that feed mainly on other fish. Bonefish are bottom feeders, following the tide in to root for worms and shellfish; they crush the latter with their rounded palatal teeth. The gisu is a deepwater bottom feeder and lives mainly on worms.

The elopiforms are highly fecund; one large female Atlantic tarpon contained an estimated 12,000,000 eggs, about seven times as many as the proverbially prolific codfish. These eggs are shed and fertilized in shallow waters, where they drop to the bottom. They hatch into rib-

bonlike larvae (leptocephalus) and are carried out to sea by currents; only those that remain in inshore waters undergo metamorphosis. Following metamorphosis the juveniles, or postlarvae, migrate into brackish pools or creeks, where they eat small crustaceans and larval insects; they return to the sea as young adults. Gisu larvae, however, undergo all post-larval stages in the deepwater environment that they share with the adults.

Elphege, SAINT: see Aelfheah, Saint.

Elphinstone, Mountstuart (b. Oct. 6, 1779, Dunbartonshire, Scot.—d. Nov. 20, 1859, Hookwood, near Limpsfield, Surrey, Eng.), British official in India who did much to promote popular education and local administration of laws.

Elphinstone entered the civil service in Calcutta with the East India Company in 1795. A few years later he barely escaped death when followers of the deposed prince of Oudh, Wazir Ali, raided British offices at the Benares residency and massacred all within their reach. Elphinstone transferred to the diplomatic service in 1801 as assistant to the resident at Pune; he was stationed at the court of Peshwa Bāji Rāo II, titular head of the Marāthā confederacy. He won distinction in 1803 as political agent and aide-de-camp to Colonel Arthur Wellesley (brother of the governor-general; later Duke of Wellington) in the Marāthā War.

Elphinstone was appointed resident at Nāg-pur in 1804, then was transferred to the Marāthā court at Gwalior in 1807; in 1808 he was sent to negotiate an alliance with the Afghan ruler Shāh Shojā' to prevent a Napoleonic advance upon India. Returning to Pune as resident in 1811, he kept the Marāthās disunited and used the murder of an envoy from Baroda to force a treaty on the peshwa. Elphinstone defeated the peshwa and ended the latter's efforts against British rule at the Battle of Kirkee (November 1817), though the residency at Pune and Elphinstone's notes for future literary works were burned.

Elphinstone was largely responsible for the creation of a British administrative system in the Marāthā territories annexed in 1818, first as Deccan commissioner and then, from 1819 to 1827, as governor of Bombay. Disliking the Anglicized system of government there, he sought to preserve the good in Marāthā institutions and to make allowance for Marāthā sentiment. To the raja of Sātāra he restored a kingdom; to the great territorial magnates he returned lands, privileges, and judicial powers; and to the Brahmans he gave back temple lands and provided awards for learning. He tried to maintain the authority and usefulness of the village headmen and of the tribunals, wherein village elders could administer the law locally. He was a pioneer of state education, and he persisted at a time when others were horrified at the idea of educating the indigenous peoples. Spurred on by his advanced views, the wealthy native inhabitants of Bombay founded by public subscriptions the Elphinstone College in his honour.

Elphinstone traveled in Europe from 1827 to 1829; he later twice refused the governor-generalship of India. He thereafter concentrated on writing his two-volume *History of India* (1841) and on advising the British government on Indian affairs.

Elphinstone, William (b. 1431, Glasgow, Scot.—d. Oct. 25, 1514, Edinburgh), Scottish bishop and statesman, founder of the University of Aberdeen.

Elphinstone was probably the son of a priest and was educated at the University of Glasgow. He was ordained priest (c. 1456) and after four years as a country rector went abroad to the University of Paris, where he became reader in canon law; later he moved

to Orléans. He returned to Scotland about 1471, was appointed rector of the University of Glasgow (1474), and served as official general of Glasgow diocese. He became bishop of Ross (1481) and was translated to Aberdeen (1483), but he was not consecrated until some years later. Elphinstone was sent by James III on embassies to Louis XI of France and to the English kings Edward IV, Richard III, and Henry VII and served James IV on similar diplomatic missions. He was lord chancellor for a few months in 1488 and became keeper of the privy seal in 1492.

Elphinstone's later years were devoted mainly to the establishment of the University of Aberdeen and to the building of St. Mary's College, afterward King's College. The papal bull for the foundation was obtained in 1494, and the royal charter confirming Old Aberdeen as the university seat was granted in 1497. The university, modeled on those of Paris and Bologna and intended to include teaching in law, medicine, and divinity as well as in arts, soon became renowned. Elphinstone also was partially responsible for the introduction of printing into Scotland (1507).

Elsass-Lothringen: see Alsace-Lorraine.

Elsasser, Walter M., in full WALTER MAURICE ELSASSER (b. March 20, 1904, Mannheim, Ger.—d. Oct. 14, 1991, Baltimore, Md., U.S.), German-born American physicist notable for a variety of contributions to science.

Elsasser received the Ph.D. from the University of Göttingen in 1927, then accepted teaching appointments at Frankfurt, Paris, and the California Institute of Technology. He became a U.S. citizen in 1940 and engaged in research for the U.S. Army Signal Corps and the Radio Corporation of America before returning to academic life, holding successive positions at the universities of Pennsylvania, Utah, and California; the Scripps Institution of Oceanography; and Princeton, Maryland, and Johns Hopkins universities.

While Elsasser was a graduate student he correctly predicted that a beam of electrons would be diffracted by a crystalline material; after the neutron was discovered, he predicted the same behaviour for neutrons. Independently of Nobel Prize winner Hans Bethe, Elsasser carried out important work on the likelihood of certain interactions between neutrons and atomic nuclei.

Elsasser formulated what is called the dynamo model of the Earth's structure to account for the origin and properties of its magnetic field. He suggested that convection within the core, driven by the energy of radioactive decay, generates electric currents that interact with concentric spherical shells of the Earth's mantle, which are rotating at different speeds, and that the Coriolis effect produces eddies at the boundaries of these shells.

He also investigated the applicability of contemporary theoretical concepts of physics, especially quantum mechanics, to the biological sciences, presenting his views in *The Physical Foundation of Biology* (1958), *Atom and Organism* (1966), and *The Chief Abstractions of Biology* (1975).

Elsevier FAMILY (Dutch publishing family): see Elzevir family.

Elsheimer, Adam, Elsheimer also spelled EHLSCHEIMER (christened March 18, 1578, Frankfurt am Main [Germany]—d. December 1610, Rome [Italy]), German painter and printmaker, recognized as an important figure in the development of 17th-century landscape painting, noted especially for his atmospheric use of light.

Elsheimer studied with Philipp Uffenbach in Frankfurt, where he learned the basic techniques of German Renaissance art. He also

was influenced by the works of several Dutch landscape painters. He traveled to Munich and later to Venice, where he was inspired by the work of Tintoretto. Elsheimer's works of this period explore the expressive, often mysterious effects of light. When he went to Rome in 1600, Elsheimer joined a group of artists that included Peter Paul Rubens and Paul Brill, and he began to produce paintings of Italian classical subjects and landscapes with small figures, often overpowered by massive foliage. His interest in lighting increased after he studied the works of Caravaggio, who had exploited the dramatic effects of chiaroscuro.

Elsheimer produced small and intricate paintings on copper and many larger, more vigorous drawings. His frequent depiction of illumination by firelight and candlelight was unusual for the period. "Flight Into Egypt" (1609) is one of the first nocturnal landscape paintings in which the Moon and the stars are the principal sources of light. Elsheimer greatly influenced the Dutch and Italian schools, and particularly Rembrandt and Claude Lorrain. His early death had a disturbing effect on other artists of his time.

Elsinore (Denmark): see Helsingør.

Elskamp, Max (b. May 5, 1862, Antwerp, Belg.—d. Dec. 10, 1931, Antwerp), one of the outstanding Belgian Symbolist poets, whose material was the everyday life and folklore of his native city. He was a sincere Roman Catholic, and his poems often reflect his religious sentiments.

Of a well-to-do family, Elskamp was also something of a dilettante and illustrated his works with his own woodcuts. Like most Belgian poets of his generation, he was deeply influenced by literary developments in France; he had personal contacts with both Paul Verlaine and Stéphane Mallarmé. Nevertheless, his religious themes are genuinely Belgian in inspiration. Elskamp repeatedly recalls the simple yet colourful religious experiences of his fellow Catholics and their daily life. He employed a poetic idiom in harmony with these subjects and interspersed with archaic turns of phrase. He also echoed the rhythms of the litanies and liturgies of the church. In his later years Elskamp became melancholic and withdrawn, but the spirit of his most characteristic and successful work is summed up by the title of one of his finest collections, *La Louange de la vie* (1898; "The Praise of Life").

INDEX
first

Elsschot, Willem, pseudonym of ALFONS DE RIDDER (b. May 7, 1882, Antwerp, Belg.—d. June 1, 1960, Antwerp), Flemish novelist and poet whose mordant irony and sympathetic reflections on middle-class life won him lasting popularity.

Elsschot's first work, *Villa des roses* (1913), is an exercise in the naturalism of the period. The novel deals with the middle-class world, recounting events in a French boarding house. Elsschot's two subsequent novels, *De verlossing* (1921; "The Deliverance") and *Lijmen* (1924; *Soft Soap*), went virtually unnoticed during World War I; discouraged, he ceased writing until the 1930s. *Kaas* ("Cheese") was published in 1933, followed by *Tsjip* ("Cheep") in 1934. Laarmans, who is the protagonist in *Kaas*, was introduced in *Lijmen* and reappears in subsequent novels: *Pensioen* (1937; "Pension"), *De leeuwentemmer* (1940; "The Lion Tamer"), and Elsschot's masterpiece, *Het dwaallicht* (1946; "Will-o'-

the-wisp"). Laarmans is a sensitive person who repeatedly fails in business because of his honesty and sympathy for his customers. Elsschot's novels are caustic views of social realities, but a beam of sympathy penetrates the ironic tone. He has no particular thesis to present; instead, what attracts attention is the drama latent in apparently ordinary situations. His poetry was published as *Verzen van vroeger* (1934; "Early Verse") and *Verzen* (3rd ed. 1947).

Elsler, Fanny (b. June 23, 1810, Vienna, Austria—d. Nov. 27, 1884, Vienna), Austrian ballerina who introduced theatricalized folk dance (character dance) into ballet. She was celebrated for her spirited, spectacular dancing and for her technique, especially her point work.

Daughter of a valet and copyist for the composer Franz Joseph Haydn, she studied under Jean-Pierre Aumer and made childhood appearances at the Kärntnerthor Theatre with her sister Theresa, also a dancer. Engagements in Naples, Berlin, and London brought her international fame. After three months of intensive study with Auguste Vestris, she made her Paris Opéra debut in 1834 in Jean Coalli's ballet *La Tempête*, derived from William Shakespeare's *The Tempest*. Her immediate success divided Parisian balletomanes into two camps, since the warmth and spontaneity of her dancing was in marked contrast to the ethereal lightness of her greatest rival, Marie Taglioni. Théophile Gautier called Elssler "the Spaniard from the north." In *La Gypsy* (1839), made famous by her performance of the *cracovienne*, a Polish folk dance, and in *La Tarentule* (1839), she revealed extraordinary pantomimic ability. Her sensational success in *Le Diable boiteux* (1836), in which she introduced the Spanish *cachucha*, challenged Taglioni's supremacy. To unseat her rival, still called the greatest classical ballerina, she made

Fanny Elssler in *La Chatte métamorphosée en femme*, lithograph by M. Alophe, c. 1837

By courtesy of the Dance Collection, New York Public Library, Astor, Lenox and Tilden Foundation

one attempt in Taglioni's favourite ballet, *La Sylphide*; the endeavour was most unsuccessful, since she lacked Taglioni's lightness and elevation.

Between 1840 and 1842 Elssler toured the United States, winning extravagant adulation and earning enormous sums. She had broken her contract with the Paris Opéra in order to extend her American tour and could not

return there, but she danced with continuing success in England, Germany, Italy, and Russia until her retirement in 1851.

Eltinge, Julian, original name WILLIAM DALTON (b. May 14, 1883, Newtonville, Mass., U.S.—d. March 7, 1941, New York, N.Y.), American vaudeville star, often called the greatest female impersonator in theatrical history.

Eltinge
Culver Pictures

Eltinge played his first female role at age 10. A graduate of Harvard, he entered vaudeville in 1904, soon commanding one of the highest salaries in show business. During a successful tour of the United States and Europe in 1907, he gave a command performance for King Edward VII. His stage successes included *The Fascinating Widow* (1911), written for him, in which he played the dual role of Mrs. Monte and Hal Blake; *The Crinoline Girl* (1914); and *Cousin Lucy* (1915). He also starred in several silent motion pictures.

Elton, Charles, in full CHARLES SUTHERLAND ELTON (b. March 29, 1900, Liverpool, Eng.—d. May 1, 1991, Oxford, Oxfordshire), English biologist credited with framing the basic principles of modern animal ecology.

Early influences. Elton was educated first at Liverpool College and then at New College, Oxford, from which he graduated with first-class honours in zoology in 1922. Like many others, Elton rebelled against the strong emphasis on comparative anatomy in zoology at that time. Although most of his contemporaries turned to the physical and chemical analysis of animal mechanisms in the laboratory, Elton, at heart a naturalist, went in the opposite direction—to use the scientific method to study the lives of animals in their natural habitats and interrelationships with their surroundings. He set out to turn natural history into science—the science of ecology. The naturalists are the pioneer observers preparing the ground for the ecologists, who follow with their more quantitative and experimental studies. When Elton began his work, he described it as “the sociology and economics of animals.”

The great naturalists of the past had a marked influence on Elton's outlook. He wrote of Alexander von Humboldt as “perhaps the first ecologist” in that he “created a stirring picture of the plant and animal world as a whole,

with its majestic settings and its complex interplay of forces.” Moreover, Elton recalled that “Humboldt's writings in turn inspired Charles Darwin, who went further than most of his generation in grasping the tremendous intricacy and importance of plant and animal interrelationships.” Elton was particularly impressed by the methodology of the American ecologist Victor Ernest Shelford in his book *Animal Communities in Temperate America as Illustrated in the Chicago Region* (1913). He had an opportunity to apply Shelford's ideas in 1921, when, still an undergraduate, he acted as assistant to Julian Huxley on the University of Oxford expedition to Spitsbergen; at this time he was given a free hand in making an ecological survey of local animal life. He continued this project on three subsequent expeditions to the Arctic, in 1923, 1924, and 1930. Just as Darwin had been much influenced by the *Essay on the Principle of Population* of Thomas Malthus, so was Elton influenced by *The Population Problem* (1922) of Alexander Carr-Saunders, who was also a member of the Oxford expedition to Spitsbergen and who provided Elton with a first-hand introduction to his ideas.

Establishment of ecology. Elton's first book, *Animal Ecology*, published in 1927, was a landmark not only for his brilliant treatment of animal communities but also because the main features of his discussion have remained as leading principles of the subject ever since: food chains and the food cycle, the size of food, niches, and the “pyramid of numbers.” He also developed more comprehensive ideas about the factors that govern animal numbers. As a result of his Arctic experience, Elton had become a biological consultant to the Hudson's Bay Company, a position that allowed him to make his important studies of the fluctuations in the populations of various furbearing mammals revealed in the trappers' records, which date from 1736. This study in turn led to his research on the fluctuations in Britain's mouse and vole populations as they were affected by their changing environmental conditions.

In 1930 appeared his provocative book *Animal Ecology and Evolution*, in which he said that “the balance of nature does not exist and perhaps never has existed.” Moreover, “in periods of stress it is a common thing for animals to change their habitats and usually this change involves migration.” And again, “we are face to face with a process which may be called the *selection of the environment by the animal*, as opposed to the *natural selection of the animal by the environment*.” Unfortunately, his increasing concern with population numbers and their fluctuations did not allow him to pursue these exciting evolutionary ideas.

In 1932 Elton established his Bureau of Animal Population at Oxford. It became both a world centre for the collection of data on variations in animal numbers and a research institute in terrestrial ecology. It attracted workers from many countries, providing training for younger individuals who carried the Elton tradition to distant places, such as California and British Columbia in one hemisphere and Australia and New Zealand in the other. In the same year, he became editor of the new *Journal of Animal Ecology*, which was launched by the British Ecological Society largely under his influence. In 1936 Oxford appointed Elton reader in animal ecology, and Corpus Christi College elected him a senior research fellow.

Elton's extensive work on mice and voles enabled him to assign his bureau at the outbreak of World War II the task of finding practical methods of controlling rodent pests, a study that saved his country much loss of food during those critical years. The methods he and his colleagues developed and the results they achieved are described in *The Control of Rats and Mice* (1954), which has become the model

for such work all over the world. In 1942 he published his study on *Voles, Mice and Lemmings*, and in 1958 he discussed in *The Ecology of Invasions of Animals and Plants* the effects produced by the spread of organisms introduced into an area by both natural and human agencies. After World War II, Elton was engaged primarily in habitat studies; these studies formed the basis of his important volume *The Pattern of Animal Communities* (1966). This work gives more general principles, particularly the inverse pyramid of habitats, which corresponds to his pyramid of numbers.

Elton was elected a fellow of the Royal Society of London in 1953 and foreign member of the American Academy of Arts and Sciences and was awarded the Gold Medal of the Linnean Society in 1967 and the Royal Society's Darwin Medal in 1970. He retired in 1967.

(A.C.Ha./Ed.)

Elton, Lake, highly saline lake, Volgograd oblast (province), Russia, near the Russian border with Kazakhstan. The lake occupies an area of 59 square miles (152 square km) and is only 1–2 feet (0.3–0.6 m) deep. It is 60 feet (18 m) below ocean level. Salt, extracted from the lake since the early 18th century, is used for the production of magnesium chloride. Other minerals are located nearby.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Éluard, Paul, pseudonym of EUGÈNE GRINDEL (b. Dec. 14, 1895, Saint-Denis, Paris, Fr.—d. Nov. 18, 1952, Charenton-le-Pont), French poet, one of the founders of the Surrealist movement and one of the important lyrical poets of the 20th century.

In 1919 Éluard made the acquaintance of the Surrealist poets André Breton, Philippe Soupault, and Louis Aragon, with whom he remained in close association until 1938. Experiments with new verbal techniques, theories on the relation between dream and reality, and the free expression of thought processes produced *Capitale de la douleur* (1926; "Capital of Sorrow"), his first important work,

Éluard, 1947
H. Roger-Viollet

which was followed by *La Rose publique* (1934; "The Public Rose") and *Les Yeux fertiles* (1936; "The Fertile Eyes"). The poems in these volumes are generally considered the best to have come out of the Surrealist movement. At this time Éluard also explored, with André Breton, the paths of mental disorders in *L'Immaculée Conception* (1930).

After the Spanish Civil War Éluard abandoned Surrealist experimentations. His late work reflects his political militance and a deepening of his underlying attitudes: the rejection of tyranny, the search for happiness. In 1942 he joined the Communist Party. His poems dealing with the sufferings and brotherhood of man, *Poésie et vérité* (1942; "Poetry and Truth"), *Au rendez-vous allemand* (1944; "To the German Rendezvous"), and *Dignes*

de vivre (1944; "Worthy of Living"), were circulated clandestinely during World War II and served to strengthen the morale of the Resistance. After the war his *Tout dire* (1951; "Say Everything") and *Le Phénix* (1951) added, in simple language and vivid imagery, to the great body of French popular lyrical poetry.

Elūru, also called ELLORE, town, northeastern Andhra Pradesh state, southern India, at the junction of the Godāvāri and Krishna canal systems. The name of the town was changed to its present form in 1949. Mainly a manufacturing town, Elūru produces textiles and leather products but is most noted for its pile carpets. It is also a centre for trade in rice, oilseeds, tobacco, and sugar. The town has a college affiliated with Andhra University in Waltair. Buddhist archaeological remains are at the nearby village of Pedda Vegi. Pop. (1991) 212,866.

Elvas, town and *concelho* (township), Portalegre *distrito* ("district"), east-central Portugal, on a hill overlooking a plain. The town

Aquaduct of Amoreiras, built between 1498 and 1622, Elvas, Port.

Josef Muench

originated as the Roman *Alpesa* and during its long history was a border fortress besieged by the Moors, Spanish, and French. Main fortifications are a Moorish castle on Roman foundations, seven bastions, and (on adjoining hills) the forts of Santa Lúzia (1641) and Nossa Senhora da Graça (1763). Elvas was ceded to Portugal by the French at the Convention of Sintra (1808). The town's late Gothic cathedral has three naves, and the Aquaduct of Amoreiras (built 1498–1622) still brings water to the town; both are national monuments. Elvas is primarily an agricultural processing centre specializing in plums. Pop. (2001 est.) town, 11,300; (1991) *concelho*, 24,641.

Elvira, Council of, the first known council of the Christian church in Spain, held early in the 4th century at Elvira, near modern Granada. It is the first council of which the canons have survived, and they provide the earliest reliable information on the Spanish church. The exact date is disputed, but some scholars believe it was held either about 300–303 or in 309.

Nineteen bishops and 24 priests, primarily from southern Spain, assembled with the intention of restoring order and discipline in the church. The 81 canons that were adopted reflect the internal life and external relations of the Spanish church in the 4th century. In general, the canons were severe and imposed rigorous discipline for various sins. No reconciliation with the church was allowed for certain sins, including idolatry, repeated adultery, divorce, and incest. The punishment for lesser sins was exclusion from Holy Communion, sometimes for up to 10 years. Members

of the clergy were expected to lead pure and holy lives. Subsequently, some of the canons were included in the canons of later councils, including the Council of Nicaea (325).

Elwood, city, Madison county, east-central Indiana, U.S., northeast of Indianapolis. Established in 1852 as Quincy, it was renamed for an early settler in 1869 because of the existence of another Quincy in Owen county. Local discovery of natural gas in 1887 resulted in an economic boom that lasted until 1903. In 1892 Elwood pioneered in the manufacture of tin. The city is now an important agricultural (especially tomato) trading centre. Diversified manufactures include canned goods, mobile homes, furniture, and glassware. Wendell L. Willkie, the lawyer, businessman, and Republican presidential candidate in 1940, was born in Elwood in 1892. Inc. town, 1872; city, 1891. Pop. (2000) 9,737.

Ely, city, East Cambridgeshire district, county of Cambridgeshire, England. It lies on an "island" of rock that rises above the alluvial Fens and, prior to their draining (1630–52), was a place of refuge. The Isle of Ely is 7 miles (11 km) long and 4 miles (6.4 km) wide. The city itself is situated on the Isle's eastern side on the west bank of the River Ouse.

In the 7th century AD Etheldreda, the daughter of Anna, king of East Anglia, founded a convent there. This was destroyed by the Danes in 870, and a Benedictine monastery was built on the ruins in 970. The Isle of Ely was the scene, in the 11th century, of Hereward the Wake's stand against William I the Conqueror. Shortly afterward, the foundations of the present cathedral were laid by the first

Cathedral Church of the Holy and Undivided Trinity, Ely, Cambridgeshire

A.F. Kersting

Norman abbot of Ely, Simeon (1081–94). The cathedral dominates both the city of Ely and the surrounding countryside. The nave, and the western tower (215 feet [66 m] high), and the transept are Norman.

Modern Ely remains a small locality, catering to tourists and visitors from nearby Cambridge. Pop. (1991) 10,329.

Ely, city, St. Louis county, northeastern Minnesota, U.S., on Shagawa Lake, at the east end of the Vermilion Iron Range. Settled in 1885 as Florence, it was renamed for Samuel P. Ely, a Michigan mining man. Iron ore, discovered there in 1863, has been depleted, and the last underground mine closed in 1967.

The logging industry has also declined, and Ely's economy now depends chiefly on the tourist trade. Ely lies in the heart of Superior National Forest and is the starting point for trips into the vast Boundary Waters Ca-

Boundary Waters Canoe Area near Ely, Minn.

Mit and Joan Mann from CameraMann

noe Area. Vermilion Community College was founded in Ely in 1922. Inc. village, 1888; city, 1891. Pop. (2000) 3,724.

Ely, city, seat (1886) of White Pine county, east-central Nevada, U.S. It is adjacent to East Ely, near the Utah border. Established in 1868 as a gold-mining camp and probably named for John Ely, a mining promoter, the community expanded after 1907 with large-scale copper mining. Copper and other mining industries in the area underwent a major decline in the 1970s and early '80s, however. There is extensive ranching in the locality. Ely is a base for tourists attracted by the region's many mining ghost towns and recreational facilities. The White Pine Public Museum and the Nevada Northern Railway Museum include mining and transportation exhibits. Parts of Humboldt National Forest are nearby. To the southeast is Great Basin National Park and to the south, the Ward Charcoal Ovens Historic State Monument, the site of stone beehive ovens used to produce charcoal for smelting in the 1870s. Inc. 1907. Pop. (2000) 4,041.

Ely, Isle of, former county of England, since 1965 part of the county of Cambridgeshire. The Isle of Ely consists of a hill about 7 miles (11 km) long and 4 miles (6 km) wide that rises above the surrounding fens (low-lying lands that were partly covered by water). The Isle of Ely is the highest point in these fens and was formerly an island surrounded by marshes and swamps; it could only be reached by boat or causeway. This inaccessible location became the scene of Hereward the Wake's resistance to William I the Conqueror about 1070. In the 17th and 18th centuries, the surrounding fens were drained, and the Isle of Ely is now simply a hill in the midst of a low, flat plain whose rich soils provide highly productive farmlands.

The city of Ely (*q.v.*) lies on the northeast portion of the Isle of Ely and is dominated by a magnificent cathedral that dates mostly from the 11th and 12th centuries. The town has been the seat of a diocese since 1108, and until the Reformation its bishops held palatine jurisdiction over the entire Isle of Ely.

Oliver Cromwell lived in a house in Ely from 1636 to 1647 while holding the post of farmer of the cathedral tithes.

The Isle of Ely was a separate administrative county until its amalgamation with Cambridgeshire in 1965 to form the county of Cambridgeshire and Isle of Ely. This county was renamed simply Cambridgeshire in the administrative reorganization of 1974.

Ely, Richard Theodore (b. April 13, 1854, Ripley, N.Y., U.S.—d. Oct. 4, 1943, Old Lyme, Conn.), American economist who was noted for his concern with social problems and the role of economists in solving them.

Ely was educated at Columbia University, graduating in philosophy in 1876, and in Germany, receiving his Ph.D. from the University of Heidelberg in 1879. He was professor of political economy at Johns Hopkins University (1881–92), where his advocacy of greater academic freedom and his then-controversial historical account of the labour movement aroused the indignation of conservative elements, causing him to resign. He then became head of the department of economics at the University of Wisconsin (1892–1925).

Ely combined a strong political commitment with a belief in the need for an ethical approach to economics. An early influence on his beliefs was John Stuart Mill's emphasis on the importance of institutional forces in affecting distribution. This led Ely to a concern with labour unrest and with agricultural economics and the problems of rural poverty.

Among the many civic organizations and institutions he founded or helped to create are the American Economic Association, the American Association for Labor Legislation, and the American Association for Agricultural Legislation. Ely's concern with social-reform legislation and his association with the progressive state government of Wisconsin made him one of the most influential American economists of his time. He wrote a highly successful textbook, *Introduction to Political Economy* (1889), as well as many other books and articles.

Elyot, Sir Thomas (b. *c.* 1490—d. March 26, 1546, Carleton, Cambridgeshire, Eng.), English author and administrator, memorable for his championship and use of English prose for subjects then customarily treated in Latin. Both as a philosopher and as a lexicographer, he endeavoured to "augment our Englysshe tongue" as a medium for ideas.

He was clerk to the Privy Council (1523–30) and was knighted in 1530. A member of Sir Thomas More's circle, Elyot was suspected of being out of sympathy with Henry VIII's plan to divorce Catherine of Aragon and probably owed his lack of advancement to his friendship with More. In 1531 he published *The Boke*

of the Governour

Elyot, drawing by Hans Holbein the Younger; in the Royal Library, Windsor Castle, Berkshire

Copyright reserved

Named the Governour, dedicated to the king, and that autumn went as the king's envoy to the court of the Holy Roman emperor Charles V.

Elyot's very popular *Governour*, a plan for the upbringing of gentlemen's sons who were to bear authority in the realm, was the first important treatise on education in English and did much to form the later English ideal of the gentleman. His *Castel of Helth* was a popular regimen of health that, written in the vernacular and by a layman (although he had received some instruction in medicine), incurred censure but was widely read. His *Dictionary* (Latin into English), the first of its scope, was published in 1538. The aim of all Elyot's works was usefulness: he brought classics and Italian authors to the general public through his translations, he provided practical instruction in his own writings, and he added many new words to the English language.

Elyria, city, seat (1823) of Lorain county, northern Ohio, U.S. It lies along the Black River, just west of Cleveland and south of the city of Lorain. The site was settled in 1817 by Heman Ely, who built a log house, dam, gristmill, and sawmill. The city is now a diversified industrial community that manufactures alloy castings, auto parts, plastics, rivets, tools, heaters and air conditioners, and electric motors. Caves, waterfalls, and a forest tract add to the beauty of Cascade and Elywood parks. Lorain County Community College was established in the city in 1963. Inc. village, 1833; city, 1892. Pop. (2000) city, 55,953; Lorain-Elyria PMSA, 284,664.

Elysium, also called ELYSIAN FIELDS, or ELYSIAN PLAIN, in Greek mythology, originally the paradise to which heroes on whom the gods conferred immortality were sent. It probably was retained from Minoan religion. In Homer's writings the Elysian Plain was a land of perfect happiness at the end of the earth, on the banks of the Oceanus River. A similar description was given by Hesiod of the Isles of the Blessed. In the earlier authors, only those specially favoured by the gods entered Elysium and were made immortal. By the time of Hesiod, however, Elysium was a place for the blessed dead, and, from Pindar on, entrance was gained by a righteous life.

Elytis, Odysseus, also spelled ODYSSEAS ELYTÉS, original surname ALEPOUDHELIS (b. Nov. 2, 1911, Iráklion, Crete [now in Greece]—d. March 18, 1996, Athens, Greece), Greek poet and winner of the 1979 Nobel Prize for Literature. Born the scion of a prosperous Cretan family, he abandoned the family name as a young man in order to dissociate his writing from the family soap business.

Elytis studied law at Athens University and periodically worked in the family business. Intrigued by French Surrealism, and particularly by the poet Paul Éluard, he began publishing verse in the 1930s, notably in *Nea grammata*. This avant-garde magazine was a prime vehicle for the "Generation of the '30s," an influential school that included George Seferis, who in 1963 became the first Greek Nobel laureate for literature. Elytis' earliest poems exhibited a strong individuality of tone and setting within the Surrealist mode. The volume *Prosanatolismoi (Orientations)*, published in 1940, is a collection of his works to that date.

When Nazi Germany occupied Greece in 1941, Elytis joined the antifascist resistance to the Italians in Albania. He became something of a bard among young Greeks; one of his poems, *Asma hērōiko kai penthimo gia ton chameno anthypolochago tēs Avaniās* (1945; "Heroic and Elegiac Song for the Lost Second Lieutenant of the Albanian Campaign"), became an anthem to the cause of freedom. After the war he lapsed into literary silence for almost 15 years, returning to print in 1959

with *To Axion Esti* ("Worthy It Is"; *The Axion Esti*), a long poem reminiscent of Walt Whitman's *Song of Myself*.

Elytis lived in Paris for a short time after the Greek military coup of 1967. His later works include *Ho hēlios ho hēliatoras* (1971; *The Sovereign Sun*), *Ta eterothalē* (1974; "The Stepchildren"), and *Ho mikros nautilos* (1986; *The Little Mariner*).

Elsevir FAMILY, also spelled ELSEVIER, a family of Dutch booksellers, publishers, and printers, 15 members of which were in business between 1587 and 1681. They were best known for their books or editions of the Greek New Testament and the classics.

Louis (1540?–1617), son of a printer of Louvain (now in Belgium), settled in Leiden as a Protestant émigré about 1581, set himself up as a bookbinder and bookseller, published over 100 books, and began the family specialization in learned books. The business in Leiden enjoyed its greatest success between 1622 and 1652 under his son Bonaventure (1583–1652) and grandson Abraham (1592–1652), during which time they became printers to the university. Two notable and widely imitated series were their *Petites Républiques*, 35 volumes concerned with different countries and published between 1625 and 1649, and their literary classics. The Leiden bookshop was closed in 1659, but publishing and printing continued, although in declining quantity and quality, until 1681. Members of the family operated branches under the Elsevirs' name at The Hague (c. 1590–1665), Utrecht (c. 1603–75), and Amsterdam (1638–81).

After having enjoyed an almost legendary reputation among bibliophiles for excellence of typography and design, the Elsevirs' work is now regarded only as typical of the high quality that prevailed in their day in Holland. Among their four chief typographical devices, the "solitary," consisting of an elm tree, a fruitful vine, and a man alone, with a motto *Non solus* ("Not alone"), is perhaps the best known.

emaki, also called EMAKIMONO, Japanese illustrated text, or narrative picture scroll. The *makimono*, or horizontal hand-scroll, format was used, and most often the text and illustrations appear on the same scroll.

The earliest extant example of *emaki* was painted in 735. Among the most famous *emaki* is the *Genji monogatari emaki* ("Illustrated Tale of Genji"), painted in the late 11th and early 12th centuries and preserved in the Tokugawa Reimeikai Foundation and the Gotō Art Museum, both in Tokyo.

emanationism, philosophical and theological theory that sees all of creation as an unwilling, necessary, and spontaneous outflow of contingent beings of descending perfection—from an infinite, undiminished, unchanged primary substance. Typically, light is used as an analogy: it communicates itself continually, remains unchanged, and shares its brightness in proportion to the nearness of its object. Emanationism precludes creation out of nothingness. Some scholars classify emanationism with pantheism despite their dissimilarities; however, emanationism does not hold that God is immanent in the finite world.

Hints of this doctrine occur in the first two centuries AD in the writings of Philo, a Hellenistic Jewish philosopher, and of Basilides and Valentinus, both founders of Gnostic schools (stressing esoteric knowledge); but its classic formulation is found in Neoplatonists such as Plotinus and Proclus. It played a prominent role in Gnostic religion. Early Christian writers modified the concept to explain the Trinity of divine Persons. The Jewish Kabbala, a system of mysticism, theosophy, and miracle working, explicates the doctrine; and logicians of the 16th and 17th centuries also employed it. After Gottfried Wilhelm

Leibniz, however, the doctrine lost adherents; and today it has been displaced by theories of evolution.

Emancipation Manifesto (March 3 [Feb. 19, Old Style], 1861), manifesto issued by the Russian emperor Alexander II that accompanied 17 legislative acts that freed the serfs of the Russian Empire. (The acts were collectively called Statutes Concerning Peasants Leaving Serf Dependence, or *Polozheniya o Krestyanakh Vykhodnyashchikh iz Krepostnoy Zavisimosti*.)

Defeat in the Crimean War, a perceptible change in public opinion, and the increasing number and violence of peasant revolts had shown Alexander, who became tsar during the war, that only a thorough reform of Russia's antiquated social structure would put the nation on an equal footing with the Western powers. The abolition of serfdom, he decided, was the first priority. In April 1856, in a speech to a group of noblemen, he revealed his intention. The following January he appointed a secret committee to investigate the problems. When the committee, composed primarily of conservative landowners, failed to draw pertinent conclusions, Alexander publicly authorized the formation of provincial committees of noblemen to formulate plans for emancipating the serfs (December 1857).

By the end of 1859 the committees had sent their proposals to the "editorial commissions," which evaluated them and drafted the preliminary statutes for emancipation (October 1860). These were revised by the Chief Committee (formerly the secret committee) and by the State Council (January 1861) and were signed by the tsar on Feb. 19, 1861, and published on March 5. The final edict, or ukase, was a compromise between the plans of the liberals, the conservatives, the government bureaucrats, and the landed nobility. It fully satisfied no one, particularly the group directly involved: the peasants.

According to the act, the serfs were immediately granted personal liberties and promised land. But the process by which they were to acquire the land was slow, complex, and expensive. They were required to serve their landlords while inventories of all the land were taken, land allotments calculated, and payment calculated, since, legally, the land belonged to the landlord. Peasants, with the government loans, had to "redeem" their land allotments from the landlords and make "redemption payments" to the government for the next 49 years.

By 1881 about 85 percent of the peasants had received their land; redemption was then made compulsory. The land allotments were adequate to support the families living on them and to yield enough for them to meet their redemption payments. But the large population growth that occurred in Russia between emancipation and the Revolution of 1905 made it increasingly difficult for the former serfs to get by economically.

Emancipation had been intended to cure Russia's most basic social weakness, the backwardness and want into which serfdom cast the nation's peasantry. In fact, though an important class of well-to-do peasants did emerge in time, most remained poor and land-hungry, crushed by huge redemption payments. It was not until the revolutionary year of 1905 that the government terminated these payments. By then, the peasant loyalty that the emancipation was intended to create could no longer be achieved.

Emancipation of Labour (Russian revolutionary organization): see Labour, Liberation of.

Emancipation Proclamation, edict issued by U.S. President Abraham Lincoln on Jan. 1, 1863, that freed the slaves of the Confederate states in rebellion against the Union.

Before the start of the Civil War many people and leaders of the North had been primarily concerned merely with stopping the extension of slavery into western territories that would eventually achieve statehood within the Union. With the secession of the Southern states and the consequent start of the Civil War, however, the continued tolerance of Southern slavery by Northerners seemed no longer to serve any constructive political purpose. Emancipation thus quickly changed from a distant possibility to an imminent and feasible eventuality. Lincoln had declared that he meant to save the Union as best he could—by preserving slavery, by destroying it, or by destroying part and preserving part. Just after the Battle of Antietam (Sept. 17, 1862) he issued his proclamation calling on the revolted states to return to their allegiance before the next year, otherwise their slaves would be declared free men. No state returned, and the threatened declaration was issued on Jan. 1, 1863.

As president, Lincoln could issue no such declaration; as commander in chief of the armies and navies of the United States he could issue directions only as to the territory within his lines; but the Emancipation Proclamation applied only to territory outside of his lines. It has therefore been debated whether the proclamation was in reality of any force. It may fairly be taken as an announcement of the policy that was to guide the army and as a declaration of freedom taking effect as the lines advanced. At all events, this was its exact effect.

Its international importance was far greater. The locking up of the world's source of cotton supply had been a general calamity, and the Confederate government and people had steadily expected that the English and French governments would intervene in the war. The conversion of the struggle into a crusade against slavery made European intervention impossible.

The Emancipation Proclamation did more than lift the war to the level of a crusade for human freedom. It brought some substantial practical results, because it allowed the Union to recruit black soldiers. To this invitation to join the army the blacks responded in considerable numbers, nearly 180,000 of them enlisting during the remainder of the war. By Aug. 26, 1863, Lincoln could report, in a letter to James C. Conkling, that "the emancipation policy, and the use of colored troops, constitute the heaviest blow yet dealt to the rebellion."

Two months before the war ended—in February 1865—Lincoln told portrait painter Francis B. Carpenter that the Emancipation Proclamation was "the central act of my administration, and the greatest event of the nineteenth century." To Lincoln and to his countrymen it had become evident that the proclamation had dealt a deathblow to slavery in the United States, a fate that was officially sealed by the ratification of the Thirteenth Amendment in December 1865.

Emancipist, any of the former convicts (and their supporters) in Australia in the late 18th and the first half of the 19th centuries who were struggling for full civil rights. Technically, the term applied only to pardoned convicts; it was generally used as well, however, for "expirees"—convicts whose full terms had been served. Before 1810, Emancipists were given land grants (from which only a few prospered), and some rose to prominence in business and the professions. They were excluded, however, from the political and social life of the New South Wales colony, which was dominated by free settlers and British officials. During the governorship of Lachlan Macquarie (1810–

21), attempts were made to alter this situation. Macquarie sought to introduce prominent Emancipists into the social life of the colony and to allow Emancipist attorneys to practice before the Supreme Court. He also appointed four Emancipists to the magistracy. Macquarie's efforts had the effect of stiffening opposition to Emancipist ambitions, and in the aftermath British imperial policy tended to support the free-settler faction (see *Exclusive*) in their determination to deny the Emancipists full citizenship. In the 1820s and 1830s the Emancipists joined lesser free settlers in supporting a faction of prominent liberals who sought a broadly based representative government for the colony (see *Australian Patriotic Association*). This was achieved in 1842 without restrictions against Emancipist participation.

embalming, the treatment of a dead body so as to sterilize it or to protect it from decay. For practical as well as theological reasons a well-preserved body has long been a chief mortuary concern. The ancient Greeks, who demanded endurance of their heroes in death as in life, expected the bodies of their dead to last without artificial aid during the days of mourning that preceded the final rites. Other societies, less demanding of their greats, developed a wide variety of preservatives and methods to stave off decay or minimize its effects. Corpses have been pickled in vinegar, wine, and stronger spirits: the body of the British admiral Lord Nelson was returned from Trafalgar to England in a cask of brandy. Even the Greeks sometimes made concessions: the body of Alexander the Great, for example, was returned from Babylon to Macedonia in a container of honey. The application of spices and perfumed unguents to minimize putrefaction was so common a practice that the English word embalming had as its original meaning "to put on balm." Generally, however, the word is used to describe a less superficial procedure, the introduction of agents into the body to ensure preservation.

History. The beginnings of the art and techniques of embalming are associated principally with ancient Egypt, where, as in parts of Asia and South America, a dry soil and climate encouraged its development. The early practice of wrapping the dead in cloth and burying them in charcoal and sand beyond the reach of the Nile waters preserved the corpses, which retained form and features for a long period. Those naturally preserved mummies are believed to have influenced the religious doctrines because they seemed to prove that the individual existed after his death. A belief in immortality and physical resurrection was central to Egyptian religion, both to the sun worship of early periods and to the later cult of Osiris. Central to the latter was the belief that when all of the elements that were present in life—soul, name, shadow, heart, and body—were reunited, the person would be resurrected, as the god Osiris was after his brother killed and dismembered him.

Since the body had to be attractive enough to lure back the soul and other elements, the highly skilled and trained embalmers took exquisite care to preserve it. Although it is held that embalming skill reached a peak during the New Kingdom period between 1738 and 1102 BC, the most detailed description of the various methods was given by the 5th-century-BC Greek historian Herodotus. The most elaborate method, at first reserved for the royal dead, involved surgical procedures. The brain, intestines, and other vital organs were removed, washed in palm wine, and placed in vases, known as canopic jars, filled with herbs. The body cavities were filled with powder of myrrh and other aromatic resins

and perfumes. The incisions were stitched, and the body was placed in nitre (potassium nitrate, or saltpetre) for 70 days, after which it was washed, wrapped in cotton bandages, dipped in a gummy substance, and finally coffined and entombed. In a less expensive procedure, oil of cedar was injected into the body, which was then placed in nitre for 70 days. When the body was removed, the oil was withdrawn along with fleshy parts of the body, so that only skin and bones remained. A third method, employed on the bodies of the poor, consisted of purging the intestines and covering the body with nitre for the prescribed period.

A number of other early peoples also practiced embalming of a sophisticated nature. Archaeologists have found evidence of a high degree of embalming skill in the burial chambers of the prehistoric Paraca Indians of Peru. The Guanches, aborigines of the Canary Islands, used methods much like those of the Egyptians, removing the viscera and filling the cavity with salt and vegetable powders. The Jivaro tribes of Ecuador and Peru took the additional precaution of ensuring the immortality of their chiefs by roasting their embalmed bodies over very low fires. In Tibet some bodies are still embalmed according to an ancient formula: the corpse is put in a large box and packed in salt for about three months, after which it is in mummified condition.

The ancient Babylonians, Sumerians, and Greeks seldom practiced any but the most superficial kind of embalming, anointing the body with unguents, perfumes, and spices. Nor did the Jews employ embalming procedures, with the notable exception of Joseph, who ordered embalming for himself and his father, and further departed from Jewish custom by having his body placed in a coffin. Among the ancients who profoundly influenced Western culture only the Romans employed cavity embalming, not for religious reasons but for the temporary preservation of bodies exhibited for some time before burial. Although there is evidence that some early Christians were embalmed, generally they rejected embalming as well as cremation, considering them pagan customs that mutilated the corpse. Such scruples were sometimes overcome by the desire to have an outstanding person linger on, a desire that was reinforced by the belief that the bodies of some of the devout were kept intact after death as a mark of divine favour. Consequently, some Christians were embalmed, a notable example being Charlemagne, whose embalmed and richly dressed corpse was placed in a sitting position in his tomb at Aachen after his death in 814. The body of the 11th-century Spanish epic hero El Cid, which remained seated on an ivory chair in the monastery of San Pedro de Cardena for a decade before burial, is also presumed to have been embalmed.

During the Middle Ages and the Renaissance a modest amount of embalming was done by specialists who employed the elaborate Egyptian method. For its return from France to England, the body of the 12th-century English king Henry I was embalmed and eviscerated and the cavities stuffed with medicinal herbs. But during the Middle Ages, embalming was such an expensive procedure that even most royal personages could not afford it; involving, as it did, the use of costly spices, unguents, wax, and wrappings in addition to the prices charged by skilled embalmers. Moreover, religious opposition was so strong and skill so limited that few would consider it. Instead, cerecloths, strips of fabric impregnated with wax and wrapped snugly around the body to exclude air, were used. This method of preservation was so prevalent that *cerement* became a synonym for grave clothes. The great interest in anatomy and surgery during the Renaissance stimulated experiments with other

embalming methods. Leonardo da Vinci, who dissected at least 50 cadavers for study, developed a method of venous injection for preserving them that anticipated modern embalming procedures. One 17th-century Florentine physician is reported to have turned a corpse to stone by injecting the tissues with a solution of silicate of potash and then immersing the body in a mild acid solution.

Development of modern embalming. Embalming by arterial injection as a mortuary practice is considered to have begun in England in the 18th century. The technique had actually been developed in the first half of the 17th century by the noted English physiologist William Harvey in experiments leading to his discovery of the circulation of blood, during which he injected coloured solutions into the arteries of cadavers. Later the Dutch and German scientists Frederik Ruysch and Gabriel Clauderus are believed to have used similar arterial-injection techniques to prevent cadavers from decomposing. The Scottish anatomist William Hunter (1718–83), however, is credited with being the first to report fully on arterial and cavity embalming as a way to preserve bodies for burial. His discovery attracted wide attention after his younger brother, John Hunter, in 1775 embalmed the body of a Mrs. Martin Van Butchell, whose will specified that her husband had control of her fortune only as long as her body remained above ground. To meet that condition, Van Butchell had her embalmed, placed her fashionably dressed body in a glass-lidded case in a sitting room, and held regular visiting hours.

The demand for embalming grew in England and particularly in the United States, where it was promoted by a newly emerging group of undertaker-businessmen as superior to the customary but awkward and often unsatisfactory method of preserving bodies for transportation or for viewing by packing them in ice or laying them on "cooling boards," with a concave, ice-filled box fitted over the torso and head. Some of the more enterprising entrepreneurs exhibited well-preserved "cases" in the windows of shops, or took them on tour so that persons in rural areas and small towns could see the latest development.

The U.S. Civil War was the turning point in breaking down public resistance to "mutilating" the body and in establishing arterial embalming as a common practice in the United States. Although the government had established national cemeteries for the war dead, it freely awarded contracts to undertakers and embalmers to prepare the bodies of soldiers for shipment home. The widespread use of this service by soldiers' families and the embalming of such notable dead as Pres. Abraham Lincoln's son Willie and later of Lincoln himself brought about increased acceptance of the practice and even caused it to become associated with patriotic activity. Early practitioners included a number of vigorous salesmen, including Joseph H. Clarke, a road salesman for a coffin company. Impressed by embalming's possibilities and profits, he persuaded a staff member of a medical college in Cincinnati to institute a brief course in embalming in 1882, thus establishing the basis of mortuary education in the United States. Embalming remains the only specific skill required in the undertaking business.

Modern procedures. In the modern procedure of embalming, the blood is drained from one of the veins and replaced by a fluid, usually based on Formalin (a solution of formaldehyde in water), injected into one of the main arteries. Cavity fluid is removed with a long hollow needle called a trocar and replaced with preservative. This fluid is also based on Formalin mixed with alcohols, emulsifiers, and other substances (like embalming fluid) to keep the body temporarily from shriveling and turning brown. Arterial embalming is not permanent; even such carefully

prepared corpses as that of Lenin, on view in the Kremlin, must be given periodic renewal treatment. The chief purpose of embalming is rather to give the body a lifelike appearance during the days in which it is being viewed by mourners. To enhance this, cosmetics and masking pastes are often applied.

In the United States, embalming is a standard practice as a result of the government support it has received, and is mandatory when bodies are being transported by common carrier, and, in many states, usually when there is an interval of more than 48 hours between death and burial. In Europe, however, embalming is rarely practiced. In many countries permits are required; in most it is performed only by medical practitioners, and the costs are relatively high.

embankment dam: see earthfill dam.

embargo, the detention of merchant vessels or other property to prevent their movement to a foreign territory. To achieve its objective, an embargo should also prohibit shipment by air and, if necessary, by land. Embargo should be distinguished from *arrêt de prince*, a temporary detention of ships or aircraft; from *angary*, an emergency requisition of the use of foreign merchant vessels; and from boycott, an interruption of commercial and financial relations not confined to exports. An embargo is not imposed against enemy ships or other property, because the status of an enemy subjects such property to other action.

Embargo may be civil or hostile. A civil embargo is the detention of national vessels in home ports either to protect them from foreign depredation or to prevent goods from reaching a particular state. A hostile embargo is the detention of the transport or property of a foreign state.

An embargo may be employed either as a reprisal or for political purposes. As an act of reprisal an embargo may be imposed against a state that is felt to be violating its international legal duties. Of such nature was the U.S. embargo of 1807 against France and Great Britain. An embargo may also be employed for the political purpose of prohibiting exports of arms and other war materials to belligerent states or to states in rebellion, either in an attempt, usually collective, to force a cessation of hostilities or in an individual state's effort to preserve its neutrality. An example of the political embargo was the U.S. embargo of 1937, intended to promote U.S. neutrality during the Spanish Civil War.

Embargoes have been imposed by belligerents on neutral ships and by neutrals on belligerent ships. For example, during World War I, British, French, and even neutral embargoes were imposed in preparation for the exercise of the right of *angary*. In 1918 both Argentina and Chile, which had adopted a neutral policy, detained German ships. In 1940 Norway's prohibition against the carriage of oil to Italy led to an Italian embargo against Norway. In 1941, before it became officially a belligerent, the United States seized German, Italian, Danish, and French ships lying idle in U.S. waters and also froze Axis assets.

When employed as a collective measure of enforcement or prevention by an international organization, the effectiveness of an embargo depends upon cooperation both by members of the organization and, to prevent transshipment to the state subjected to such coercion, by nonmembers. In 1951, during the Korean War, the United Nations General Assembly adopted a U.S. recommendation that members of the UN prohibit shipments of arms and strategic materials to territories controlled by the Chinese and North Korean Communists. Thirty-three members and five nonmembers soon declared their intention to give effect to the resolution, and later the 14 states principally involved formed an international coordinating committee to implement their decision.

This embargo, a means of supplementing UN military action in Korea, continued in effect after the 1953 Panmunjom armistice. In 1974 the Arab oil-producing states embargoed petroleum shipments to the West's industrialized powers in an unsuccessful attempt to force policy changes toward Israel.

Embargo Act (1807), Pres. Thomas Jefferson's nonviolent resistance to British and French molestation of U.S. merchant ships carrying, or suspected of carrying, war materials and other cargoes to the European belligerents. At Jefferson's request the two houses of Congress considered and passed the act quickly in December 1807. All U.S. ports were closed to export shipping in either U.S.

"Embargo," etching by Alexander Anderson reflecting hostile reaction to the Embargo Act of 1807

By courtesy of the Library of Congress, Washington, D.C.

or foreign vessels, and restrictions were placed on imports from Great Britain. The act was a hardship on U.S. farmers as well as on New England and New York mercantile and maritime interests, especially after being buttressed by harsh enforcement measures adopted in 1808. Its effects in Europe were not what Jefferson had hoped. French and British dealers in U.S. cotton, for example, were able to raise prices at will while the stock already on hand lasted; the embargo would have had to endure until these inventories were exhausted. Napoleon is said to have justified seizure of U.S. merchant ships on the ground that he was assisting Jefferson in enforcing the act. The Federalist leader Timothy Pickering even alleged that Napoleon himself had inspired the embargo. Confronted by bitter and articulate opposition, Jefferson on March 1, 1809 (two days before the end of his second term), signed the Non-Intercourse Act, permitting U.S. trade with nations other than France and Great Britain.

Embden, Gustav Georg (b. Nov. 10, 1874, Hamburg—d. July 25, 1933, Nassau, Ger.), German physiological chemist who conducted studies on the chemistry of carbohydrate metabolism and muscle contraction and was the first to discover and link together all the steps involved in the conversion of glycogen to lactic acid.

Embden studied in Freiburg, Strasbourg, Munich, Berlin, and Zürich under the direction of noted physiologists of the day—Johannes von Vries, Franz Hofmeister, Gaule, Paul Ehrlich, and Julius Richard Ewald. In 1904 he became director of the chemistry laboratory of the medical clinic at the Frankfurt-Sachsenhausen municipal hospital.

His research built the clinic into the Physiology Institute by 1907 and into the University Institute for Vegetative Physiology in 1914, the year in which the University of Frankfurt am Main was founded. He retained his directorship, served as a professor at the university, and was rector of the university from 1925 to 1926. His studies in the newly developing field of physiological chemistry were primarily concerned with chemical processes in living organisms, especially intermediate metabolic processes in liver tissue. By developing a technique to prevent tissue damage, he discovered

the important role of the liver in metabolism and did preliminary studies that led to the investigation of normal sugar metabolism and of its pathological form, diabetes.

Embden and his co-workers isolated several intermediate metabolic products from muscle tissue and discovered the important metabolic compound adenylyl phosphoric acid. In all his work he emphasized the relationships between his results and general cellular processes.

Ember Days and Ember Weeks, in the Roman Catholic and Anglican churches, four "times" set apart for special prayer and fasting and for the ordination of the clergy. The Ember Weeks are the complete weeks following (1) Holy Cross Day (September 14); (2) the Feast of St. Lucy (December 13); (3) the first Sunday in Lent; and (4) Pentecost (Whitsunday). The current practice is to compute the Ember Days directly as the Wednesday, Friday, and Saturday following the third Sunday of Advent, the first Sunday of Lent, Pentecost Sunday, and the third Sunday of September.

The exact origin of the Ember seasons is uncertain. In the early church, they were limited to three and may have been the Christian transformation of pagan festivals. From Rome the observance of the Ember Weeks and Days gradually spread throughout the Western Church. On Feb. 17, 1966, Pope Paul VI excluded the Ember Days as days of fast and abstinence for Roman Catholics.

Emberizidae, songbird family in the classification preferred by some authorities, absorbing some groups otherwise placed in the Fringillidae (*q.v.*), order Passeriformes. The family Emberizidae includes some species of buntings, finches, grosbeaks, and sparrows and all juncos; it is sometimes considered to include the tanagers and even the wood warblers. With these groups, the family numbers nearly 900 species. In the narrower sense the Emberizidae includes about 400 species, most of which are small seedeaters with conical bills. Except for a few species in the Old World, the family is confined to the New World. See also bananaquit; honeycreeper; swallow-tanager; tanager; towhee. For *Sporophila*, see seedeater.

Emberres, Gil de: see Siloé, Gil de.

embezzlement, crime generally defined as the fraudulent misappropriation of goods of another by a servant, an agent, or another person to whom possession of the goods has been entrusted. The offense has no single or precise definition. Typically, embezzlement occurs when a person gains possession of goods lawfully and subsequently misappropriates them. In this respect, embezzlement is to be contrasted with the crime of larceny, which requires the taking of goods from the possession of another without the latter's consent. The scope of the old common-law crime of larceny has been gradually extended by various manipulations of the concept of possession. An English statute of 1529 held in effect that a servant who carried away goods entrusted to him by his master had committed larceny, since the legal title as opposed to the physical possession had never been transferred to him. This extension failed to cover situations in which the servant received goods from a third person intended for his master. The failure of the law of larceny to provide adequate protection for the property of employers against the depredations of servants and employees led to the passage of specific statutes.

Some countries limit such statutes to the misappropriation of goods received by an employee "by virtue of his employment." Others broaden the offense to include any property of the principal received by the defendant employee. Some jurisdictions include even property passed to an employee by mistake, while

others require the property to be deliberately covered. The most widely adopted statutes cover custodians of public funds. Many laws subject public servants to severe penalties, even if funds are lost through improper administration rather than a clear attempt to steal. *Compare* fraud; theft.

embiid (insect): *see* webspinner.

Embla (mythology): *see* Ask and Embla.

emblem book, collection of symbolic pictures, usually accompanied by mottoes and expositions in verse and often also by a prose commentary. Derived from the medieval allegory and bestiary, the emblem book developed as a pictorial-literary genre in 16th-century Italy and became popular throughout western Europe in the 17th century.

The father of emblem literature was the 16th-century Italian lawyer and humanist Andrea Alciato, with the *Emblemata* (Latin; 1531), which appeared in translation and in more than 150 editions. The Plantin press specialized in emblem literature, publishing at Antwerp in 1564 the *Emblemata* of the Hungarian physician and historian Johannes Sambucus; in 1565, that of the Dutch physician Hadrianus Junius (Adriaen de Jonghe); and, at Leiden, the early English emblem book, Geoffrey Whitney's *Choice of Emblemes* (1585), an anthology of emblems from Alciato, Junius, and others. English emblem books were either printed in the Netherlands or made by combining English text with foreign engravings, as in the English edition of the *Amorum Emblemata, Figuris Aeneis Incisa* (1608) of Octavius Vaenius (Otto van Veen), an important early Dutch emblem book.

The Netherlands became the centre of the vogue. Vaenius' *Amorum Emblemata* presented metaphors from Ovid and other Latin erotic poets with pictorial representation. The Dutch emblem books were widely translated, plagiarized, and reprinted with different text or engravings. From polyglot editions, begun by Heinsius' verses in Dutch and Latin and later in French, publication of emblem books became an international enterprise, and books

The only English emblem book to achieve widespread popularity was the *Emblemes* (1635) of Francis Quarles, with plates from the *Pia Desideria* and from *Typus Mundi* (1627), popular Jesuit emblem books.

emblemata, plural EMBLEMATA, central panel with figure representations—people, animals, and other objects—or occasionally another featured design motif in a Hellenistic or Roman mosaic. Emblemata were usually executed in *opus vermiculatum*, very fine work with tiny tesserae (stone, ceramic glass, or other hard cubes), and surrounded by floral or geometric designs in coarser mosaic work.

Although some emblemata were large scenes with several figures, most were small, vignette-

Drinking doves, *opus vermiculatum* emblemata from Hadrian's Villa, Tivoli, Italy, either 1st century BC or 2nd century AD; in the Capitoline Museum, Rome
SCALA—Art Resource/EB Inc

like pictures, and many were portable, manufactured ready-made in trays to be set into a larger floor mosaic. The first known emblemata dates from about 200 BC; by the 3rd century, emblemata had given way in Italy to an overall decoration in coarser work, but they continued in common use in the provinces until the early Christian period.

Emboabas, War of the (1708–09), conflict in the Captaincy of Minas Gerais, Brazil, between the original settlers from São Paulo (Paulistas) and new settlers called *emboabas*, who were mostly European immigrants. In the late 17th century the Paulistas had opened gold mines in Minas Gerais and soon came into conflict with the *emboabas*, whom they considered trespassers. In the ensuing civil war the colonial government supported the successful *emboabas*. The Paulistas then moved to Mato Grosso, to the west, where in 1718 they discovered new gold deposits.

embolism, obstruction of the flow of blood by an embolus, a particle or aggregate of substance that is abnormally present in the bloodstream. The substance may be a blood clot that has broken loose from its point of formation (while it is still adherent to the vessel at the point where it was formed, the clot is called a thrombus); it may be a drop of oil from a crushing injury of fatty tissue, a clump of cancer cells, of bacteria, or of detached tissue cells; it may be a foreign body such as a bullet, which has penetrated a vessel wall; or it may be even an air bubble (called an air embolism) or a bubble of some other gas—e.g., nitrogen in decompression sickness.

So long as the embolus travels unimpeded through the bloodstream, it is not likely to cause symptoms or damage. Trouble develops when the substance becomes wedged in a channel, usually an arterial branch, and blocks the flow of blood. Obstruction of a vessel that supplies blood to the brain may cause a stroke, with effects that include a period of unconsciousness, temporary or lasting paralysis of all or part of one side of the body, inability to use words (aphasia), impaired memory, and in severe cases, death. When there is a pul-

monary embolism—an obstruction of blood flow to the lungs by an embolus in the pulmonary artery or in one of its branches—the affected person has difficulty breathing and experiences an unpleasant sensation beneath the breastbone, a feeling like that experienced in angina pectoris. When the blockage causes a section of lung tissue to die (this is called a pulmonary infarction), the affected person becomes feverish, and his heart beats rapidly. The physician attending him notes abnormal chest sounds, an increased number of white cells in the blood, and abnormalities in the chemical composition of the blood (a rise in bilirubin and in certain enzymes). Treatment includes administration of drugs to relieve pain, an anticoagulant to help prevent recurrence due to blood clot formation, and oxygen to aid breathing; fluid intake is reduced, and antibiotics are used to combat or prevent infection. Embolism in a coronary artery, which supplies blood to the heart muscle, can cause a number of serious effects, including death of a section of the heart muscle (myocardial infarction). *See also* thrombosis.

Embomma (Zaire): *see* Boma.

embossing, art of producing raised patterns on the surface of metal, leather, textiles, paper, and other similar substances. Strictly speaking, the term is applicable only to raised impressions produced by means of engraved dies or plates. Crests, monograms, and addresses may be embossed on paper and envelopes from dies set either in small handcrew presses or in ordinary letterpresses. Blocked ornaments on book covers or imitation tooling on leatherwork can be effected by means of powerful embossing presses. For impressing embossed patterns on wallpapers, textiles, and felt, copper cylinders are engraved with the patterns to be raised. The cylinders press against rollers with yielding surfaces or with elevations and depressions corresponding in reverse to those on the cylinders.

Embriaci FAMILY, a powerful Genoese family, whose members played notable roles in the Crusades in the Holy Land in the 11th and 12th centuries. Guglielmo Embriaco and his brother Primo di Castello sailed for the Holy Land in 1099 and participated in the capture of Jerusalem and the defeat of an Egyptian army at Ramla. Guglielmo returned to Genoa to raise fresh troops and then participated in the capture of Arsuf, south of Jaffa (1101). The supposed Holy Grail, thought to be carved from a single great emerald (much later found to be glass), was captured at Caesarea and sent to the cathedral of San Lorenzo in Genoa. Returning to Genoa, Guglielmo served a term as consul of the *comune*.

In 1109 Guglielmo's son Ugo (Hugh) took part in the capture of Giblet, north of Beirut, two-thirds of which was ceded to the Embriaci; 30 years later the family acquired the remaining third, and in 1154 it received the Genoese quarter of Acre. Gradually an autocratic faction, made up of a handful of aristocratic clans, including the Embriaci, gained dominion over the Genoese *comune* and trade with the crusader states. The faction was ousted in Genoa in 1164; nevertheless, the Embriaci continued to rule Giblet. Guglielmo's great-granddaughter, Plaisance, married Bohemond IV of Antioch and Tripoli; their son succeeded as Bohemond V. Eventually, the Embriaci renounced Genoese citizenship and, when the Holy Land fell in 1187, withdrew to Cyprus.

The Embriaci Tower, built in the 12th century, still stands in the old quarter of Genoa.

embroidery, art of decorating material, primarily textile fabric, by means of a needle and thread (and sometimes fine wire). The basic techniques include crewel work, petit point, cross-stitch, and quilting, as well as quillwork and featherwork (*qq.v.*).

VIS AMORIS. LXXIII

of love emblems were exchanged by lovers and formed pretty little encyclopaedias of those "questions of love" that had been the erudite pastime of the academies throughout the Renaissance. Meanwhile, the Dutch emblematis had turned to religious emblems, serving Calvinists as well as Jesuits, who used them for propaganda. In Vaenius' *Amoris Divini Emblemata* (1615), quotations from St. Augustine replace those of Ovid, and Cupid reappears as the soul's preceptor.

Ancient Egyptian tomb paintings show that clothes, couch covers, hangings, and tents were so decorated. Quilting was known to the ancient Persians and, at the time of the Battle of Marathon (490 BC), was worn as armour; Greek vase paintings show these quilted suits covered with embroidery. Greeks depicted on vases from the 7th and 6th centuries BC and later are dressed in embroidered garments.

© Lee Boltin

The earliest surviving embroideries are Scythian, dated to between the 5th and 3rd centuries BC. Roughly from AD 330 until the 15th century, Byzantium produced embroideries lavishly ornamented with gold. Ancient Chinese embroideries have been excavated, dating from the T'ang dynasty (AD 618–907), but the most famous extant Chinese examples are the imperial silk robes of the Ch'ing dynasty (1644–1911/12). In India also it was an ancient craft, but it is from the Mughal period (from 1556) that numerous examples have survived, many finding their way to Europe from the late 17th to the early 18th century through the East India trade. Stylized plant and floral motifs, notably the flowering tree, influenced English embroidery. The Dutch East Indies also produced silk embroideries in the 17th and 18th centuries. In Islāmic Persia, examples survive from the 16th and 17th centuries, when embroideries show geometric patterns far removed by stylization from the animal and plant shapes that inspired them, owing to the Qur'an's proscription of depicting living forms. In the 18th century these gave way to less severe, though still formal, flowers, leaves, and stems. In the 18th and 19th centuries a sort of patchwork called Resht was produced. Of the Middle Eastern work in the first half of the 20th century, there is a colourful peasant embroidery made in Jordan. In western Turkestan, Bokhara work with floral sprays in bright colours was done on covers in the 18th and 19th centuries. From the 16th century, Turkey produced elaborate embroideries in gold and coloured silks with a repertoire of stylized forms such as pomegranates, the tulip motif eventually predominating. The Greek islands in the 18th and 19th centuries produced many geometric embroidery patterns, differing from island to island, those of the Ionian islands and Scyros showing Turkish influence.

Northern European embroidery was, until the Renaissance, mostly ecclesiastical. An extant cape embroidered with eagles, presented to Metz Cathedral by Charlemagne, well represents Carolingian embroidery. The 10th-century stole of St. Cuthbert, embroidered in gold thread, preserved in Durham Cathedral,

is the earliest surviving English embroidery. The 11th-century Bayeux tapestry—which is, in fact, embroidery—is Norman work done in England. The Crusades transmitted motifs of Saracenic art (such as pairs of confronting stylized animals), further reinforced Byzantine influence in Europe, and initiated heraldic embroidery. The sacks of Antioch (1098) and Constantinople (1204) resulted in pillage of embroideries, which (possibly as “civilties” gifts) were afterward presented to the church. Heraldry, also a formative influence after this time, is represented by the tunic (c. 1376) of the Black Prince in Canterbury Cathedral. The greatest period of English embroidery was 1100–1350, when it was known all over Europe as *opus anglicanum* (Latin: “English work”). In 1561 Elizabeth I granted a charter of incorporation to the Broderer's Company, a further step in the development of secular embroidery already apparent in Henry VIII's reign. Sixteenth-century English and French embroidery were closely related, both tending, for example, to adapt engraved designs for their needlework patterns. Embroidery during this period was becoming an amateur craft rather than a profession, a change that was even more marked in the 17th century. The fashion for crewel work, or worsted embroidery, dates largely from the 17th century, as does needlepoint, or canvas work. Samplers, used to record stitches and designs, became mainly decorative after the appearance of pattern books.

Detail of an embroidered waistcoat, French, 1800–25; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York City, gift of United Piece Dye Works, 1936

Embroidery in 17th- and 18th-century North America reflected European skills and conventions, such as crewel work, although the designs were simpler and the stitches were often modified to save thread; samplers, embroidered pictures, and mourning pictures were the most popular.

In the early 19th century almost all other forms of embroidery in England and North America were superseded by a type of needlepoint known as Berlin woolwork. A later fashion, influenced by the Arts and Crafts movement, was “art needlework,” embroidery done on coarse, natural-coloured linen.

The South American countries were influenced by Hispanic embroidery. The Indians of Central America produced a type of embroidery known as featherwork, using actual feathers, and certain tribes of North America developed quillwork, embroidering skins and bark with dyed porcupine quills.

Embroidery is also commonly used as an embellishment in the savanna of western Africa and in Zaire.

embryo, the early developmental stage of an animal while it is in the egg or within the

uterus of the mother. In humans the term is applied to the unborn child until the end of the seventh week following conception; from the eighth week the unborn child is called a fetus.

A brief treatment of embryonic development follows. For full treatment, see *MACROPAEDIA: Growth and Development, Biological*.

In organisms that reproduce sexually, the union of an ovum with a sperm results in a zygote, or fertilized egg, which undergoes a series of divisions called cleavages as it passes down the fallopian tube. After several cleavages have taken place, the cells form a hollow ball called a blastula. In most mammals the blastula attaches itself to the uterine lining, thus stimulating the formation of a placenta, which will transfer nutrients from the mother to the growing embryo. In lower animals the embryo is nourished by the yolk.

By the process of gastrulation, the embryo differentiates into three types of tissue: the ectoderm, producing the skin and nervous system; the mesoderm, from which develop connective tissues, the circulatory system, muscles, and bones; and the endoderm, which forms the digestive system, lungs, and urinary system. Mesodermal cells migrate from the surface of the embryo to fill the space between the other two tissues through an elongated depression known as the primitive streak. As the embryo develops, the cell layers fold over so that the endoderm forms a long tube surrounded by mesoderm, with an ectodermal layer around the whole.

Nutrients pass from the placenta through the umbilical cord, and the amnion, a fluid-filled membrane, surrounds and protects the embryo. The division of the body into head and trunk becomes apparent, and the brain, spinal cord, and internal organs begin to develop. All of these changes are completed early in embryonic development, by about the fourth week, in humans.

Between the head and the heart, a series of branchial arches, cartilaginous structures that support the gills of fishes and larval amphibians, begin to form. In higher vertebrates these structures form part of the jaw and ear. Limb buds also appear, and by the end of the embryonic stage, the embryo is distinguishable as a representative of its species.

embryology, the study of the formation and development of an embryo and fetus. Before widespread use of the microscope and the advent of cellular biology in the 19th century, embryology was based on descriptive and comparative studies. From the time of the Greek philosopher Aristotle it was debated whether the embryo was a preformed, miniature individual (a homunculus) or an undifferentiated form that gradually became specialized. Supporters of the latter theory included Aristotle; the English physician William Harvey, who labeled the theory epigenesis; the German physician Caspar Friedrich Wolff; and the Prussian-Estonian scientist Karl Ernst, Ritter von Baer, who proved epigenesis with his discovery of the mammalian ovum (egg) in 1827. Other pioneers were the French scientists Pierre Bichat and Marie-François-Xavier Bichat.

Baer, who helped popularize Christian Heinrich Pander's 1817 discovery of primary germ layers, laid the foundations of modern comparative embryology in his landmark two-volume work *Über Entwicklungsgeschichte der Thiere* (1828–37; “On the Development of Animals”). Another formative publication was *A Treatise on Comparative Embryology* (1880–91) by the British zoologist Frances Maitland Balfour. Further research on embryonic development was conducted by the German anatomists Martin H. Rathke and Wilhelm Roux and also by the American sci-

entist Thomas Hunt Morgan. Roux, noted for his pioneering studies on frog eggs (beginning in 1885), became the founder of experimental embryology. The principle of embryonic induction was studied by the German embryologists Hans Adolf Eduard Driesch, who furthered Roux's research on frog eggs in the 1890s, and Hans Spemann, who was awarded a Nobel Prize in 1935. Ross G. Harrison was an American biologist noted for his work on tissue culture.

embryoma (tumour): *see* nephroblastoma.

Embury, Philip (b. 1728, probably in Ballingrane, County Limerick, Ire.—d. August 1775, Camden, N.Y., U.S.), Irish-American preacher and one of the founders of Methodism in the United States.

Embury, portrait by an unknown artist

By courtesy of the John Street United Methodist Church, New York

Converted after a religious experience on Christmas Day, 1752, Embury was soon recognized as a potential leader and was licensed as a local preacher. He emigrated to America in 1760 and settled in New York City, where in 1766 he began to preach. His first sermon was delivered to a company of five persons, whom he organized into a class in his own home. This gathering constituted the first Methodist society in New York City. After two years his audience had grown sufficiently to justify the building of Wesley Chapel (the first John Street Church), and in October of 1768 Embury preached the dedicatory sermon. In 1770 he moved to Ash Grove, near Camden, Washington county, N.Y. There he organized the first Methodist society north of New York City and continued until his death to preach and to act as the civil magistrate.

Emden, city, Lower Saxony Land (state), northwestern Germany, near the Ems River estuary and the North Sea coast of Ostfriesland (East Frisia). Founded about 800, it developed as a port for trade with the Baltic countries. It became the capital of the county of Ostfriesland in the 15th century and received storage and customs rights, by which it dominated the Ems trade. During the 16th-century Dutch wars of independence, it gained much of Holland's trade and became for a time the most important northwestern European port and a centre of Calvinism for Dutch refugees. Their return to the Netherlands and the development of a new course of the Ems farther from the town led to its decline in the 17th century. It passed to Prussia in 1744, to France in 1810–14, and to Hanover in 1815.

After the port was improved and connected to the Ruhr by the Dortmund-Ems Canal in 1899, Emden became the German seaport for Westphalia. Despite severe destruction of the city in World War II, the harbour installations escaped damage, and Emden became one of the busiest ports of Germany. Shipping, shipbuilding, herring fishing, oil refining, and heavy industry dominate the economy. Remains of ramparts from 1616 and of the late

Gothic Great Church (1648) survived World War II. The East Friesland Museum and the town armoury from the 16th and 17th centuries are also notable. Pop. (1992 est.) 51,103.

Emden, Jacob Israel, original name JACOB BEN ZEBI, also called (by acronym) YAA-BETZ (b. June 4, 1697, Altona, Holstein [now in Denmark]—d. April 19, 1776, Altona), rabbi and Talmudic scholar primarily known for his lengthy quarrel with Rabbi Jonathan Eybeschütz (*q.v.*), an antagonism that sundered European Jewry.

Emden was thoroughly trained as a scholar of the Talmud, the rabbinical compendium of law, lore, and commentary. Emden evinced more widespread interests as well, studying Latin and Dutch. His traditionalism was revealed, however, in his belief that a Jew should pursue such secular subjects only during the twilight hour. Emden was a rabbi, serving four years in the city from which he took his name.

After moving to Altona, he established his own private synagogue and printing press and revealed a cantankerous nature in the frequent disputes he engaged in with members of the Jewish community. He attacked such people as the chief rabbi of the community, Ezekiel Katzenellenbogen, for his Talmudic decisions. When Katzenellenbogen died, Jonathan Eybeschütz, a rabbi of great popularity and European reputation, was chosen to take his place. Eybeschütz prescribed amulets to save women from death in childbirth, and one of the charms, with a prayer in cipher to Shabbetai Tzevi, the most important of the Jewish false messiahs, fell into Emden's hands. He publicly denounced the maker of the amulet (without specifying Eybeschütz) as a heretic deserving excommunication, thereby initiating a long, often violent quarrel.

Emden was a prolific and distinguished author of polemical writings, in which he attacked Shabbetaian heresies, and of religious commentaries. His diary is revealing as a record of Jewish thought in his time, and his critical study of the *Zohar*, part of the Jewish mystical writings known as the Kabbala, made clear that it was the work of several hands.

Emden, Robert (b. March 4, 1862, St. Gallen, Switz.—d. Oct. 8, 1940, Zürich), physicist and astrophysicist who developed a theory of expansion and compression of gas spheres and applied it to stellar structure.

In 1889 Emden was appointed to the Technical University of Munich, where he became professor of physics and meteorology in 1907. His famous book *Gaskugeln* (1907; "Gas Spheres") was a very important early work on the theory of stellar structure; it develops the physical theory of a gas sphere acted upon by its own gravity. He also devised a hypothesis, no longer taken seriously, to explain sunspots.

In 1924 Emden became honorary professor of astrophysics at the University of Munich, where he remained until his retirement in 1934. He took a leading role in founding the *Zeitschrift für Astrophysik* ("Journal of Astrophysics") in 1930 and edited it for six years.

Emecheta, Buchi (b. July 21, 1944, Lagos, Nigeria), Nigerian sociologist, poet, playwright, essayist, and children's author whose novels were published in English and German.

Emecheta was married at the age of 16 and followed her husband to London in 1962. The problems that she encountered in London during the early 1960s provided background for her first two books, *In the Ditch* (1972) and *Second-Class Citizen* (1974). The three major themes they introduced were quests for first-class citizenship, self-confidence, and dignity as a woman. She viewed her works as sociological statements that examine the universal female condition although they speak specifically for Nigerian women who are struggling against traditional mores that oppress or limit their progress.

Emecheta's best-known works include *The Bride Price* (1976), *The Slave Girl* (1977), *The Joys of Motherhood* (1979), *Titch the Cat* (1979), *Nowhere to Play* (1980), *Destination Biafra* (1982), *Double Yoke* (1982), *Gwendolen* (1989), and *Kehinde* (1994).

'Emeq Yizre'el (Israel): *see* Esdraelon, Plain of.

Emerald, town, central Queensland, Australia, on the Nogoa River, at the junction of the Capricorn and Gregory highways, 172 miles (276 km) west of Rockhampton. P.F. MacDonald, an early settler, established Emerald Downs station (ranch) in the 1860s. In the 1880s the region's economy depended largely on gemstones, which still are exploited commercially and attract amateur gem collectors. Cattle and sheep raising, together with the cultivation of numerous crops (including cotton) irrigated with water from the Fairbairn Dam, are now the basis of the town's prosperity. Brisbane lies about 570 miles (917 km) to the southeast. Pop. (1991) 6,557.

emerald, grass-green variety of beryl (*q.v.*) that is highly valued as a gemstone. The name comes indirectly from the Greek *smaragdos*, a name that seems to have been given to a number of stones having little in common except a green colour; Pliny's *smaragdus* undoubtedly included several distinct species. Much confusion has arisen with respect to the "emerald" of the Scriptures: the Hebrew word rendered emerald in the Authorized Version probably meant carbuncle, a garnet.

The ancients appear to have obtained emeralds from Upper Egypt, where it is said to have been worked as early as 2000 BC. Greek miners were working the mines in the time of Alexander the Great, and later the mines yielded their gems to Cleopatra. Remains of extensive workings were discovered about 1817; "Cleopatra's Mines" are situated in Jabal Sukayt and Jabal Zabārah near the Red Sea coast, east of Aswān. The Egyptian emeralds occur in mica schist and talc schist.

During the Spanish conquest of South America, vast quantities of emeralds were taken from several rich deposits in Colombia. The only South American emeralds now known occur near Bogotá, Colom. The most famous mine is at Muzo, but workings are known also at Coscuez. The emeralds are found in thin veins in a black bituminous limestone containing ammonites of Lower Cretaceous age.

About 1830 emeralds were discovered in the Urals. They have been worked on the River Takovaya, northeast of Sverdlovsk, where they occur in mica or chlorite schist. Emeralds have been found, also in mica schist, in the Habachtal, Austria, in granite in Eidsvold, Norway, and in a pegmatite vein piercing slaty rocks near Emmaville, N.S.W., Australia. Fine crystals have been obtained from Hiddenite, N.C., in the United States.

Many virtues were formerly ascribed to emeralds. When worn, the stone was held to be a preservative against epilepsy, and when held in the mouth it was believed to be a cure for dysentery. It was supposed to assist women at childbirth, to drive away evil spirits, and to preserve the chastity of the wearer. Administered internally, it was reputed to have great medicinal value. Its refreshing green colour was said to be good for the eyesight.

The physical properties of emerald are essentially the same as those of beryl. Its refractive and dispersive powers are not high, so that cut stones display little brilliancy or fire. The magnificent colour that gives extraordinary value to this gem is probably due to small amounts of chromium. The stone loses colour when strongly heated.

Because of emerald's high value, attempts were long made to manufacture it synthetically. These efforts finally met with success

Emerald box, formerly among the crown jewels of Iran

between 1934 and 1937, when a German patent was issued to cover its synthesis. Synthetic emeralds are currently manufactured in the United States by either a molten-flux process or a hydrothermal method; in the latter technique, aquamarine crystals are placed in a water solution at elevated temperature and pressure and used as a seed to produce emeralds. The crystals thus grown appear very similar to natural crystals and rival them in colour and beauty.

emergence, in evolutionary theory, the rise of a system that cannot be predicted or explained from antecedent conditions. George Henry Lewes, the 19th-century English philosopher of science, distinguished between resultants and emergents—phenomena that are predictable from their constituent parts and those that are not (*e.g.*, a physical mixture of sand and talcum powder as contrasted with a chemical compound such as salt, which looks nothing like sodium or chlorine). The evolutionary account of life is a continuous history marked by stages at which fundamentally new forms have appeared: (1) the origin of life; (2) the origin of nucleus-bearing protozoa; (3) the origin of sexually reproducing forms, with an individual destiny lacking in cells that reproduce by fission; (4) the rise of sentient animals, with nervous systems and protobrains; and (5) the appearance of cogitative animals, namely humans. Each of these new modes of life, though grounded in the physicochemical and biochemical conditions of the previous and simpler stage, is intelligible only in terms of its own ordering principle. These are the cases of emergence.

Early in the 20th century, the British zoologist C. Lloyd Morgan, one of the founders of animal psychology, emphasized the antipode of the principle: nothing should be called an emergent unless it can be shown not to be a resultant. Like Lewes, he treated the distinction as inductive and empirical, not as metempirical or metaphysical—*i.e.*, not beyond the observable realm. Morgan condemned the 20th-century French intuitionist Henri Bergson's creative evolution as speculative, while proclaiming emergent evolution as a scientific theory. Even so, the theory has not been accepted universally by biologists. With genetics illuminating the mechanism of heredity (and hence the very conditions of evolution) and biochemistry elucidating the workings of the cell nucleus, some biologists are confirmed in their belief that scientific treatment admits only of analysis into parts and not into new kinds of wholes. Thus, they tend to concentrate on the mechanisms of mutation and of natural selection, effective in microevolution—the change from variety to variety and species to species—and to extrapolate these

findings to macroevolution, to the origin of the great groups of living things.

Nevertheless, the concept of emergence still figures in some evolutionary thinking. In the 1920s and '30s, Samuel Alexander, a British realist metaphysician, and Jan Smuts, the South African statesman, espoused emergence theories; and later, others, such as the Jesuit paleontologist Pierre Teilhard de Chardin and the French zoologist Albert Vandel, emphasized the series of levels of organization, moving toward higher forms of consciousness. The philosophy of organism of Alfred North Whitehead, the leading process metaphysician, with its doctrine of creative advance, is a philosophy of emergence; so also is the theory of personal knowledge of Michael Polanyi, a Hungarian scientist and philosopher, with its levels of being and of knowing, none of which are wholly intelligible to those they describe.

emergency medicine, medical specialty emphasizing the immediacy of treatment of acutely ill or injured individuals.

Among the factors that influenced the growth of emergency medicine was the increasing specialization in other areas of medicine. With the shift away from general practice—especially in urban centres—the emergency room became for many, in effect, a primary source of health care. Another factor was the adoption of a number of standard emergency procedures—such as immediate paramedic attention to severe wounds and the rapid transportation of the ill or injured to a hospital—that had evolved in the military medical corps; as used in the civilian hospital, these techniques resulted in such measures as the training of paramedics and the development of the hospital emergency room as a major trauma centre.

Together these factors led to a greatly increased demand for emergency services and in the early 1960s led to the full-time staffing of hospital emergency rooms. The physicians who led the emergency-room team, once recruited from other specialties, felt an increasing demand for training in the management of both major traumas and a wide range of acute medical problems. Emergency medicine became an officially recognized specialty in 1979. In the following decades, prehospital care benefited from technological advances, particularly in the area of cardiac life-support.

Emerson, Peter Henry (b. May 13, 1856, Cuba—d. May 12, 1936, Falmouth, Cornwall, Eng.), English photographer, one of the first to promote photography as an independent art and to formulate an aesthetic theory for photography based on its peculiar characteristics.

Trained as a physician, Emerson first began to photograph as an aid to an anthropological

study of the peasants and fishermen of East Anglia. These photographs were published in such books as *Life and Landscape on the Norfolk Broads* (1886) and *Pictures of East Anglian Life* (1888). They form an intimate documentation of rural English life in the late 19th century.

Emerson soon became convinced that photography was a medium of artistic expression superior to all other black-and-white graphic media because it reproduces the light, tones, and textures of nature with unrivaled fidelity. He was repelled by currently fashionable composite photographs, which sought artistic merit by imitating sentimental genre paintings. In his handbook *Naturalistic Photography* (1889), he outlined his system of aesthetics, which he called naturalism. A correct photograph, he stated, should be direct and simple, showing real people in their own environment, not costumed models posed before fake backdrops. Compositions should be spontaneous, ignoring predetermined formulas. Above all, photographs should look like photographs, not paintings.

Emerson's book was so persuasive that, after its publication, he was generally considered one of the world's leading photographers. In 1891, however, he published a black-bordered pamphlet "The Death of Naturalistic Photography," recanting his opinion that the accurate reproduction of nature was synonymous with art. Nevertheless, his original views remained influential and formed the rationale of much 20th-century photography.

Emerson, Ralph Waldo (b. May 25, 1803, Boston, Mass., U.S.—d. April 27, 1882, Concord, Mass.), American lecturer, poet, and essayist, the leading exponent of New England Transcendentalism.

Early life and works. Emerson was the son of the Reverend William Emerson, a Unitarian clergyman and friend of the arts. The son inherited the profession of divinity, which had attracted all his ancestors in direct line from Puritan days. The family of his mother, Ruth Haskins, was strongly Anglican, and among

Ralph Waldo Emerson, lithograph by Leopold Grozeller, 1859

By courtesy of The Library of Congress, Washington, D.C.

influences on Emerson were such Anglican writers and thinkers as Ralph Cudworth, Robert Leighton, Jeremy Taylor, and Samuel Taylor Coleridge.

On May 12, 1811, Emerson's father died, leaving the son largely to the intellectual care of Mary Moody Emerson, his aunt, who took her duties seriously. In 1812 Emerson entered the Boston Public Latin School, where his juvenile verses were encouraged and his literary gifts recognized. In 1817 he entered Harvard College, where he began his journals, which may be the most remarkable record of the "march of Mind" to appear in the United States. He graduated in 1821 and taught school while preparing for part-time study in

the Harvard Divinity School. Though Emerson was licensed to preach in the Unitarian community in 1826, illness slowed the progress of his career, and he was not ordained to the Unitarian ministry at the Second Church, Boston, until 1829. There he began to win fame as a preacher, and his position seemed secure. In 1829 he also married Ellen Louisa Tucker. When she died of tuberculosis in 1831, his grief drove him to question his beliefs and his profession. But in the previous few years Emerson had already begun to question Christian doctrines. His older brother William, who had gone to Germany, had acquainted him with the new biblical criticism and the doubts that had been cast on the historicity of miracles. Emerson's own sermons, from the first, had been unusually free of traditional doctrine and were instead a personal exploration of the uses of spirit, showing an idealistic tendency and announcing his personal doctrine of self-reliance and self-sufficiency. Indeed, his sermons had divested Christianity of all external or historical supports and made its basis one's private intuition of the universal moral law and its test a life of virtuous accomplishment. Unitarianism had little appeal to him by now, and in 1832 he resigned from the ministry.

Mature life and works. When Emerson left the church, he was in search of a more certain conviction of God than that granted by the historical evidences of miracles. He wanted his own revelation—i.e., a direct and immediate experience of God. When he left his pulpit he journeyed to Europe. In Paris he saw Antoine-Laurent de Jussieu's collection of natural specimens arranged in a developmental order that confirmed his belief in man's spiritual relation to nature. In England he paid memorable visits to Samuel Taylor Coleridge, William Wordsworth, and Thomas Carlyle. At home once more in 1833, he began to write *Nature* and established himself as a popular and influential lecturer. By 1834 he had found a permanent dwelling place in Concord, Mass., and in the following year he married Lydia Jackson and settled into the kind of quiet domestic life that was essential to his work.

The 1830s saw Emerson become an independent literary man. During this decade his own personal doubts and difficulties were increasingly shared by other intellectuals. Before the decade was over his personal manifestos—*Nature*, "The American Scholar," and the divinity school *Address*—had rallied together a group that came to be called the Transcendentalists, of which he was popularly acknowledged the spokesman. Emerson helped initiate Transcendentalism (*q.v.*) by publishing anonymously in Boston in 1836 a little book of 95 pages entitled *Nature*. Having found the answers to his spiritual doubts, he formulated his essential philosophy, and almost everything he ever wrote afterward was an extension, amplification, or amendment of the ideas he first affirmed in *Nature*.

Emerson's religious doubts had lain deeper than his objection to the Unitarians' retention of belief in the historicity of miracles. He was also deeply unsettled by Newtonian physics' mechanistic conception of the universe and by the Lockean psychology of sensation that he had learned at Harvard. Emerson felt that there was no place for free will in the chains of mechanical cause and effect that rationalist philosophers conceived the world as being made up of. This world could be known only through the senses rather than through thought and intuition; it determined men physically and psychologically; and yet it made them victims of circumstance, beings whose superfluous mental powers were incapable of truly ascertaining reality.

Emerson reclaimed an idealistic philosophy

from this dead end of 18th-century rationalism by once again asserting the human ability to transcend the materialistic world of sense experience and facts and become conscious of the all-pervading spirit of the universe and the potentialities of human freedom. God could best be found by looking inward into one's own self, one's own soul, and from such an enlightened self-awareness would in turn come freedom of action and the ability to change one's world according to the dictates of one's ideals and conscience. Human spiritual renewal thus proceeds from the individual's intimate personal experience of his own portion of the divine "oversoul," which is present in and permeates the entire creation and all living things, and which is accessible if only a person takes the trouble to look for it. Emerson enunciates how "reason," which to him denotes the intuitive awareness of eternal truth, can be relied upon in ways quite different from one's reliance on "understanding"—i.e., the ordinary gathering of sense-data and the logical comprehension of the material world. Emerson's doctrine of self-sufficiency and self-reliance naturally springs from his view that the individual need only look into his own heart for the spiritual guidance that has hitherto been the province of the established churches. The individual must then have the courage to be himself and to trust the inner force within him as he lives his life according to his intuitively derived precepts.

Obviously these ideas are far from original, and it is clear that Emerson was influenced in his formulation of them by his previous readings of Neoplatonist philosophy, the works of Coleridge and other European Romantics, the writings of Emmanuel Swedenborg, Hindu philosophy, and other sources. What set Emerson apart from others who were expressing similar Transcendentalist notions were his abilities as a polished literary stylist able to express his thought with vividness and breadth of vision. His philosophical exposition has a peculiar power and an organic unity whose cumulative effect was highly suggestive and stimulating to his contemporary readers' imaginations.

In a lecture entitled "The American Scholar" (Aug. 31, 1837), Emerson described the resources and duties of the new liberated intellectual that he himself had become. This address was in effect a challenge to the Harvard intelligentsia, warning against pedantry, imitation of others, traditionalism, and scholarship unrelated to life. Emerson's "Address at Divinity College," Harvard University, in 1838 was another challenge, this time directed against a lifeless Christian tradition, especially Unitarianism as he had known it. He dismissed religious institutions and the divinity of Jesus as failures in man's attempt to encounter deity directly through the moral principle or through an intuited sentiment of virtue. This address alienated many, left him with few opportunities to preach, and resulted in his being ostracized by Harvard for many years. Young disciples, however, joined the informal Transcendental Club (founded in 1836) and encouraged him in his activities.

In 1840 he helped launch *The Dial*, first edited by Margaret Fuller and later by himself, thus providing an outlet for the new ideas Transcendentalists were trying to present to America. Though short-lived, the magazine provided a rallying point for the younger members of the school. From his continuing lecture series, he gathered his *Essays* into two volumes (1841, 1844), which made him internationally famous. In his first volume of *Essays* Emerson consolidated his thoughts on moral individualism and preached the ethics of self-reliance, the duty of self-cultivation, and the need for the expression of self. The second volume of *Essays* shows Emerson accommodating his earlier idealism to the lim-

itations of real life; his later works show an increasing acquiescence to the state of things, less reliance on self, greater respect for society, and an awareness of the ambiguities and incompleteness of genius.

His *Representative Men* (1849) contained biographies of Plato, Swedenborg, Montaigne, Shakespeare, Napoleon, and Goethe. In *English Traits* he gave a character analysis of a people from which he himself stemmed. *The Conduct of Life* (1860), Emerson's most mature work, reveals a developed humanism together with a full awareness of man's limitations. It may be considered as partly confession. Emerson's collected *Poems* (1846) were supplemented by others in *May-Day* (1867), and the two volumes established his reputation as a major American poet.

By the 1860s Emerson's reputation in America was secure, for time was wearing down the novelty of his rebellion as he slowly accommodated himself to society. He continued to give frequent lectures, but the writing he did after 1860 shows a waning of his intellectual powers. A new generation knew only the old Emerson and had absorbed his teaching without recalling the acrimony it had occasioned. Upon his death in 1882 Emerson was transformed into the Sage of Concord, shorn of his power as a liberator and enrolled among the worthies of the very tradition he had set out to destroy.

Emerson's voice and rhetoric sustained the faith of thousands in the American lecture circuits between 1834 and the American Civil War. He served as a cultural middleman through whom the aesthetic and philosophical currents of Europe passed to America, and he led his countrymen during the burst of literary glory known as the American renaissance (1835–65). As a principal spokesman for Transcendentalism, the American tributary of European Romanticism, Emerson gave direction to a religious, philosophical, and ethical movement that above all stressed belief in the spiritual potential of every man.

BIBLIOGRAPHY. Collections of Emerson's writings include *The Complete Works of Ralph Waldo Emerson*, ed. by Edward Waldo Emerson, 12 vol. (1903–04, reissued 1968); *Journals and Miscellaneous Notebooks*, ed. by William H. Gilman et al., 16 vol. (1960–82); and *Emerson's Literary Criticism*, ed. by Eric W. Carlson (1979). See also *The Letters of Ralph Waldo Emerson*, ed. by Ralph L. Rusk, 6 vol. (1939, reprinted 1966).

Contemporary biographies include Oliver Wendell Holmes, *Ralph Waldo Emerson* (1885, reprinted 1980); and James Elliot Cabot, *A Memoir of Ralph Waldo Emerson*, 2 vol. (1887, reprinted 1969), by Emerson's literary executor. The standard scholarly biography is Gay Wilson Allen, *Waldo Emerson* (1981). Other modern treatments are Ralph L. Rusk, *The Life of Ralph Waldo Emerson* (1949, reissued 1967); and Donald Yonella, *Ralph Waldo Emerson* (1982).

Robert E. Burkholder and Joel Myerson (comps.), *Critical Essays on Ralph Waldo Emerson* (1983), is a useful collection. Aspects of Emerson's works are discussed in Arthur Christy, *The Orient in American Transcendentalism: A Study of Emerson, Thoreau, and Alcott* (1932, reissued 1978); Vivian C. Hopkins, *Spires of Form: A Study of Emerson's Aesthetic Theory* (1951, reissued 1965), a discussion of Emerson's employment of Romantic organicism; Lewis Leary, *Ralph Waldo Emerson: An Interpretive Essay* (1980), a general introduction to Emerson's art and thought; Sherman Paul, *Emerson's Angle of Vision: Man and Nature in American Experience* (1952, reissued 1969), a discussion of the Law of Correspondence, which lies at the core of Emerson's epistemology; Hyatt H. Waggoner, *Emerson As Poet* (1974), a depiction of Emerson as a major figure in the development of American verse; Stephen E. Whicher, *Freedom and Fate: An Inner Life of Ralph Waldo Emerson*, 2nd ed. (1971), a study of the modification of Emerson's idealism.

emery, granular rock consisting of a mixture of the mineral corundum (aluminum oxide, Al₂O₃) and iron oxides such as magnetite

(Fe₃O₄) or hematite (Fe₂O₃). Long used as an abrasive or polishing material, it is a dark-coloured, dense substance, having much the appearance of an iron ore. In addition to corundum and iron oxide, emery sometimes contains diaspore, gibbsite, margarite, chloritoid, and sillimanite.

Emery has been worked from very early times on the Greek island of Naxos; it occurs there as loose blocks and as lenticular, or lens-shaped, masses or irregular beds in granular limestone associated with crystalline schists. Important deposits, similar to that on Naxos, occur in Turkey, where emery is found as detached blocks in a reddish soil and as rounded masses embedded in a crystalline limestone associated with mica schist, gneiss, and granite. Turkey is now the major world producer of emery. Emery has been worked at several localities in the United States, most notably at Peekskill, N.Y.

The Mohs hardness of emery is about 8, whereas that of pure corundum is 9. Emery's hardness has made it popular as an abrasive, particularly in sandpapers, although it has largely been replaced by synthetic materials such as alumina. Its largest application now is that of a nonskid material in floors, stair treads, and pavements. A very fine emery dust is used by lens grinders, lapidaries, and plate-glass manufacturers, although here too synthetic abrasives are often preferred for their more uniform grain sizes and properties. Emery wheels, once quite common, were made by mixing the powdered material with a bonding medium such as clay and firing in a kiln. In emery sticks, cloth (also called crocus cloth), and paper, the powdered emery is bonded to the backing with adhesive.

emesis: see vomiting.

emf: see electromotive force.

Emi Koussi (mountain, Chad): see Koussi, Mount.

emigration, the departure from a country for life or residence in another. See human migration.

émigré, any of the Frenchmen, mostly aristocrats, who fled France at the time of the French Revolution of 1789. From their places of exile in other countries, the émigrés plotted against the Revolutionary government, seeking foreign help in their goal of restoring the old regime. The Revolutionary leaders in France, fearful of their activity, took action against them: émigrés who did not return by January 1792 were liable to death as traitors; in the same year their property was confiscated by the state.

Under the leadership of King Louis XVI's oldest brother, the comte de Provence (future king Louis XVIII), many émigrés set up a court at Coblenz in the Rhineland. One of their number, Louis-Joseph, prince de Condé, commanded an army of émigrés that assisted foreign powers in the wars against France, but the exiles never posed a serious military threat. A defeat at Quiberon Bay in southern Brittany in July 1795, in an attempt to aid a peasant revolt, dashed their hopes of a military success.

A great number of émigrés also took refuge in England. Juniper Hall, a country house in Mickleham, Surrey, became a home for some and a meeting place for many others passing through or visiting. Louis XVI's brother the comte d'Artois (future king Charles X), who headed the Ultras, or extreme reactionary royalists, spent most of the Revolutionary and Napoleonic years in England. Louis-Philippe, duc d'Orléans and head of the Orleanists (who would become King Louis-Philippe), arrived in England in 1800 after sojourns in Scandinavia and the United States.

Napoleon Bonaparte granted the great majority of émigrés amnesty in 1802, and many

returned to France. After the restoration of the Bourbon monarchy (1814), the émigrés became an important force in French politics, their views ranging from a moderate to an extreme royalist position. Their petitioning resulted in the Law of Indemnity of 1825, designed to reimburse the most needy of those who lost their lands. The gradual disappearance of the émigrés, along with King Louis-Philippe's indifference to their cause, ended their influence.

Emilia-Romagna, *regione*, north-central Italy. It comprises the *province* of Bologna, Ferrara, Forlì, Modena, Parma, Piacenza, Ravenna, Reggio nell'Emilia, and Rimini. The region extends from the Adriatic Sea (east) almost across the peninsula between the Po River (north) and the Ligurian and Tuscan Apennines (west and south). It is bounded by the regions of Veneto and Lombardy on the north, Piedmont and Liguria on the west, and Tuscany, Marche, and the Republic of San Marino on the south. Bologna is the chief city and regional capital.

The northern portion of Emilia-Romagna is a great plain extending from the Po River southeast to Ravenna and Rimini, where the Apennine Mountains come down to the Adriatic coast. The plain's highest point is no more than 200 feet (60 m) above sea level, and along the coast there are lagoons near the mouths of the Po. Immediately to the southwest of the ancient Roman road called the Via Aemilia, the mountains begin to rise, culminating in the central chain of the Apennines. Emilia-Romagna's southern boundary follows the summits of this mountain chain. With the exception of the Po, the region's main rivers descend from these mountains. The Trebbia, Taro, Secchia, and Panaro (affluents of the Po) and the Reno, Ronco, Montone, and Savio (flowing to the Adriatic) are the most important rivers.

The name Emilia comes from the Via Aemilia, a Roman road that traversed the region from Ariminum (Rimini) in the southeast to Placentia (Piacenza) in the northwest; a modern railway closely follows its route. In popular usage the name was transferred to the area (which formed the eighth Augustan region of Italy) as early as the 1st century AD, and it was frequently named as a district under imperial judges. After the 3rd century, Ravenna was, as a rule, not treated as part of Aemilia, the chief town of which was Placentia. In the 6th century, Ravenna became the seat of a Byzantine exarchate.

After the Lombards had for two centuries attempted to subdue the maritime pentapolis (Rimini, Ancona, Fano, Pesaro, and Senigallia), the Frankish king Pepin took these five cities from the Lombard ruler Aistulf and in 755 gave them to the papacy, to which, under the name of Romagna, they continued to belong. The other chief cities of Emilia—Ferrara, Modena, Reggio nell'Emilia, Parma, and Piacenza—were independent. Whether belonging to the Romagna or not, each had a history of its own, and, notwithstanding the feuds of the Guelphs and Ghibellines (papal and imperial factions), they prospered considerably.

Papal supremacy in the Romagna remained little more than nominal until Cesare Borgia, the natural son of Pope Alexander VI, crushed most of the petty princes there, and the Romagna came under papal administration after the death of Alexander in 1503. The papacy also controlled Ferrara and Bologna after the 16th century, while the rest of the region was largely dominated by the Este duchy of Modena and the Farnese duchy of Parma and Piacenza. After a period of Napoleonic domination, the Congress of Vienna (1815) returned Romagna to the papacy and gave the duchy of Parma to Marie Louise, wife of the deposed Napoleon, and Modena to the archduke Francis of Austria, the heir of the last

Este. After a period of continuous unrest and numerous attempts at revolt, Emilia passed to the Italian kingdom almost without resistance in 1860. The name of the region was changed to Emilia-Romagna in 1948.

With its broad lowland and adequate water supply (from both rainfall and irrigation), Emilia-Romagna is one of the leading agricultural regions of Italy. Wheat, corn (maize), fodder, and sugar beets are the principal crops; vegetables and fruits are also grown in the lowlands and grapes on the Apennine slopes. Livestock raising and dairy farming are extensive, and the region has a large food-processing and food-packing industry.

The manufacture of cars and trucks, farm machinery, chemicals and pharmaceuticals, ceramics, and clothing is important. Small hydroelectric stations on the rivers provide power, and these are connected with the Alpine plants so that interchange at different seasons is possible. The discovery of large deposits of natural gas (at Cortemaggiore north of Fidenza and near Ravenna) and of oil (at Busseto near Cortemaggiore) gives the region a vital role in the energy economy of Italy.

Bologna is a communications hub for commerce between northern and southern Italy, and the region is well served by secondary railway lines and highways. Area 8,542 square miles (22,123 square km). Pop. (1994 est.) 3,924,348.

Emin Paşa, Mehmed, original name EDUARD SCHNITZER (b. March 28, 1840, Oppeln, Silesia [now Opole, Pol.]—d. Oct. 23, 1892, Kanema, Congo Free State [now in Zaire]), physician, explorer, and governor of the Equatorial province of Egyptian Sudan who contributed vastly to the knowledge of African geography, natural history, ethnology, and languages.

In 1865 Schnitzer became a medical officer in the Turkish army and used his leisure to begin learning the Turkish, Arabic, and Persian languages. While serving the Ottoman governor of northern Albania (1870–74), he adopted a Turkish mode of living and a Turkish name. In 1876 he joined the British governor-general of the Sudan, General Charles Gordon, as medical officer at Khartoum. In this post he was known as Emin Effendi and was called upon to tend to administrative duties and to carry out diplomatic missions to Uganda and elsewhere. In 1878 Gordon appointed him governor of Equatoria (in the southern Sudan), with the title of bey.

Conducting his excellent and enlightened administration from Lado, Emin traveled throughout the province, made extensive and valuable surveys, and also brought an end to slavery in the region. In the course of the Mahdist uprising, though the Egyptian government abandoned the Sudan (1884), the isolated Emin, now elevated to the rank of pasha, felt secure and was initially reluctant to be rescued by the famed explorer Henry Morton Stanley in 1888. Possibly owing to the arrival of Stanley with his forces, Emin had to contend with disaffection among his own troops. On April 10, 1889, he and Stanley, with some 1,500 others, left the region and crossed over to the eastern African coast, arriving at Bagamoyo, in present-day Tanzania, on Dec. 4, 1889.

The German government then asked him to undertake an expedition to equatorial Africa to secure territories south of and along Lake Victoria to Lake Albert. Soon after the expedition started, however, an Anglo-German agreement was signed (July 1, 1890) excluding Lake Albert from German influence. After experiencing difficulties with German authorities in Tanganyika, he crossed into the Congo Free State (May 1891) and on his journey

to the western African coast was murdered by Arab slave-raiders, among whom he had many enemies.

eminent domain, also called CONDEMNATION, or EXPROPRIATION, power of government to take private property for public use without the owner's consent. Constitutional provisions in most countries require the payment of compensation to the owner. In countries with unwritten constitutions, such as England, the supremacy of Parliament makes it theoretically possible for property to be taken without compensation, but in practice compensation is paid. Confiscation is the term most often used in contrast to eminent domain to describe the taking of property by the state without compensation.

The idea of eminent domain as a power peculiar to sovereign authority but coupled with a duty to pay compensation comes from such 17th-century natural-law jurists as Hugo Grotius and Samuel Pufendorf. The English practice in the early 17th century was for Parliament to authorize the taking of property and either to prescribe the amount to be paid or to provide a judicial proceeding to determine it. The proceeding was held without the presence of the owner. The American colonies developed procedures enabling the owner to be heard on the question of compensation.

There have been few legislative attempts in the United States to control or define just compensation. In general, the judicial definition is that just compensation is the fair market value at the time of the taking, the market value including not only the existing use value but also the best use to which the property may be put. Many states and the federal government have "quick-taking" statutes providing that, upon the deposit of adequate security, the government may take title and possession before the price is judicially decided.

Nearly all other countries have constitutional or statutory provisions requiring that compensation be paid for property taken. The French and German systems, unlike Anglo-American law, require that it be paid in advance of the taking by the government. In the countries influenced by French and German law, the question of the public purpose to be served by the taking is an administrative one and is not determined in the regular courts. Also, there are fewer general statutes providing for blanket authorization of condemnation for particular purposes (such as highways) than there are in the United States, and more often there is a requirement that expropriation of each particular parcel be authorized by the Parliament.

In a landmark ruling in 2005, the U.S. Supreme Court adopted an expansive interpretation of the power of eminent domain as defined in the "takings" clause of the 5th Amendment to the Constitution ("private property [shall not] be taken for public use without just compensation"). Holding that the term "public use" should be understood to mean "public purpose," the Court affirmed that government may take private property not only for use by the public but also for private use that results in a public benefit, in particular economic development.

Eminescu, Mihail, pseudonym of MIHAIL EMINOVICI (b. Jan. 15, 1850, Ipotești, Moldavia, Ottoman Empire,—d. June 15, 1889, Bucharest, Rom.), poet who transformed both the form and content of Romanian poetry, creating a school of poetry that strongly influenced Romanian writers and poets in the late 19th and early 20th centuries.

Eminescu was educated in the Germano-Romanian cultural centre of Cernăuți (now Chernovtsy, Ukraine) and at the universities of Vienna (1869–72) and Berlin (1872–74), where he was influenced by German philoso-

phy and Western literature. In 1874 he was appointed school inspector and librarian at the University of Iași but soon resigned to take up the post of editor in chief of the conservative paper *Timpu*. His literary activity ended in 1883, when he suffered the onset of a mental disorder that led to his death in an asylum.

Eminescu's talent was first revealed in 1870 by two poems published in *Convorbiri literare*, the organ of the Junimea society in Iași. Other poems followed, and he became recognized as the foremost modern Romanian poet. Mystically inclined and of a melancholy disposition, he lived in the glory of the Romanian medieval past and in folklore, on which he based one of his outstanding poems, "Lucafărul" (1883; "The Evening Star").

Eminescu's poetry has a distinctive simplicity of language, a masterly handling of rhyme and verse form, a profundity of thought, and a plasticity of expression which affected nearly every Romanian writer of his own period and after. His poems have been translated into several languages, including an English translation in 1930, but chiefly into German. Among his prose writings, apart from many studies and essays, the best-known are the stories "Cezara" and "Sărmanul Dionis" (1872).

emir, Arabic AMĪR ("commander," or "prince"), in the Muslim Middle East, a military commander, governor of a province, or a high military official. Under the Umayyads, the emir exercised administrative and financial powers, somewhat diminished under the 'Abbasids, who introduced a separate financial officer. Sometimes, as in the cases of the Aghlabids and Tahirids, the emirs ruled virtually independently in their provinces with but token allegiance to the caliph. In other cases the province was first taken by force, then the emirs applied for legitimacy to the caliph.

The title *amir al-mu'minin*, sometimes used of leaders of Muslim military campaigns, was assumed by 'Umar, the second caliph, probably on the basis of the Qur'anic "Obey God and obey the Apostle and those invested with command (*āli al-amr*) among you" (iv, 59); it was used by all his successors until the abolition of the caliphate in 1924.

In the 10th century the commander of the caliph's armies at Baghdad was styled *amir al-umara'* ("commander in chief"). Emir could also denote office, as in *amir al-hajj*, "leader of the pilgrimage" to Mecca, held by the caliph or his delegate, a precedent set by Abū Bakr and Muhammad himself (630 and 631).

The title emir was later adopted by the rulers of several independent states in central Asia, notably those of Bukhara and Afghanistan. In the modern United Arab Emirates, however, none of the rulers of the constituent states are called emirs; all are sheikhs. The word Emirates was included in the name of the federation by default, because *maslyakhah* (sheikhdom) was already in use for the smallest of Arab administrative units, comparable to a parish or township.

emission-control system, in automotive engineering, means employed to limit the discharge of noxious gases from the internal-combustion engine. There are four main sources of these gases: the engine exhaust, the crankcase, the fuel tank, and the carburetor. The exhaust pipe discharges burned and unburned hydrocarbons, carbon monoxide, oxides of nitrogen and sulfur, and traces of various acids, alcohols, phenols, and heavy metals such as lead. The crankcase is a secondary source of unburned hydrocarbons and, to a lesser extent, carbon monoxide. In the fuel tank and the carburetor, the hydrocarbons that are continually evaporating from the gasoline constitute a minor but not insignificant contributing factor in pollution.

A variety of systems for controlling emissions from all sources have been developed. Though the systems vary in detail, they are similar in

principle. Crankcase emission controls provide positive crankcase ventilation by recirculating blowby (the leakage of combustion gases), combined with ventilating air, to the intake manifold for reburning in the combustion chamber.

To control exhaust emissions, which are responsible for two-thirds of the total engine pollutants, two types of system are used: the air-injection system and the improved combustion system. In a typical injection system, an engine-driven pump draws air through the carburetor air cleaner and pumps it into the exhaust ports of the cylinder head, in which it combines with the unburned hydrocarbons and carbon monoxide at high temperature and, in effect, continues the combustion process. In this way a large percentage of the pollutants that were formerly discharged through the exhaust system are eliminated. In some cases a specially designed exhaust manifold known as a thermal reactor is used to promote more complete combustion of the gases.

Improvements in combustion efficiency are effected by modifications in the components that control the whole process of combustion. These modifications have involved changes in the shape of the combustion chamber formed by the end of the piston and the cylinder head; a computer-controlled carburetor to ensure more precise and leaner (lower gasoline content) air-fuel mixtures; spark-timing changes to provide a retarded spark (late ignition) when idling; and increases in the idling speed.

Emissions from the fuel tank and carburetor are reduced by the evaporative control system, the heart of which is a canister of activated charcoal capable of holding up to 35 percent of its own weight in fuel vapour. In operation, the fuel-tank vapours flow from the sealed fuel tank to a vapour separator that returns the raw fuel to the tank and channels the fuel vapour to the canister. Fuel vapours from the carburetor bowl, which are consumed when the engine is running, flow to the canister via the air cleaner when the engine is stopped. The canister acts as a storehouse; when the engine is running, the vapours are purged from the canister through the air cleaner into the combustion chamber, where they are burned.

Other emission controls include the catalytic converter, consisting of an insulated chamber containing pellets of a variety of metal oxides through which the exhaust gases are passed. The hydrocarbons and carbon monoxide in the exhaust are converted to water vapour and carbon dioxide. These systems are not completely effective: during warmup the temperatures are so low that emissions cannot be catalyzed, and the catalysts are rendered ineffective by the lead compounds sometimes added to gasoline.

emission nebula, in astronomy, a bright, diffuse light sometimes associated with supernova remnants or with stars whose temperatures exceed 20,000 K. The excitation process necessary to provide observed optical and radio energies in such gaseous regions was long an astronomical puzzle. Spectral and polarization studies of the 1950s suggested that their luminosity largely results from synchrotron radiation—energy from electrons accelerated in a magnetic field, as seen in certain particle accelerators.

Emma-ō, in Japanese Buddhist mythology, the overlord of hell (Jigoku), corresponding to the Indian deity Yama. He judges the souls of men, while his sister judges the souls of women. The sinner remains forever in one of the 16 regions of fire or ice assigned him by Emma-ō unless saved by the prayers of the living, in which case he is reborn either on earth or in a heavenly paradise. Emma-ō is usually represented with a fierce expression, wearing a Chinese judge's cap and holding his mace of office.

Emmanuel (personal name): *see under* Immanuel, or Manuel, except as below.

Emmanuel Philibert, byname EMMANUEL PHILIBERT IRON-HEAD, French EMMANUEL-PHILIBERT TÊTE DE FER, Italian EMANUELE

FILIBERTO TESTA DI FERRO (b. July 8, 1528, Chambéry, Savoy—d. Aug. 30, 1580, Turin), duke of Savoy who recovered most of the lands his father Charles III had lost to France and Spain. A skilled soldier and a wily diplomat, he was also an able administrator who restored economic equilibrium to Savoy while freeing it from foreign occupation.

Serving in the army of his mother's brother-in-law, the emperor Charles V, in the war against Francis I of France, Emmanuel Philibert distinguished himself by capturing Hesdin (July 1553). When he succeeded his father a month later, he began the reacquisition of his lands. His brilliant victory over the French at Saint-Quentin (August 1557) on the side of the Spanish solidified his power in Savoy. The Peace of Cateau-Cambrésis (1559), ending the wars between Charles V and the French kings, restored part of Emmanuel Philibert's duchy on the understanding that he marry Margaret of France, sister of King Henry II.

Taking advantage of political struggles between the European powers, the duke slowly increased his domain, recovering possessions from the French, including Turin, and other possessions from the Spanish, and buying two territories. He moved Savoy's capital from Chambéry to Turin (1562), substituted Italian for Latin as the official language, and at the time of his death was arranging for the acquisition of the marquise of Saluzzo.

Emmen, *genteente* (municipality), Drenthe province (province), northeastern Netherlands, on the Hondsrug ridge. It was a centre of the fen colonies (*veenkolonien*) established in the 19th century to convert the surrounding peat fields to agricultural use. As peat digging declined after 1920, Emmen suffered considerable unemployment. It has grown rapidly into the foremost urban centre of Drenthe since textile (silk, rayon, synthetics), metallurgical, chemical, pharmaceutical, and timber industries were established there after World War II. Emmen has a zoo and a museum, and in the vicinity are several *hunebedden* ("huns' graves"); prehistoric monuments built with large boulders that were probably deposited during the Ice Age). Immediately south, near Schoonebeek, are oil and gas fields. Pop. (1983 est.) 90,828.

Emmentaler, also spelled EMMENTHALER, also called SWISS CHEESE, cow's-milk cheese of Switzerland made by a process that originated in the Emme River valley (Emmental) in the canton of Bern. The essential process is followed in most other dairying countries, notably Norway, where the Jarlsberg variety is outstanding, and in the United States, where the cheese is generally called "Swiss."

Emmentaler is made in large wheel shapes, about 36 inches (90 centimetres) in diameter by 6 in. (15 cm) in thickness. The curd is formed by rennet. After the usual cutting, stirring, and heating to about 126° F (52° C), all the curd from 2,205 pounds (1,000 kilograms) of milk is lifted from the whey in one mass in a fine-mesh net and pressed into the characteristic wheel. It is shaped in blocks, salted in strong brine, and then wrapped in film to prevent drying. The cheese is held at a temperature of 72° to 80° F (22° to 27° C), so stimulating production of carbon dioxide, which forms the characteristic glossy holes or "eyes" in six to eight weeks. Complete ripening takes three to six months. Pure cultures of *Streptococcus thermophilus*, *Lactobacillus bulgaricus*, and *Propionibacterium shermanii* are used to control development of acid, eyes, and flavour.

This sweetcurd cheese has a pungent, sweetish odour and is slightly salty when fresh, and pleasingly sharp when fully ripened. Its consistency is firm and elastic, and it is easy to slice; the interior is a uniform light yellow in colour with holes about five-eighths in. (approximately 1.6 cm) diameter spaced 2–3 in. (5–7 cm) apart. The rind being kept clean, the cheese cures from the inside; the propionic acid bacteria, which produce carbon dioxide, are largely responsible for the many big holes.

Emmet, Robert (b. 1778, Dublin—d. Sept. 20, 1803, Dublin), Irish nationalist leader who inspired the abortive rising of 1803, remembered as a romantic hero of Irish lost causes.

Like his elder brother Thomas, Robert Emmet became involved with the United Irishmen and from 1800 to 1802 was on the Continent with their exiled leaders, who, with French support, were planning an insurrection against English rule. Back in Ireland in October 1802, he hid at his father's house near Milltown while pikes and other crude weapons were collected and stored in Dublin. In 1803 Emmet's hand was forced by an explosion at one of his secret arms depots, and he called for a rising on July 23. The ill-planned insurrection ended in utter confusion. The Wicklow contingent never arrived; the Kildare men retired thinking the rising had been postponed; while the men at Broadstairs waited vainly for the signal. Wearing a green and white uniform, Emmet marched with a small band against Dublin Castle. On the way they encountered the lord chief justice, Lord Kilwarden, and his nephew, pulled them from their carriage, and murdered them. Realizing the cause was lost, Emmet escaped and hid in the Wicklow Mountains. He then moved to Harold's Cross to be near his fiancée, Sarah Curran, with whom he hoped to escape to America. He was captured on August 25, tried for treason, and hanged on Sept. 20, 1803.

Thomas Moore's songs, "She is far from the land where her young hero sleeps" and "Oh breathe not the name" were inspired by Emmet's love affair with Curran.

Emmet, Thomas Addis (b. April 24, 1764, Cork, County Cork, Ire.—d. Nov. 14, 1827, New York City), lawyer in Ireland and, later, in the United States, a leader of the nationalist Society of United Irishmen, and elder brother of the Irish revolutionary Robert Emmet.

After studying medicine and law he was called in 1790 to the Irish bar, where he defended the patriot leader James Napper Tandy and other anti-British political prisoners. In 1795 he boldly took the United Irishmen's oath in open court, was elected secretary of the Society in the same year, and in 1797 became a director.

Before Lord Edward Fitzgerald's abortive revolt of 1798 he had tried to induce the rebels to wait for French military aid. Arrested with others on March 12, 1798, he was imprisoned until 1802, when he was exiled to Brussels and later moved to Paris. There he sought

Napoleon I's support for an Irish battalion to fight Great Britain, and it was there that he heard of his brother Robert's execution.

In 1804 he went to the U.S., where he soon became a highly successful lawyer. Before the

U.S. Supreme Court he eloquently but unsuccessfully argued the major constitutional case of *Gibbons v. Ogden* (1824), in which the court, in accepting the arguments of Daniel Webster and William Wirt based on the federal commerce power, struck down state impediments to interstate commerce.

Emmett, Daniel Decatur (b. Oct. 29, 1815, Mount Vernon, Ohio, U.S.—d. June 28, 1904, Mount Vernon), U.S. composer of "Dixie" (*q.v.*) and organizer of one of the first minstrel show troupes.

The son of a blacksmith, he joined the army at age 17 as a fifer. After his discharge in 1835 he played the drum in travelling circus bands. He was also a capable violinist, flutist, and singer. In 1843 in New York City he and three co-performers organized the Virginia Minstrels, a troupe that competes with the Christy Minstrels for recognition as the earliest minstrel show troupe. In 1858 Emmett joined the Bryant Minstrels.

His song "Dixie," written in 1859, was originally a "walk-around," or concluding number for a minstrel show. It attained national popularity and was later the unofficial national anthem of the Confederacy during the U.S. Civil War (1861–65) and the South thereafter. Several sets of words, Northern and Southern, were written for the song, but it survives in its version with Emmett's words. Emmett retired in 1888 but subsequently toured in 1895 with A.G. Field's minstrel troupe.

Emmitsburg, town, Frederick County, northern Maryland, U.S., near the Pennsylvania border, 20 mi (32 km) north-northeast of Frederick. Settled in the 1780s as Poplar Fields or Silver Fancy, it was renamed c. 1786 for William Emmet, a local landowner. The first American chapter of the Sisters of Charity was founded there in 1806 by St. Elizabeth Ann Seton (1774–1821), the first native-born American to be canonized (1975) by the Roman Catholic Church. Her cabin is preserved and her tomb, in a chapel on the grounds of St. Joseph's Provincial House, is maintained as a shrine. Nearby Mount St. Mary's College and Seminary was founded in 1808 and is the second oldest Catholic college in the U.S. (after Georgetown University); it incorporates the original buildings of a girls' school founded by Elizabeth Seton in 1809. A replica of the Grotto of Lourdes, on a mountain ridge above the college, was the first national Catholic shrine in the U.S. Catoclin Mountain Park, a few miles southwest, is the site of Camp David (*q.v.*), the presidential retreat. Emmitsburg has a basic agricultural economy (flour

milling, dairying, corn [maize] supplemented by the manufacture of leather goods. Inc. 1874. Pop. (1992 est.) 1,791.

Emmy Award, any of the annual presentations made for outstanding achievement in television in the United States. The name Emmy derives from Immy, a nickname for image orthicon, a camera tube used in television. The Emmy Award statuette consists of a winged woman holding a globe aloft.

The Emmy Awards are made by the National Academy of Television Arts and Sciences. Only members of the academy may vote for the awards, and members vote only within their own discipline—actors voting for actors, writers for writers, and so on. Categories in which awards are granted include dramatic series, comedy series, special drama, limited series, and variety, music, or comedy. Within each of these categories a best program is chosen; and in most categories the best actor and actress, supporting actor and actress, director, and writer are chosen. Awards are also given for special achievement, creative arts, and technical categories.

The National Academy was formed in 1946 and in 1949 presented the first Emmys. In that year six awards were made. Separate ceremonies evolved for news and documentaries in 1973, for daytime programming in 1974, and for prime-time programming in 1977.

emollient, any substance that softens the skin by slowing evaporation of water. Sesame, almond, and olive oils were used in ancient Egypt; beeswax, spermaceti, almond oil, borax, and rosewater in Greece; and lanolin (sheep fat) in medieval Europe. Modern emollients include petrolatum, zinc oxide, paraffin, mineral oil, glycerin, beeswax, olive oil, coconut oil, lanolin, cocoa butter, and such synthetics as butyl stearate and diglycol laurate.

emotion, any of a number of extremely complex phenomena that are a synthesis of subjective experience, expressive behaviour, and neurochemical activity. Though psychologists have not found a simple yet comprehensive definition of emotion, they have generally agreed that emotions entail, to varying degrees, awareness of one's environment or situation, bodily reactions, and approach or withdrawal behaviour.

A brief treatment of emotion follows. For full treatment, see MACROPAEDIA: Emotion, Human.

Contemporary thinking on emotion is grounded in psychological experimentation, but the use of the experimental method in psychology came only after about 1850. The pioneer in this area was the German psychologist Wilhelm Wundt, who performed experiments in which subjects provided introspective reports of their responses to stimuli that were varied in a controlled way. Contemporary with Wundt's work was a theory, offered by English naturalist Charles Darwin, that helped to focus investigation into emotion. In this theory Darwin suggested that emotional behaviour in animals was a vestige of adaptive behaviour from an earlier stage of the given species' development.

A particularly influential early theory of emotion was proposed independently by the American psychologist William James and the Danish physician Carl Georg Lange. The James-Lange theory firmly links mental states to physiological processes: it holds that an emotion is a perception of phenomena within the body. When a person sees a frightening sight, for example, the body immediately responds in certain ways (e.g., the heart rate increases). The perception of bodily response to the original stimulus constitutes the emotion of fear, according to the James-Lange view.

Thus people are happy because they smile, sad because they cry, and afraid because they flee.

It has been shown that emotions are accompanied by physiological changes manifested by excitation of the sympathetic division of the autonomic nervous system; specifically, these changes can be detected in the galvanic skin response (see psychogalvanic reflex), in which the electrical conductivity of the skin varies, and also in the heart rate, blood pressure, perspiration, and others. But according to the James-Lange view, these physiological changes would themselves be stimulated by a perception. It is argued that, by the time a signal from the senses reaches the appropriate centre in the brain, physiological changes have already taken place to cause the signal which then produces the feeling of the emotion. This element of the James-Lange view raised some serious objections.

An American physiologist, Walter B. Cannon, proposed a theory that became one of the chief arguments against the James-Lange view. Cannon showed that subjects reacted emotionally even when nerves connecting the central nervous system to various organs were severed, suggesting that physiological changes were not necessarily the primary cause of emotion. Cannon also proposed that signals from the senses may be received by the thalamus, which performs the dual function of providing the emotional content to the appropriate perceptual centre and transmitting the stimulus to other parts of the body.

Further research has called into question Cannon's view of the preeminence of the thalamus for emotions. But the basic insight of his theory continues to be upheld, with more sophisticated anatomical support. Cannon's successors examined a structure called the reticular formation, in the centre of the brain stem. Electrical activity throughout the brain was found to be accompanied by electrical activity in the reticular formation. Emotion is held to be the result of a certain level of reticular-formation activation, a level less than that necessary to sustain such brain functions as perception and behaviour. Because the reticular formation serves to integrate virtually all brain activity, any perception or action is necessarily infused with emotional content.

A perceptual-motivational theory of emotion was individually proposed by American psychologists Magda Arnold, in 1960, and R.W. Leeper, in 1965. According to the theory, emotions are no more than strong motivational or drive states (see motivation). A motivational state is an inner condition of imbalance (for example, thirst) that provokes an organism to take some remedial action (in this case, to search for a drink). Although this approach to emotion was shown to be incomplete, later research gave evidence of what appear to be anatomical mechanisms of motivation. Significantly, these mechanisms serve a function in emotional behaviour as well.

The mechanisms in question involve the hypothalamus, a small structure near the base of the brain. The hypothalamus plays a very complex role in regulating a variety of physiological processes. It is also involved in behaviour that expresses the emotions of anger and fear. The results of complicated experiments involving electrical stimulation of the hypothalamus and related brain structures have led researchers to propose that emotions result from a dynamic process of stimulation and inhibition of certain bodily movements, as regulated by the hypothalamus.

An objection to this view is that it ignores the cognitive element in emotions. Presumably the same physiological events might be said to underlie emotions directed at different objects; how then are the emotions to be distinguished? It is here that the importance of perception and learning to discussions of emotion is apparent. However, the cognitive

element in emotion cannot be processed by the relatively simple brain structures considered so far. While these can lead to emotional expression, the cognitive element must be processed by more complex structures found in higher parts of the brain.

Modern researchers often view emotions in three components, physiological, expressive, and experiential, each of which can be studied in terms of structure and functions.

Empangeni, town, northeastern KwaZulu/Natal province, South Africa, directly northwest of Richard's Bay on the Indian Ocean and northeast of Durban. The beginnings of the modern settlement can be traced to 1851, when the Norwegian Missionary Society established a station in the valley of a stream named for the large number of *mpange* (hard pear) trees. The station was later moved to another location, but in 1894 a magistracy named Empangeni was established in the valley. The present town site was established in 1931, and Empangeni was declared a town in 1960. Located in one of the important cattle-raising areas in South Africa, the town is the centre of the sugar industry in Zululand and also a market centre for cotton, dairy products, fruits, timber, and vegetables. It is a junction on the main railway line from Durban to Swaziland and has an airfield. The Enseleni Nature Reserve, an area with a rich vegetation of wild figs, papyrus, and mangroves, is 9 miles (14 km) east of Empangeni. Pop. (1985) 11,403.

empathy, the ability to imagine oneself in another's place and understand the other's feelings, desires, ideas, and actions. It is a term coined in the early 20th century, equivalent to the German *Einfühlung* and modeled on "sympathy." The term is used with special (but not exclusive) reference to aesthetic experience. The most obvious example, perhaps, is that of the actor or singer who genuinely feels the part he is performing. With other works of art, a spectator may, by a kind of introjection, feel himself involved in what he observes or contemplates. The use of empathy is an important part of the counseling technique developed by the American psychologist Carl Rogers.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Empedocles (b. c. 490 BC, Acragas, Sicily—d. 430, the Peloponnese, Greece), Greek philosopher, statesman, poet, religious teacher, and physiologist.

According to legend only, Empedocles was a self-styled god who brought about his own death, as dramatized by the English poet Matthew Arnold in "Empedocles on Etna," by flinging himself into the volcanic crater atop Mount Etna to convince followers of his divinity. To his contemporaries he did indeed seem more than a mere mortal; Aristotle reputedly hailed him as the inventor of rhetoric, and Galen regarded him as the founder of Italian medicine. Lucretius admired his hexametric poetry. Nothing remains of the various writings attributed to him other than 400 lines from his poem *Peri phuseōs* ("On Nature") and fewer than 100 verses from his poem *Katharmoi* ("Purifications").

Although strongly influenced by Parmenides, who emphasized the unity of all things, Empedocles assumed instead that all matter was composed of four essential ingredients, fire, air, water, and earth, and that nothing either comes into being or is destroyed but that things are merely transformed, depending on the ratio of basic substances, to one another. Like Heraclitus, he believed that two forces, Love and Strife, interact to bring together and to separate the four substances. Strife makes

each of these elements withdraw itself from the others; Love makes them mingle together. The real world is at a stage in which neither force dominates. In the beginning, Love was dominant and all four substances were mixed together; during the formation of the cosmos, Strife entered to separate air, fire, earth, and water from one another. Subsequently, the four elements were again arranged in partial combinations in certain places; springs and volcanoes, for example, show the presence of both water and fire in the Earth.

Apparently a firm believer in the transmigration of souls, Empedocles declared that those who have sinned must wander for 30,000 seasons through many mortal bodies and be tossed from one of the four elements to another. Escape from such punishment requires purification, particularly abstention from the flesh of animals, whose souls may once have inhabited human bodies.

BIBLIOGRAPHY. Clara Elizabeth Millerd (Clara Elizabeth Millerd Smertenko), *On the Interpretation of Empedocles* (1908, reprinted 1980).

emperor, feminine **EMPRESS**, title designating the sovereigns of the ancient Roman Empire and, by derivation, various later European rulers; it is also applied loosely to certain non-European monarchs.

In republican Rome (c. 509–27 BC), *imperator* denoted a victorious general, so named by his troops or by the Senate. Under the empire (after 27 BC), it was regularly adopted by the ruler as a forename and gradually came to apply to his office.

In medieval times, Charlemagne, king of the Franks and of the Lombards, was crowned emperor by Pope Leo III in Rome on Christmas Day, 800. Thenceforward until the fall of Constantinople in 1453 there were two emperors in the Christian world, the Byzantine and the Western. The term "Holy Roman emperor" is now generally used, for convenience, to designate the Western sovereigns, though the title was at first simply "emperor" (*imperator*; the German form *kaiser* being derived from the Roman *caesar*), then "august emperor," then, from 971, "Roman emperor." The addition of "Holy" to the designation of the emperor, in historical writing, follows from its having been added to that of the empire (*sacrum imperium*, 1157).

The dissolution of Frankish Europe into separate kingdoms led eventually to the imperial title's passing in 962 to the East Frankish or German king Otto I, who was also king of Italy (the kingdom of Burgundy was further acquired by Conrad II in 1032). Thenceforward to 1806, though not all German kings were emperors (crowned by the pope), there were no emperors who were not German kings, so that election to the German kingship came to be *de facto* necessary for attainment of the imperial title—with the final result that from 1508 to 1806 the style "emperor elected" or, more briefly, "emperor" was given to the German king in anticipation of his coronation by the pope (only one such coronation, that of Charles V in 1530, actually took place in the period).

Outside the Frankish and German sphere of influence the title emperor was sometimes assumed by princes supreme over more than one kingdom: thus Sancho III the Great of Navarre styled himself "emperor of Spain" on his annexation of León (1034); Alfonso VI of León and Castile called himself "emperor of the Two Religions," to show his supremacy over Christians and Muslims alike; and Alfonso VII took the title "emperor of all Spain" (1135). The Russian tsar Peter I the Great assumed the title *imperator* on Oct. 22, 1721. From that point on male rulers were conventionally called tsar, whereas female rulers were always called empress; both males and females held both titles, i.e., tsar (or tsaritsa) and imperator (or imperatritsa).

After the French Revolution had destroyed the kingdom of France, Napoleon Bonaparte in 1804, having been anointed by Pope Pius VII, crowned himself emperor of the French as Napoleon I. His claim to be the successor not of Louis XIV but of Charlemagne, together with his organization of the Confederation of the Rhine in Germany, was a threat

to the Holy Roman Empire of the Habsburg dynasty. Seeing this, Francis II, to retain an imperial title, took that of "hereditary emperor of Austria" before he dissolved the old empire in 1806. His successors retained it until 1918.

Napoleon III was emperor of the French from 1852 until his deposition in 1870–71 (the French Second Empire). Between 1871 and 1918 the kings of Prussia—William I, Frederick III, and William II—were German emperors, or kaisers. Victoria of Great Britain took the title empress of India in 1876, but her great-grandson George VI renounced the imperial title when India became independent.

In the Western Hemisphere Jean-Jacques Dessalines was emperor of Haiti from 1804 to 1806; princes of the house of Bragança were emperors of Brazil from 1822 to 1889; Agustín de Iturbide and the Austrian archduke Maximilian were emperors of Mexico from 1822 to 1823 and from 1864 to 1867, respectively. The title emperor also is generally and loosely used as the English designation for the sovereigns of Ethiopia and of Japan, for the Mogul rulers of India, for the former sovereigns of China, for the Inca rulers of Peru, and for the Aztec rulers of Mexico.

Emperors, Five Good (ancient Rome): see Five Good Emperors.

empfindsamer Stil (German: "sensitive style"), also called **EMPFINDSAMKEIT** ("sensitivity"), important movement occurring in German instrumental music during the early 18th century and characterized by an emphasis upon the expression of a variety of deeply felt emotions within a musical work. This aesthetic is typical of an age that was much given to the expression of moving sentiments not only in art but in everyday life.

Closely allied with "sensitivity" was the desire to give a composition an aura of simplicity and naturalness, qualities highly prized in the philosophical outlook of the Enlightenment. The composers wanted to increase the effect of their music by imbuing each theme with a well-defined, even exaggerated, expressive character. Because the effect seemed to be considerably intensified by rapid changes of mood, phrases and sections of highly contrasting moods were placed in juxtaposition.

The most significant representatives of the *empfindsamer Stil* were Carl Philipp Emanuel Bach, Johann Joachim Quantz, Wilhelm Friedemann Bach, Johann Abraham Peter Schulz, and Jiri Antonin Benda.

emphysema, also called **PULMONARY EMPHYSEMA**, abnormal distension of the lungs with air. The air ducts and the air sacs, or alveoli, are distended and there is destruction of the partitions between alveoli and loss of alveoli. The exact cause and mechanism producing emphysema are not definitely known. It is most commonly associated with cigarette smoking and chronic bronchitis.

Lungs affected by emphysema show loss or degeneration of elastic tissue, disappearance of capillary walls, and breakdown of the alveolar walls. The air sac first stretches and then tends to disintegrate. The lung therefore becomes filled with large pools of air, and loss of elastic support around small airways, or associated loss of small airways themselves, severely interferes with expiration. The lung takes on a lace network, and the capillaries are greatly diminished, leaving the lung tissue dry and pale.

Some emphysema patients show a deficiency in a substance called antitrypsin; this substance normally counteracts the enzyme trypsin produced by bacteria that tends to degenerate tissue. An insufficient amount of antitrypsin gives even harmless bacteria an advantage and allows for possibly greater destruction.

The clinical manifestations are constant. There is severe breathlessness upon exertion, loss of weight, and swelling in the extremities; the skin takes on a bluish colour from lack of sufficient gas exchange; there is tightness in the chest; and the affected person wheezes and has an intolerance to sudden cold or smoky atmospheres. The chest may be noted to be held in the inspiratory position. The disease is one of the most common and crippling of respiratory diseases. There is no evidence that lung tissue destroyed by emphysema can be repaired.

Bullous emphysema is a variety of emphysema in which the distended alveoli actually form large air cysts on one or both of the lungs and occasionally rupture, causing lung collapse. When the blisters cause reduced heart or lung efficiency, they are sometimes removed by surgery.

emphyteusis and superficies, in Roman law, leases granted either for a long term or in perpetuity with most of the rights of full ownership, the only stipulation being that an annual rent be paid and certain improvements made to the property. Both originated in the early empire and were initially granted by the state, the former for agricultural purposes, the latter for building on land. The main purpose was to encourage individuals to develop land without the threat of removal once the development was finished. Even before the time of Hadrian (early 2nd century AD) the rights of *emphyteusis* and *superficies* began to be granted by private persons. They could be inherited, were transferable, and were protected in the courts. The basic principles and form of *emphyteusis* and *superficies* have survived in modern times in many civil-law countries.

Empire State Building, steel-framed 102-story building completed in New York City in 1931. It rises to a height of 1,250 feet (381 m) and was the first skyscraper of such great vertical dimension. It was the highest structure in the world until 1954. A 222-foot (68-metre) television antenna mast, added in 1950, increased its total height to 1,472 feet (449 m); the height was reduced to 1,454 feet (443 m) in 1985 when the old antenna was replaced. The building site is in midtown Manhattan, on Fifth Avenue at 34th Street.

Empire style, major phase of Neoclassical art that flourished in France during the time of the First Empire (1804–14). The Empire style was encouraged by Napoleon's desire for

a style inspired by the grandeur of imperial Rome. In architecture it was exemplified by such Parisian buildings and monuments as the Church of the Madeleine (originally the Temple of Glory) by Pierre-Alexandre Vignon, Jean Chalgrin's Arc de Triomphe de l'Étoile, and Charles Percier and Pierre Fontaine's Arc de Triomphe du Carrousel and Vendôme Column; in painting, by Jacques-Louis David's "Sacre de l'empereur Napoléon 1^{er} et couronnement de l'impératrice Joséphine dans la cathédrale Notre-Dame de Paris, 2 décembre 1804" and Baron Antoine Gros's battle scenes; and in sculpture, by Antonio Canova's heroic statues of Napoleon and his family. The Empire style in dress also found its inspiration in classical times, at once consciously emulating the rich elegance of pre-Revolutionary France, gowning women to emphasize femininity and grace, in flowing floor-length creations of light fabrics, frequently having trains, that were universally quite décolleté and girdled immediately beneath the breasts. Paris winters demanded warm outer garments, which were numerous and various, among them scarves, stoles, capes, jackets, and overdresses. Men's fashions of the Empire period featured a cutaway tailcoat revealing a waistcoat and high-collared shirt with cravat, much resembling the tailoring of London.

The French architects Charles Percier and Pierre Fontaine, who designed furnishings for the state rooms of Napoleon, contributed in great measure to the creation of the Empire style of interior decoration and furniture design. Their ideas were incorporated and propagated in their *Recueil de décorations intérieures* (1801 and 1812; "Collection of Interior Decoration"). The strong archaeological bias of the Empire style led to direct copying of classical types of furniture and accessories; to this was added a new repertory of Egyptian ornament, stimulated by Napoleon's campaigns in Egypt. Mahogany-veneered furniture with ormolu mounts assumed the shapes of Roman, Greek, and Egyptian chairs and tables with winged-lion supports and pilasters headed with sphinxes, busts, or palm leaves. Where no classical prototypes existed, contemporary designs were enlivened with ancient ornamental motifs, often with symbolic implications in reference to Napoleon's reign—*e.g.*, winged victory and the laurel wreath used as decorative symbols of triumph; bees, sheaves of grain, and cornucopias for prosperity; and fasces and sphinxes for conquest.

Although the Empire style began in France (specifically Paris), it quickly spread throughout Europe, with each country adapting it to its own national taste. *See also* Biedermeier style; Greek Revival; and Regency style.

Empiricism (from Greek *empeiria*: "experience"), in philosophy, an attitude expressed in a pair of doctrines: (1) that all concepts are derived from the experience to which they are applied; and (2) that all knowledge of matters of fact is based on, or derived from, experience. Accordingly, all claims to knowledge of the world can be justified only by experience.

A brief treatment of Empiricism follows. For full treatment, *see* MACROPAEDIA: Philosophical Schools and Doctrines.

Empiricism argues that knowledge derived from a priori reasoning (involving definitions formed or principles assumed) either does not exist or is confined to "analytical" truths, which have no content, deriving their validity merely from the meanings of the words used to express them. Hence a metaphysics that seeks to combine the a priori validity of logic with a scientific content is impossible. Likewise there can be no "rational" method; the nature of the world cannot be discovered through pure reason or reflection.

In practice three different types of Empiricism are recognized, depending on the degree to which adherents admit a priori concepts or propositions. Absolute Empiricists admit neither a priori concepts nor a priori propositions, although they may recognize such analytical a priori truths as tautological definitions. Substantive Empiricists distinguish between formal and categorial a priori concepts. The existence of formal a priori concepts is admitted, provided such formal concepts are confined to the way ideas interact; categorial a priori concepts such as causation are denied. Substantive Empiricists argue that every a priori proposition is virtually a tautology, although it may take deduction to reveal this. Partial Empiricists claim that certain non-formal ideas may be a priori. Examples include the concepts of natural cause and effect, morality, etc. After granting this, however, the Partial Empiricist verifies everyday propositions about matters of fact by empirical means.

Historically, the first Western Empiricists were the ancient Greek Sophists, who concentrated their philosophical inquiries on such relatively concrete entities as man and society, rather than the speculative fields explored by their predecessors. Later ancient philosophers with Empiricist tendencies were the Stoics and the Epicureans, although both were principally concerned with ethical questions.

The majority of Christian philosophers in the Middle Ages were Empiricists. A notable thinker of the 14th century, for example, was William of Ockham, who argued that all knowledge of the physical world is attained by sensory means. In the 16th century another English Empiricist, Francis Bacon, believed in building up observed data about nature so as to arrive at an accurate picture of the world. To this extent he laid the foundations of the scientific method. John Locke in the 17th century was probably the leading Empiricist of the late- to post-Renaissance era. Later philosophers who subscribed to some degree of Empiricism included the Irish-born Bishop George Berkeley in the 17th and 18th centuries, the Scot David Hume in the 18th century, and the Britons John Stuart Mill and Bertrand Russell in the 19th and 20th centuries, respectively. Mill (who denied that he was an Empiricist) and Russell on occasion even claimed that mathematical truths or logical concepts are essentially Empirical.

The antithetical position to that of Empiricism in philosophical arguments over theories of knowledge has usually been the Rationalist one. Discussion centres on the extent to which concepts are innate or acquired.

Another group of Empiricists, but one that operated outside the Anglo-Saxon tradition, consisted of the Logical Positivists of the Vienna Circle. Logical Positivists hold that metaphysical statements are meaningless because they are inherently unverifiable.

The following ideas may be attributed to Empiricist influence, although not all of them need be held by any particular Empiricist thinker: (1) Experience is intelligible in isolation, or atomistically, without reference to the nature of its object or to the circumstances of its subject. Hence an experience can be described without saying anything about the mind that has it, the thoughts that describe it, or the world that contains it. (2) The person who undergoes experience is in some sense the recipient of data that are imprinted upon his intelligence irrespective of his activity; the person brings nothing to experience, but gains everything from it. (3) All method is scientific method. To discover the nature of the world it is necessary to develop a method of experiment whereby all claims to knowledge are tested by experience, since nothing but experience can validate them. (4) Reductionism: All facts about the world can be reduced to what are facts inasmuch as experiences con-

firm claims to knowledge as facts; hence no claims to knowledge of a transcendental world can have any foundation.

Empiricism's influence may be seen in the broad thesis of Nominalism, according to which reality is held to reside in the particular rather than in the universal. Nominalists argue that the whole has no reality that is not derived from that of its parts.

In the metaphysical sphere Empiricism generates a characteristic view of causation, seemingly an almost inevitable consequence of the Empiricist theory of knowledge. According to Empiricist metaphysics the world consists of a set of contingently connected objects and situations, united by regularities rather than necessities, and unrelated to any transcendental cause or destiny. Science, according to this view, investigates connections, and its aim is to make predictions on the basis of observed regularities. Furthermore, judgments of value have no place in science, say the Empiricists, as such judgments are subjective preferences of the investigator.

empiricism, radical (philosophy): *see* radical empiricism.

employee training, also called **JOB TRAINING**, or **OCCUPATIONAL TRAINING**, vocational instruction for employed persons.

During and after World War II, in-service training by employers became a common practice. The rapid changeover in industry from peace to war led to training schemes for semiskilled workers, for workers transferred to new jobs, and for women newly brought into industry. Thereafter, the rapid contemporary advance of technological change made training a necessity in almost all walks of life. At the operating level in industry and in public utilities, new techniques, new methods, new tools, new synthetics, new sources of power, and increased uses of automation have brought extensive changes in the past decades, and the rate of change tends to increase as time goes on. Comparable changes are taking place in the office with the extended use of computers and data processors, which provide for the storing and recall of information in amounts unknown 20 years ago.

All of this brought about a new approach to training. Great emphasis is now placed on a good start through initial job training, supplemented by orientation sessions or by attractively produced printed material describing the nature and objectives of the employment and the conditions of work. Since changes are frequent with technological advances, refresher training has become common in clerical as well as in industrial work.

For the more technical skills, it is quite common in the United States for the large employer to make arrangements with a university to set up special courses; in Great Britain it is more usual to encourage employees to attend regular class facilities to obtain technical certificates. Sometimes this is achieved by "sandwich" training, periods on the job alternating with periods at a technical institute. Many employers encourage further education by paying tuition fees or by allowing free time to attend classes. Some very large corporations have developed their own systems of technical classes, supplementary to direct job training.

This widespread interest in training has led to considerable innovation in method. Formal lectures have given way to group discussion. The case-study method has become popular; a problem situation is presented in considerable detail and trainees are asked to make suggestions for its solution. Another new technique is role playing. Members of the training staff create a situation by playacting, and the trainees either comment on what is taking place or participate in the attempt to find a solution, or they perform functions or services in conditions that simulate their working environment. Attention also has been given to

audiovisual aids. Sensitivity training has been introduced to help individuals to study their own behaviour and reactions to one another by means of group discussion in which there is frank analysis of interrelationships between members of the group.

New industries have created new needs. The instruction of airline flight attendants has become a highly developed operation for the major airlines. Television- and sound-broadcasting organizations have introduced training schemes to improve the quality of their program services. At United Nations headquarters, a training scheme has been developed for the guides who conduct visitors around the building, including daily briefing on the international events on which they may be questioned.

Initiative in training lies with the organization rather than with industry, and the large corporation tends to develop a variety of training projects and adequate administration of training. In a large organization, the individual employee needs to be introduced to his task and to identify himself with it, so as not to be lost in its complexity, and he needs to have subsequent periods of training to keep abreast with developments. In small- and medium-sized concerns, some managements are interested in training, while some tend to regard it as a luxury. It is impossible to determine which industries give the most attention to formal training; it depends on the initiative of the management rather than on the nature of the work.

Corporation schools in the United States date from the 1890s; the National Association of Corporate Training was created in 1919. Training schemes also have been supported by professional groups, such as the International City Managers' Association, the Public Personnel Association, and the Council of State Governments. The Industrial Training Act, which came into force in Great Britain in 1964, provided for the establishment of an Industrial Training Board for each industry to make specific recommendations concerning the form and content of training courses and the standards to be set, and to recommend appropriate further education. By the 1990s it had been replaced with a network of 82 Training and Enterprise Councils in England and Wales and also of 22 Local Enterprise Companies in Scotland. These independent companies, operated by private business leaders, manage a variety of job-training programs on behalf of the British government.

With the rapid advances in technology and the growing complexity of business and industry, management training has become accepted as a necessity in both the public and private sectors. In the United States, graduate business education and senior executive training schemes, such as the advanced management program for senior executives at the Harvard Graduate School of Business Administration, were already well established in the immediate postwar period. In Great Britain the Administrative Staff College (now Henley Management College) was set up at Henley-on-Thames in 1945 to offer short courses in problems of advanced management. It employs a novel technique of training by group initiative, drawing its inspiration from the professional experience of the participants. It has been copied successfully in several other countries. Individual corporations have also established institutions of their own for the development of general management techniques at senior levels.

The training of government staff varies considerably in terms of different national traditions of administration and education. Full-scale training of civil servants began in many Western countries in the decades after World War II. The most important development was perhaps the founding in 1945 of the National School of Administration in Paris, which

serves as both a professional school and a recruitment agency for the French government's administrative and diplomatic services. Great Britain, India, and other countries have developed their own schools to train civil servants.

The less-developed countries have unique problems of employee training, their economic advance depending largely on the introduction of new and unfamiliar techniques. Training organization is needed in basic skills, both industrial and clerical, and for the provision of adequate quantities of trained technicians, supervisors, and competent managers. To achieve planned progress these nations need skilled administrators in large numbers, and above all they require educators and instructors. In some, the primary and higher educational structure is inadequate for current needs, no vocational training is built into the school system, and little or no science and technology are offered in the universities.

Inevitably they must send some of their key personnel for training abroad and call in foreign experts under one or another of the technical-assistance programs. But foreign experts cannot train workers for a whole industry or instruct the staff necessary to organize an entire national development program. They must concentrate first on building up local groups of indigenous experts, with aptitude for training others, organized if possible on an institutional basis.

The United Nations and its specialized agencies contribute to the development-training schemes in these countries, emphasizing development of institutional training. The Regional Economic Commissions have sponsored the establishment of regional institutes of economic development in Africa, Latin America, Asia, and East Asia and have encouraged schemes for training in statistics to provide a sound basis for development planning. A particularly successful project is the Institute of Public Administration in Costa Rica, whose task is to train the staff necessary to administer the coordinated regional economic development of Central America. Eleven former French-African territories have established national schools of administration, noticeably influenced by the school in Paris.

Perhaps the most intractable problem associated with training is its evaluation. Its actual cost may be calculated in terms of the expenses of its administration and the salary costs of both the training staff and of the trainees while they are on nonproductive work. But the quality and ultimate success can be determined only by a value judgment on whether the effort seems justified as conducive to greater overall efficiency and to more successful operations. Craft skills and routine occupational skills can be measured by tests based on agreed standards, but occupations measurable in this way account only for a limited range of training activities. In the office, typing and shorthand work can be tested for speed and accuracy, but a great deal of clerical work cannot be analyzed statistically. Supervision, management, and administrative tasks depend on personal capability as much as they do on knowledge and experience. Knowledge can be imparted and experience acquired; the guided development of personality is more difficult. How far the training opportunities offered to a senior executive during his career have helped his professional development cannot be mathematically assessed.

Empoli, town, Firenze (Florence) *provincia*, Toscana (Tuscany) *regione*, north-central Italy, on the lower Arno River. During the medieval Florentine wars, Empoli was the scene of the Ghibelline congress of 1260, where Farinata degli Uberti successfully opposed the

destruction of defeated Florence, an episode referred to in Dante's *Inferno*. The painter Iacopo Chimenti da Empoli and the composer Ferruccio Busoni were born at Empoli, which is just south of Vinci, the birthplace of Leonardo da Vinci. An industrial target in World War II, the town was heavily damaged by Allied bombing but has been rebuilt. The collegiate church (1093) contains paintings by Francesco Botticini and terra-cottas by Luca Della Robbia. Empoli also has a museum of Tuscan art. The city's varied industries include the manufacture of glass, textiles, and matches. Pop. (1993 est.) mun., 43,563.

Emporia, city, seat of Lyon county, east-central Kansas, U.S. It lies between the Cottonwood and Neosho rivers. Established in 1857 by a town company and named after the ancient city in North Africa, the settlement developed as a trading centre after the arrival of the railroad in 1869. Severe droughts that plagued the city were ended in 1938 with the damming of the Kahola valley. *The Emporia Gazette* became probably the best known and respected "small-town" newspaper in the United States under the editorship of William Allen White, who bought it in 1895. After his death in 1944, the paper was edited by his son, William L. White. The city is now the trading and shipping centre of a large farming and dairying area and is the seat of Emporia State University (founded 1863). Inc. 1870. Pop. (1992 est.) 24,936.

empress: *see* emperor.

Empson, Sir Richard, Empson also spelled EMSON (b. Towcester, Northamptonshire, Eng.—d. Aug. 17, 1510, London), English lawyer and minister of King Henry VII, remembered, with Edmund Dudley, for his unpopular administration of the crown revenues.

Empson studied law in the Middle Temple and from 1475 held posts in Northamptonshire and then in Lancaster. From March 1486 Henry VII began to reward him with grants of stewardships and wardships. In 1491 Empson, one of the members of Parliament for Northamptonshire, was chosen speaker of the House of Commons. From 1494 Empson was sometimes styled "king's councillor" and, after becoming chancellor of the duchy of Lancaster in 1504, was knighted; Henry VII then joined him and Edmund Dudley by act of Parliament to the fellows responsible for carrying out his will. From that time these men were closely associated in carrying out the king's legal and financial policy, which made them so unpopular. The death of Henry VII left them without a protector, and they were arrested in April 1509, on Henry VIII's accession. Empson was sent to Northampton, where he was tried on a charge of constructive treason and convicted. He was brought back to London and executed.

Empson, Sir William (b. Sept. 27, 1906, Hawdon, Yorkshire, Eng.—d. April 15, 1984, London), British poet and critic known for his immense influence on 20th-century literary criticism and for his rational, metaphysical poetry.

Empson was educated at Winchester College and at Magdalene College, Cambridge. He earned degrees in mathematics and in English literature, which he studied under I.A. Richards. His first poems were published during this time. Several of the verses published in Empson's *Poems* (1935) also were written while he was an undergraduate and reflect his knowledge of the sciences and technology, which he used as metaphors in his largely pessimistic assessment of the human lot. Much influenced by John Donne, the poems are personal, politically unconcerned (despite the preoccupation with politics in the 1930s), el-

liptical, and difficult, even though he provided some explanatory notes.

Seven Types of Ambiguity (1930; rev. ed. 1953), one of the most influential critical works of the first half of the 20th century, was essentially a close examination of poetic texts. Empson's special contribution in this work was his suggestion that uncertainty or the overlap of meanings in the use of a word could be an enrichment of poetry rather than a fault, and his book abounds with examples. The book helped lay the foundation for the influential critical school known as the New Criticism. Empson applied his critical method to somewhat longer texts in *Some Versions of Pastoral* (1935) and further elaborated it in *The Structure of Complex Words* (1951). Empson's verbal analyses were based on the view that poetry's emotive effect derives primarily from the ambiguities and complexities of its cognitive and tonal meanings.

From 1931 to 1934 Empson taught English literature at the University of Tokyo, and he subsequently joined the English faculty of Peking National University in China. He was Chinese editor at the British Broadcasting Corporation during World War II and returned to teach at Peking National University from 1947 to 1952. Empson was professor of English literature at Sheffield University from 1953, becoming emeritus in 1971. He was knighted in 1979.

Empson's later criticism includes many uncollected essays and one book, *Milton's God* (1961). He was also a distinguished poet who influenced younger poets in the 1950s. His *Poems* appeared in 1935, *The Gathering Storm* in 1940, and his *Collected Poems* in 1955. Empson's poetry is characterized by ingenious conceits using a subject matter drawn from astrophysics, mathematics, and other sciences. A critical study of Empson's work is *William Empson: The Man and His Work* (1974), edited by Roma Gill.

emptiness, also called NOTHINGNESS, or VOID, in mysticism and religion, a state of "pure consciousness" in which the mind has been emptied of all particular objects and images; also, the undifferentiated reality (a world without distinctions and multiplicity) or quality of reality that the emptied mind reflects or manifests. The concept, with a subjective or objective reference (sometimes the two are identified), has figured prominently in mystical thought in many historical periods and parts of the world. The emptying of the mind and the attainment of an undifferentiated unity is a theme that runs through mystical literature from the *Upaniṣads* (ancient Indian meditative treatises) to medieval and modern Western mystical works. The concepts of *hsü* (*q.v.*) in Taoism, *sunyata* (*q.v.*) in Mahāyāna Buddhism, and the *En Sof* in Jewish mysticism are pertinent examples of "emptiness," or "holy Nothing," doctrines. Buddhism, with its basic religious ultimate of Nirvāṇa (*q.v.*), as well as its development of the *sunyata* doctrine, has probably articulated emptiness more fully than any other religious tradition; it has also affected some modern Western considerations of the concept. A good deal of 19th–20th century Western imaginative literature has been concerned with emptiness, as has a certain type of Existentialist philosophy and some forms of the Death of God movement. The particular meanings of "emptiness" vary with the particular context and the religious or cultural tradition in which it is used.

Empty Quarter (Saudi Arabia): *see* Rub' al-Khali.

empyema, accumulation of pus in a cavity of the body, usually in the pleura, which are the serous membranes covering the lungs.

Empyema is usually the result of a microbial, usually bacterial, infection in a body cavity. Thoracic empyema is characterized by chest pain, fever, coughing, and weight loss, and the presence of fluid as ascertained by a chest X ray. Treatment is directed at drainage of small amounts of pus through a needle or larger amounts through a drainage tube. In addition to drainage, antibiotics are often used to treat the underlying infection. Empyemas may result from the infection of an obstructed gall-bladder with a bacterial organism, in which case the high risk of perforation and systemic infection requires the immediate removal of the infected organ.

Ems River, Dutch EEMS, river, northwestern Germany. It rises on the south slope of the Teutoburger Forest and flows generally northwest and north through the *Länder* of North Rhine-Westphalia and Lower Saxony to the east side of the Dollart (baylike enlargement of its estuary), immediately south of Emden. It flows around the island of Borkum after passing through the Dollart on its way to the North Sea. There is a marked winter maximum and summer minimum flow. The Ems is 230 miles (371 km) long.

Between 1892 and 1899 the river was canalized to connect it with the Dortmund-Ems Canal in order to provide a German waterborne outlet for the Ruhr industrial district. There are also connections with the Rhine-Herne Canal and the Mittelland Canal system. Traffic northward on the canal system is mostly in coke and coal from the Aachen and Ruhr coalfields; southward, the traffic consists chiefly of imported raw materials and foodstuffs.

Ems telegram, report of an encounter between King William I of Prussia and the French ambassador; the telegram was sent from Ems (Bad Ems) in the Prussian Rhineland on July 13, 1870, to the Prussian chancellor, Otto von Bismarck. Its publication in a version edited by Bismarck so as to purposely offend the French government precipitated the Franco-German War.

Early in July, the candidacy of Prince Leopold of Hohenzollern-Sigmaringen, a relative of the Prussian king, for the Spanish throne had alarmed the French, who feared that the extension of Prussian influence into Spain would threaten France. Leopold's candidacy was withdrawn on July 12; the following day, the French ambassador to Prussia, Count Vincent Benedetti, approached King William at Ems to request an assurance that no member of his family would again be a candidate for the Spanish throne. The king politely refused Benedetti's demand, and their discussion ended.

A telegram describing the incident was sent to Bismarck. Bismarck's edited version, which he published the next day, omitted the courtesies in the two men's exchange and instead made it seem that each man had insulted the other. This touched off an intensified demand for war in Paris and Berlin, and France declared war on July 19. The incident provided the excuse for a trial of strength that was sought by both France and Prussia, but because of Bismarck's dishonest editing of the Ems telegram, it was France that was the first to declare war. This circumstance helped enlist the southern German states to Prussia's side in the ensuing war, which resulted in the unification of all the German states (except Austria) into modern Germany.

Ems-Weser-Elbe Canal (Germany): *see* Mittelland Canal.

Emser, Hieronymus (b. March 16/26, 1478, Ulm [Germany])—d. Nov. 8, 1527, Dresden, Saxony [Germany]), German theologian, lecturer, editor, and essayist who is remembered chiefly for his long public controversy with Martin Luther at the onset of the Reformation.

Emser studied humanities at the University of Tübingen and jurisprudence and theology at the University of Basel. In 1504 he lectured on classics at Erfurt (where Luther may have been among his listeners) and became secretary to Duke George of Saxony. He was ordained a priest c. 1512.

Emser first sided with the Reformers, but he desired a practical reformation of the clergy without any doctrinal breach with the past or with Rome. His liberal sympathies were mainly Humanistic. The radical opinions expressed by Luther at the theological disputation before notables of church and state at Leipzig (1519) brought their relationship to an open break.

In the ensuing bitter controversy (which lasted until his death), Emser wrote eight polemical tracts (1520–21). He also entered into a controversy with Huldrych Zwingli, the most influential figure in the Swiss Reformation.

In 1527 Emser published a German translation of the New Testament, from the Vulgate, with annotations. It was meant to counter Luther's own translation, but it remained essentially a revision of Luther's work. Nevertheless, by the end of the 18th century Emser's translation had gone through more than 100 editions.

Emsland, region along the lower Ems River, in Lower Saxony *Land* (state), northwestern Germany. It lies on both sides of the river, from the town of Lingen to the Ems estuary. Comprising a belt about 60 miles (100 km) long from south to north and 6–9 miles (10–15 km) wide, it includes three strips of land: the bog of the Bourtanger Moor, which stretches across the Dutch border; a narrow adjoining strip of better-drained, sandy soil containing the main villages; and the drained meadowland of the Ems River floodplain. Oil-bearing beds in the region lie at depths of 1,300–2,800 feet (400–850 m) and have yielded considerable quantities of petroleum; an oil-refining industry has consequently developed in Ems. Although peat bog still covers large areas, much of it has been reclaimed since 1928 by drainage, removal of peat, and fertilization of the subsoil. Small agricultural holdings support rye and potato crops, and milk production is important as well. Tourism is also increasing in importance.

Emson, Sir Richard: *see* Empson, Sir Richard.

emu, flightless bird of Australia and second largest living bird: the emu is more than 1.5 m (5 feet) tall and may weigh more than 45

Emu (*Dromaius novaehollandiae*)
V. Serventy—Bruce Coleman Inc./EB Inc.

kilograms (100 pounds). The emu is the sole living member of the family Dromaiidae (or Dromiceidae) of the order Casuariiformes, which also includes the cassowaries.

The common emu, *Dromaius* (or *Dromiceus*) *novaehollandiae*, the only survivor of several forms exterminated by settlers, is stout bodied and long legged, like its relative the cassowary. Both sexes are brownish, with dark-gray head and neck. Emus can dash away at nearly 50 kilometres per hour (30 mph); if cornered they kick with their big, three-toed feet. Emus mate for life; the male incubates from 7 to 10 dark-green eggs, 13 centimetres (5 inches) long, in a ground nest for about 60 days. The striped young soon run with the adults. In small flocks emus forage for fruits and insects but may also damage crops. The peculiar structure of the trachea of the emu is correlated with the loud booming note of the bird during the breeding season. Three subspecies are recognized, inhabiting northern, southeastern, and southwestern Australia; a fourth, now extinct, lived on Tasmania.

emu-wren, any of the three species of the Australian genus *Stipiturus*, of the songbird family Maluridae. In these tiny birds the narrow, cocked tail consists of six wispy feathers—in quality, like the feathers of the emu. The most widespread species, the southern

Southern emu-wren (*Stipiturus malachurus*)
Painting by H. Douglas Pratt

emu-wren (*S. malachurus*), is streaked brown, with pale-blue throat in the male. Emu-wrens are shy inhabitants of wet and dry scrublands.

emulsifier, in foods, any of numerous chemical additives that encourage the suspension of one liquid in another, as in the mixture of oil and water in margarine, shortening, ice cream, and salad dressing. Closely related to emulsifiers are stabilizers, substances that maintain the emulsified state. The consistency of food products may also be improved by the addition of thickeners, used to add body to sauces and other liquids, and texturizers. This class of additives has a dual purpose: they make food more appetizing by improving appearance and consistency, and they augment keeping qualities (*i.e.*, extend shelf life).

A number of substances in this group are derived from algae, among them algin, carageenan, and agar (*q.v.*). Lecithins, are also used as emulsifying agents (*see* lecithin).

Emulsifiers, stabilizers, and related compounds are also used in the preparation of cosmetics, lotions, and certain pharmaceuticals, where they serve much the same purpose as in foods—*i.e.*, they prevent separation of ingredients and extend storage life.

emulsion, in physical chemistry, mixture of two or more liquids in which one is present as

droplets, of microscopic or ultramicroscopic size, distributed throughout the other. Emulsions are formed from the component liquids either spontaneously or, more often, by mechanical means, such as agitation, provided that the liquids that are mixed have no (or a very limited) mutual solubility. Emulsions are stabilized by agents that form films at the surface of the droplets (*e.g.*, soap molecules) or that impart to them a mechanical stability (*e.g.*, colloidal carbon or bentonite). Unstable emulsions eventually separate into two liquid layers. Stable emulsions can be destroyed by inactivating or destroying the emulsifying agent—*e.g.*, by adding appropriate third substances or also by freezing or heating. Some familiar emulsions are milk (a dispersion of fat droplets in an aqueous solution) and butter (a dispersion of droplets of an aqueous solution in fat).

Emulsions are important in many fields—*e.g.*, in the dyeing and tanning industries, in the manufacture of synthetic rubber and plastics, in the preparation of cosmetics such as shampoos, and of salves and therapeutic products.

The term emulsion is often applied to mixed systems that should better be characterized as solutions, suspensions, or gels. For example, the so-called photographic emulsion is actually a gelatin gel in which tiny crystals (*e.g.*, of silver bromide) are dispersed.

Emydidae, family of hard-shelled turtles native to both the Old and New Worlds, primarily in the Northern Hemisphere. The emydid turtles comprise more than 25 genera and 85 living species—roughly one-half of all the genera and one-third of all the species of turtles now living. With the exception of a few terrestrial forms, such as the box turtles (*Terrapene*) of North and Central America, emydid turtles are aquatic reptiles with streamlined shells. Some, such as the diamondback terrapin, are valued as food; others are kept as pets.

The majority of emydid turtles are native to Asia and North and Central America. The most widely known members of the family include Blanding's turtle, box turtle, chicken turtle, painted turtle, pond turtle, spotted turtle, terrapin, and wood turtle. The family Emydidae has been placed by some authorities as the subfamily Emydinae of the family Testudinidae (usually restricted to the land tortoises).

'En Gedi, also spelled EIN GEDI, oasis, archaeological site, and kibbutz (communal settlement) in southeastern Israel on the west bank of the Dead Sea. Because of its spring in an otherwise totally arid country, the site has been inhabited from remote antiquity. Excavations in the 1960s and early 1970s at an adjoining tell (stratified mound) revealed remnants of a sanctuary of the Chalcolithic period (4th millennium BC), and evidences of continuous habitation from the 7th century BC through Byzantine times. The kibbutz, established in 1953, raises dates, bananas, and early vegetables. The area around 'En Gedi, with its unusual tropical vegetation, is an Israeli nature reserve; tourism is popular.

en résille, in the decorative arts, technique of enamelwork in which the design is incised on rock crystal or glass paste and the incisions lined first with gold and then with opaque or translucent enamel. After low-temperature firing, the surface is filed and polished. The term *résille*, French for hairnet, suggests the highly intricate and delicate designs and patterns usually executed in this technique, as well as the exquisite craftsmanship the process requires. In appearance, *en résille* work resembles cloisonné, except that its base is crystal or glass, not metal, and its effect is more delicate. Used to decorate jewelry, hand mirrors, and various trinkets and curios, *en résille* was

Case for a miniature portrait, *en résille* enamel, French, early 17th century; in the Victoria and Albert Museum, London

especially popular in 16th- and 17th-century western Europe.

Enakievo (city, Ukraine): *see* Yenakiyevo.

enamel, in anatomy, the hardest tissue of the body, covering part or all of the crown of the tooth in mammals. Enamel, when mature, consists predominantly of apatite crystals containing calcium and phosphate. Enamel is not living and contains no nerves. The thickness and density of enamel vary over the surface of the tooth; it is hardest at the biting edges, or cusps. The enamel of primary teeth is less hard than and only half as thick as that of permanent teeth. Normal enamel may vary in colour from yellow to gray. The surface enamel is harder and less soluble and contains more fluoride than the underlying enamel and is very resistant to caries (*q.v.*; tooth decay). Two major malformations of enamel may occur: (1) hypoplasia, in which the amount of matrix is insufficient, so that there is a lack of enamel; this may result from infection or malnutrition during development or, in rare instances, from genetic anomaly; (2) hypocalcification, in which there is insufficient calcium and a soft enamel is produced; this may result, for example, from excess fluorine in the diet. *See also* cementum; dentine.

enamel miniature, portrait on a small opaque, usually white, enamel surface an-

"Admiral Churchill," enamel miniature by Charles Boit, c. 1705; in the National Maritime Museum, Greenwich, Eng.

nealed to gold or copper plate and painted with metallic oxides. Since the pigments used are not vitreous enamels, this is not a true enamelling process. The metallic paints are slightly fused to the enamel surface through heating. After cooling, the completed picture is covered with a transparent vitreous enamel and heated again to give the image a glazed appearance.

The technique of making enamel miniatures was introduced in the 17th century by Jean and Henri Toutin. The first major artist working in this technique was Jean Petitot, who in the 17th century painted portrait miniatures for the courts of Charles I of England and Louis XIV of France (see Petitot, Jean).

In the early 18th century the enamel miniature enjoyed the greatest popularity among English patrons. The Swedish-born Charles Boit produced works in this medium in London for William III and Queen Anne. The German-born Christian Friedrich Zincke painted most of the English celebrities of the mid-18th century in enamels of remarkably even quality. The widespread European popularity of the miniature portrait painted on ivory brought about the decline of the enamel miniature in the second half of the 18th century, although the art continued to be practiced in England into the 19th century by such accomplished miniaturists as Henry Bone and William H. Craft (see Bone, Henry).

enamelling, porcelain: see porcelain enamelling.

enamelwork, technique of decoration whereby metal objects or surfaces are given a glasslike glaze that is fused onto the surface by intense heat to create a brilliantly coloured decorative effect. It is an art form noted for its brilliant, glossy surface, which is hard and long lasting.

A brief account of enamelwork follows. For full treatment, see MACROPAEDIA: Decorative Arts and Furnishings.

Enamelwork as a decorative art has affinities with inlay, mosaic, and painting. Objects most suitable for enamelling tend to be those that are delicate and small in scale. The technique is particularly well suited to the decoration of small, precious luxury objects, such as jewelry, snuffboxes, scent bottles, watches, and ecclesiastical objects. It is not, however, necessarily limited to such use.

Enamel itself is a comparatively soft glass. Various colours are obtained by adding metal oxides of various colours to the base enamel, called flux, or frit. By varying the proportions of different components, different colours are created. The best and most strikingly vivid colours tend to be the blues and greens, formed by adding an oxide of copper to the enamel flux. The enamel can be made more or less translucent or opaque by varying the components used.

Wet powder is spread onto the prepared metal surface of the object to be decorated and then allowed to dry before being heated, or fired, in a furnace. The heat causes the enamel to melt and to fuse with its metal base and to form the hard vitreous surface characteristic of enamelwork. The temperature at which the enamel is fired and, in particular, its consistency throughout the period of firing is crucial and will greatly affect the aesthetic properties and technical quality of the finished work.

There are many different techniques of enamelwork and an especially large variety of methods whereby the powdered enamel can be applied to the metal base. Various metals can be decorated with enamelwork, but the most common are copper, brass, bronze, and gold.

Two of the best known techniques are cloisonné and champlevé. In both of these processes, the design is delineated by an outline of metal within which the enamels are applied. In cloisonné work, thin strips of metal are soldered to the metal base to outline the design. In champlevé work, the base metal surface is cut away and the enamel is applied to the recesses so created, leaving the metal outline at surface level. In painted enamelwork, the colours are not separated by metal strips, and so the effect is less like that of a miniature stained-glass window and more like that of an oil painting.

Enamelwork may have existed as early as the 13th to the 11th century BC in Myce-

Painted enamel and copper pyx, Venetian, 15th century; in the Bargello, Florence
SCALA—Art Resource

naean civilization. It was certainly known to the Celts and the Romans. It reached its first real peak as a decorative art in the Byzantine Empire, during which time remarkable cloisonné works on gold were made. It flourished throughout medieval and Renaissance Europe. Particularly fine work was done around the year 1200 in Limoges, Fr.

In the 17th century, French craftsmen, led by Jean I Toutin of Chateaudun, invented a type of enamel miniature painting. The technique of transferring a design onto an enamelled box was perfected at Battersea, Eng., in the mid-18th century.

Precious objects of gold, enamel, and jewels were among the highly prized exquisite objects made by the Russian jeweller Carl Fabergé at the turn of the 20th century. Enamelwork has a long tradition in China and Japan as well, but it is almost certain that the technique was originally introduced to China (and then to Japan) from Europe. Particularly fine cloisonné enamels, especially vases, were made in China during the Ming dynasty. In the late 19th century, Japanese craftsmen perfected a "lineless" cloisonné technique in which the brilliant colours characteristic of cloisonné work could be produced without the usual lines formed by the metal strips.

enantiomorph (from Greek *enantios*, "opposite"; *morphe*, "form"), also called ANTIMER, or OPTICAL ANTIPODE, either of a pair of objects related to each other as the right hand

is to the left, that is, as mirror images that cannot be reoriented so as to appear identical. An object that has a plane of symmetry cannot be an enantiomorph because the object and its mirror image are identical. Molecular enantiomorphs, such as those of lactic acid, have identical chemical properties, except in their chemical reaction with other dissymmetric molecules and with polarized light. Enantiomorphs are important to crystallography because many crystals are arrangements of alternate right- and left-handed forms of a single molecule. A complete description of the crystal specifies how the forms are mixed with each other.

An example of a pair of substances that are enantiomorphs is the two optically active forms of tartaric acid, designated as *d*-tartaric acid and *l*-tartaric acid. The configurations of the individual molecules of these two substances have been shown to be mirror images of one another, as represented by the following projection formulas:

d-tartaric acid

l-tartaric acid

The two acids have identical melting points, densities, and solubilities in optically inactive solvents and the same rates of reactions with optically inactive reagents.

energite, sulfosalt mineral, copper arsenic sulfide (Cu_3AsS_4), that is occasionally an important ore of copper. It occurs as heavy, metallic-gray crystals and masses in veins and replacement deposits. Economically valuable deposits have been found in the Balkans; at several places in Peru; Chuquicamata, Chile; and Butte, Mont. It forms orthorhombic crystals. For detailed physical properties, see sulfosalt (table).

Encamp, village, Andorra, on a headstream of the Riu (river) Valira. Its agricultural economy is supplemented by tourism, especially skiing. Encamp has a broadcasting transmitter of Radio Andorra. Above the village is Engolasters Lake, accessible by cable car. There are facilities for generating hydroelectric power. In the locality is the Pic (peak) des Pessons (9,400 ft [2,865 m]). Pop. (1990) 7,489.

Encarnación, formerly ITAPÚA, city, southeastern Paraguay. The city was founded in 1614 on the west bank of the Upper Paraná River, opposite Posadas, Arg., to which it is linked by a bridge completed in 1987. Severely damaged by a tornado in 1926, it is now one of the largest cities of Paraguay and a busy commercial, manufacturing, and communications centre. The city is divided into two sectors: the High (old) City and the Low (new) City. The High City contains the church, the municipal offices, the courts, a baccalaureate college, a teachers college, commerce schools, and the principal residences. In the Low City are located the post office, various houses of commerce, factories, hotels, a branch of the Bank of Paraguay, and a radio and television station. It processes lumber, maté (tea), tobacco, cotton, corn (maize), rice, and cattle from the hinterland. Goods are shipped by highway or railway to Asunción or to Posadas via the bridge. Another highway leads northeast to Puerto Presidente Stroessner and thence to Iguacu Falls; there is also an airport. Pop. (1990 est.) 44,064.

encaustic painting, painting technique in which pigments are mixed with hot, liquid wax. After all of the colours have been applied to the painting surface, a heating element is passed over them until the individual brush

or spatula marks fuse into a uniform film. This "burning in" of the colours is an essential element of the true encaustic technique. Encaustic wax has many of the properties of oil paint: it can give a very brilliant and attractive effect and offers great scope for elegant and expressive brushwork. The practical difficulties of using a medium that has to be kept warm are considerable, though. Apart from the greater sophistication of modern methods of heating and the use of resin (or oil for use on canvas), present-day technique is similar to that described by the 1st-century-AD Roman scholar Pliny the Elder. Encaustic painting was invented by the ancient Greeks and was brought to the peak of its technical

Mummy portrait of a young girl, encaustic painting from al-Fayyūm, Egypt, 2nd century; in the Louvre, Paris

Giraudon—Art Resource/EB Inc

perfection by the genre painter Pausias in the 4th century BC.

Enceladus, second nearest of the major regular moons of Saturn and the brightest of all its moons. It was discovered in 1789 by the English astronomer William Herschel.

Enceladus is about 500 km (310 miles) in diameter and orbits Saturn at a mean distance of 238,020 km (147,899 miles). Its average density—only 30 percent greater than that of water—indicates that it is at least half water ice. Its surface, which reflects essentially all of the light that strikes it, is basically smooth but includes cratered and grooved plains.

Images from the spacecraft Voyager 2 reveal that Enceladus is complex geologically, its surface having undergone five distinct evolutionary periods. Later observations by the Cassini spacecraft confirm that portions of the moon are geologically active today, with extremely high heat flow and associated eruptions of water vapour and ice from geysers (a form of ice volcanism) especially apparent in its south polar region. The moon's current activity is responsible for Saturn's E ring, a tenuous ring of water-ice particles condensed from vapour ejected by the geysers.

Enceladus's 33-hour trip around Saturn is one-half that of the more distant moon Dione; the two bodies are thus associated in an orbital resonance. Under certain circumstances, such a resonance can lead to large amounts of tidal heating of the inner of the involved moons, but how this process might work within Enceladus remains to be shown in detailed calculations.

Encephalartos, a genus of 20 or more species of palmlike cycads (plants of the family Cycadaceae), native to southern Africa and grown elsewhere as conservatory and house

Encephalartos

W.H. Hodge

plants. The genus includes both tuberous and columnar varieties; they sometimes have spiny foliage. A breadlike food is prepared from the starchy centre of the stem of the bread palm (*q.v.*; *E. caffer*).

encephalitis, plural ENCEPHALITIDES, inflammation of the brain; from Greek *enkephalos* ("brain") and *itis* ("inflammation"). In some cases, the inflammation affecting the brain may involve adjoining structures as well; there is inflammation of the brain and of the spinal cord in encephalomyelitis and of the brain substance and of the meninges (the membranes covering the brain) in meningoenkephalitis. Encephalitis is most often caused by the direct or indirect action of an infective organism and sometimes by such noninfective agents as chemicals. Although encephalitis can be produced by many different types of organisms, such as bacteria, protozoa, and helminths (worms), viruses are the most frequent causal agents. Encephalitis-producing viruses may be divided into two groups: (1) those that invade the body and produce no damage until they are carried by the bloodstream to the nerve cells of the brain, where they lodge and multiply (*i.e.*, rabies and arthropod-borne viruses); and (2) those that invade the body and first injure non-nervous tissues and then secondarily, and rarely, invade brain cells (*e.g.*, viruses causing herpes simplex, herpes zoster, dengue, and yellow fever).

The type of brain inflammation known as encephalitis lethargica, or sleeping sickness (to be distinguished from African sleeping sickness, or African trypanosomiasis), occurred in epidemics in Europe and in the United States about the time of World War I but has not been reported since 1930, though individuals with residual symptoms (postencephalitic Parkinsonism) may still be seen. Although the influenza virus was suspected, the cause of sleeping sickness was never established.

Among children, a large number of acute encephalitides are of the type known as demyelinating encephalitis, which may develop as a complication of such viral diseases as measles or chicken pox or as a result of vaccination against such viral diseases as smallpox. It is so-called because damage is not done to the nerve cell body but to the insulation (myelin sheath) surrounding the nerve fibres. Multiple sclerosis is the best known of another group of encephalitides in which there is injury to the myelin. Among the chemicals that occasionally produce encephalitis are lead, arsenic, mercury, ethyl alcohol, chlorinated hydrocarbons, morphine, and barbiturates.

Symptoms common to most types of encephalitis are fever, headache, drowsiness, lethargy, coma, tremors, and a stiff neck and back. Convulsions may occur in patients of any age but are most common in infants. Characteristic neurological signs include uncoordinated and involuntary movements, weakness of the arms, legs, or other portions of the body, or unusual sensitivity of the skin to various types of stimuli. The symptoms, signs, and an examination of the cerebrospinal fluid can usually establish the presence of en-

cephalitis, but they do not necessarily establish the cause, which often remains unknown. This situation makes specific treatment difficult, and even when the causative virus is known, there may be no drugs effective against it.

Generally, treatment aims to relieve the symptoms and ensure quiet rest for the patient. The symptoms remaining after recovery from the acute phase of brain inflammation vary considerably, depending on the type of encephalitis and on the age and general health of the patient. Many individuals are weak and debilitated after an attack but recover with no serious aftereffects. Some encephalitides (*i.e.*, Eastern and Western equine encephalitides, diseases of horses and mules that may be transmitted to humans by the mosquito) may cause irreparable brain damage in about 50 percent of the patients under one year of age. Any form of encephalitis in young children may damage the brain so that it can no longer develop properly.

encephalomyelitis, equine (animal disease): *see* equine encephalitis.

enchanter's nightshade, any herbaceous perennial plant of the genus *Circaea*, in the evening primrose family (Onagraceae), that occurs in damp woodlands of the Northern Hemisphere. The plants have slender stems with opposite leaves. The small, white, two-

Enchanter's nightshade (*Circaea lutetiana*)

petaled flowers grow in clusters, and the fruits have hooked bristles.

enchondroma, a solitary cartilaginous lesion that occurs mostly in the shafts of bones of the hands and feet, usually between adolescence and about age 50. Enchondromas are benign, slow-growing tumours. As they grow they expand and thin the cortex of the parent bone, producing considerable deformity. They may also erupt through their bony covering and project outward into the surrounding soft tissues. Enchondromas tend to be painless but are subject to sarcomatous change. They are usually treated by complete surgical excision. The solitary enchondroma is morphologically identical with the lesions produced in enchondromatosis (also called Ollier's disease).

Enciclopedia italiana di scienze, lettere ed arti (Italian: "Italian Encyclopaedia of Science, Letters, and Arts"), major encyclopaedia of Italy, containing 35 volumes of text and a one-volume index. Work on the encyclopaedia began in 1925, and the volumes were published serially from 1929 to 1936; appendixes have been published covering the years from 1937 to 1960.

The *Enciclopedia italiana* contains many excellent lengthy articles, usually signed with the initials of their authors, and thousands of illustrations.

Enciclopedia universal ilustrada europeo-americana, byname *ESPASA*, encyclopaedia published in Madrid, an outstanding reference work of 70 volumes—published between 1905 and 1933—plus a series of supplements.

Spanish and Spanish-American geography and gazetteer information are especially strong. Major articles—e.g., on countries—are quite long and include lengthy bibliographies of international scope. Although coverage is considered universal, the Iberian Peninsula and Latin America are particularly well covered. A volume devoted to Spain is separately revised and reissued approximately every 10 years.

Special features of *Espasa* include reproductions and descriptions of paintings and other works of art, entered under titles; colour plates, for each country, of uniforms, flags, and coins; geographical, historical, geological, and statistical maps; and city and town plans, even of obscure and remote places not usually available in guidebooks. *Espasa* also functions as a language dictionary, giving etymologies and word equivalents in French, Italian, English, German, Portuguese, Catalan, and Esperanto.

From 1934, a *suplemento anual* has been published at irregular intervals. It is arranged alphabetically in subject groups, e.g., Aeronautica, Agricultura, etc., with smaller topics included under these. In 1955 a miniature edition, entitled *Espasa-Calpe: diccionario enciclopédico abreviado*, was issued in a sixth edition of seven volumes.

Encina, Juan del (b. July 12, 1468?, Encinas?, near Salamanca, Castile—d. near the end of August 1529/30, León?, Spain), playwright, poet, priest, and composer of secular vocal music, who was the first Spanish dramatist to write specifically for performance.

After youthful training as a chorister at Salamanca cathedral (c. 1484) and at the University of Salamanca (before 1490), Encina entered the service of the Duke of Alba as a resident poet-dramatist-composer in 1492. He wrote for the court a number of *églogas* (short pastoral plays) incorporating music. Eight of his plays and most of his poetry were collected and published in *Cancionero* in 1496. Thereafter Encina lived much in Italy; he visited Rome at least three times, gaining various ecclesiastical posts and seeking the patronage of Pope Alexander VI, a Spaniard, in securing a position in Spain. In 1519 he journeyed to Jerusalem, later publishing an account of his pilgrimage. He was a prior at León from 1523 until his death.

The first half dozen of Encina's *églogas* are little more than dialogues in a humorously colloquial peasant speech between mock-realistic shepherds more interested in recreation than work. His later *églogas* introduce other types of characters and, although still rudimentary in plot, are more complex, refined, and sententious. These later plays, a notable example of which is *Égloga de Plácida y Vitoriano*, show the influence of the *églogas*' Italian antecedents in their celebration of pagan love and their incorporation of themes from classical mythology.

Encina was also a poet and composer of wide range; he wrote both popular ballads and *villancicos* (rustic songs) as well as skillfully phrased and polished courtly poems. Indeed, he is now considered one of the most important songwriters in Spain in his time. His songs were based upon folklike tunes and rhythms, and some of the most appealing of them have an earthy or ribald quality, while others achieve a rare intensity of expression.

Encke, Johann Franz (b. Sept. 23, 1791, Hamburg—d. Aug. 26, 1865, Spandau, Ger.), German astronomer who in 1819 established the period of the comet now known by his name (see Encke's Comet).

Encke was educated at Hamburg and the University of Göttingen, where he worked under the direction of Carl Friedrich Gauss. In 1816 Encke became assistant at the Seeberg Observatory near Gotha, Ger., where he was made vice director in 1820 and director in 1822. In 1825 he was appointed professor of astronomy and director of the observatory of the University of Berlin. There he planned and supervised the construction of a new observatory, completed in 1835.

Besides the comet that bears his name, Encke is also known for his discovery of Encke's Division, in the outermost ring of Saturn. From observations of the transits of Venus recorded in 1761 and 1769, he derived a value for the solar parallax (in effect, for the Sun's distance from the Earth) that, at 8".57, is close to the presently accepted figure. He also established methods for calculating the orbits of minor planets and orbits of double stars.

Enckell, Rabbe (Arnfinn) (b. March 3, 1903, Tammela, Fin.—d. June 17, 1974,

Enckell

By courtesy of the Embassy of Finland, Washington, D.C.

Helsinki), Finnish poet, playwright, and critic, a leading representative of the Swedo-Finnish poetic revival that began in the 1920s.

Enckell studied art in France and Italy. His first collection of impressionistic nature poems, *Dikter*, appeared in 1923. In this collection and a sequel, *Flöjtblåsarlycka* (1925; "The Flutist's Happiness"), Enckell describes with a painter's eye the exquisite nuances in the phenomena of nature. A modernist, he was associated with the avant-garde journal *Quosego* in 1928–29. After writing a few semi-autobiographical novels, including *Ljusdunkel* (1930; "Chiaroscuro"), Enckell returned to poetry with *Vårens cistern* (1931; "The Cistern of Spring"), followed by *Tonbrädet* (1935; "The Sounding Board"). His poetic diction became more modern and contained reminiscences of the work of T.S. Eliot. *Valvet* ("The Vault"), another collection of his poems, appeared in 1937.

A student of classical poetry and mythology, Enckell made use of classical parallels to dramatize the problems of his time in a series of verse plays including *Orfeus och Eurydike* (1938) and *Alkman* (1959). Enckell reflects upon this continuous preoccupation with the classical myths of Greece in his most remarkable collection of poetry, *Andedräkt av koppar* (1946; "Breath of Copper"). In 1960 he was made poet laureate of Swedish Finland.

Encke's Comet, faint comet having the shortest orbital period (about 3.3 years) of any known; it was also only the second comet (after Halley's) to have its period established. The comet was first observed in 1786 by Pierre Méchain. Johann Franz Encke in 1819 calculated that sightings of apparently different comets in 1786, 1795, 1805, and 1818 were in fact appearances of the same comet, whose short orbital period he was able to deduce. The comet was named in his honour, though usually comets are named after their discoverers. Encke also found the comet's period to be

decreasing by about 2½ hours in each revolution and showed that this effect could not be explained by perturbations (slight changes in an orbit) caused by planets. The shortening of its period continues, though at a reduced rate; the cause of this reduction is still uncertain.

enclosure, also spelled *INCLOSURE*, the division or consolidation of communal fields, meadows, pastures, and other arable lands in western Europe into the carefully delineated and individually owned and managed farm plots of modern times. Before enclosure, much farmland existed in the form of numerous, dispersed strips under the control of individual cultivators only during the growing season and until harvesting was completed for a given year. Thereafter, and until the next growing season, the land was at the disposal of the community for grazing by the village livestock and for other purposes. To enclose land was to put a hedge or fence around a portion of this open land and thus prevent the exercise of common grazing and other rights over it.

In England the movement for enclosure began in the 12th century and proceeded rapidly in the period 1450–1640, when the purpose was mainly to increase the amount of full-time pasturage available to manorial lords. Much enclosure also occurred in the period from 1750 to 1860, when it was done for the sake of agricultural efficiency. By the end of the 19th century the process of the enclosure of common lands in England was virtually complete.

In the rest of Europe enclosure made little progress until the 19th century. Agreements to enclose were not unknown in Germany in the 16th century, but it was not until the second half of the 18th century that the government began to issue decrees encouraging enclosure. Even then, little advance was made in western Germany until after 1850. The same policy of encouragement by decree was followed in France and Denmark from the second half of the 18th century, in Russia after the emancipation of the serfs (1861), and in Czechoslovakia and Poland after World War I. Common rights over arable land—which constitute the most formidable obstacle to modern farming—have now for the most part been extinguished, but some European land is still cultivated in the scattered strips characteristic of common fields, and common rights continue over large areas of pasture and woodland.

encomienda, in colonial Spanish America, legal system by which the Spanish crown attempted to define the status of the Indian population in its American colonies. It was based upon the practice of exacting tribute from Muslims and Jews during the Reconquista ("Reconquest") of Muslim Spain. Although the original intent of the *encomienda* was to reduce the abuses of forced labour (*repartimiento*) employed shortly after the discovery of the New World, in practice it became a form of enslavement.

As legally defined in 1503, an *encomienda* (from *encomendar*, "to entrust") consisted of a grant by the crown to a conquistador, soldier, official, or others of a specified number of Indians living in a particular area. The receiver of the grant, the *encomendero*, could exact tribute from the Indians in gold, in kind, or in labour and was required to protect them and instruct them in the Christian faith. The *encomienda* did not include a grant of land, but in practice the *encomenderos* gained control of the Indians' lands and failed to fulfil their obligations to the Indian population. The crown's attempts to end the severe abuses of the system with the Laws of Burgos (1512–13) and the New Law of the Indies (1542) failed in the face of colonial opposition and, in fact, a revised form of the *repartimiento* system was revived after 1550.

The *encomienda* was designed to meet the needs of the colonies' early mining economy. With the catastrophic decline in the Indian population and the replacement of mining activities by agriculture, the system lost its effectiveness and was gradually replaced by the hacienda (*q.v.*) system of landed estates. The *encomienda* was not officially abolished, however, until the late 18th century. *See also* repartimiento.

Encratite, member of an ascetic Christian sect led by Tatian, a 2nd-century Syrian rhetorician. The name derived from the group's doctrine of continence (Greek: *enkrateia*). The sect shunned marriage, the eating of flesh, and the drinking of intoxicating beverages, even substituting water or milk for wine in the Eucharist.

Tatian converted to Christianity while studying in Rome under the Christian apologist Justin Martyr. He early showed his ascetic bent, and, after Justin's martyrdom (c. AD 165), Tatian drifted further toward dualism and Gnosticism, severed his ties with the church, and returned to Syria, where his association with the Encratites began. He formulated the doctrine that denied salvation to Adam, and he reinterpreted some of the Pauline texts of the New Testament (e.g., 1 Corinthians 7:3–6) to make them concur with the Encratite view that marriage was licentious and a service of the devil. Eusebius of Caesarea stated in his 4th-century history of the church that the Encratites actually rejected both the Pauline Letters and The Acts of the Apostles.

encryption: *see* data encryption.

encyclical, pastoral letter written by the pope for the whole Roman Catholic church on matters of doctrine, morals, or discipline. Although formal papal letters for the entire church were issued from the earliest days of the church, the first commonly called an encyclical was *Ubi primum*, dealing with episcopal duties, published by Benedict XIV in 1740. Only from the time of Pius IX (1846–78) have encyclicals been frequently used. Encyclicals are normally addressed to the bishops of the church, but a few (notably *Pacem in terris* by John XXIII) have been addressed also to "all men of good will." The formal title of an encyclical consists of the first few words of the official text; the language is usually Latin, and the document is not considered to be infallible.

encyclopaedia, also spelled ENCYCLOPEDIA (from Greek *enkyklios paideia*, "general education"), reference work that contains information on all branches of knowledge or that treats a particular branch of knowledge in a comprehensive manner.

A brief treatment of encyclopaedias follows. For full treatment, *see* MACROPAEDIA: Encyclopaedias and Dictionaries.

An encyclopaedia is a self-contained reference work with two main aims: to include up-to-date knowledge about a particular discipline or group of disciplines and to make this knowledge conveniently accessible. An encyclopaedia differs from a dictionary in that it can explain subjects in detail, rather than merely supplying definitions of words and phrases. It differs from an almanac in that the information contained in the latter is dated. It differs from pedagogical texts in its attempt to be easy to consult and to be readily understood by the layperson.

To ensure comprehensiveness and depth of coverage, an encyclopaedia is generally written in the form of many separate articles, often by experts in the field. These articles include background and historical information as well as current material, which consists of varying combinations of text, tables, charts, illustrations, and, in the case of electronic encyclopaedias, audio and video recordings. Some

encyclopaedias also offer study and learning guides, as well as yearly supplements that provide updates of various kinds.

Encyclopaedias vary greatly in format and content. They have ranged from single-volume encyclopaedias (such as the *Columbia Encyclopedia*) to encyclopaedias of more than 100 volumes (China's *Yü-hai* encyclopaedia was printed in 1738 in 240 volumes). A few encyclopaedias (such as *The New Book of Knowledge*) are published specifically for children. Major encyclopaedias may attempt to encompass the entire scope of knowledge as fully as possible for the layperson (e.g., *Brockhaus Enzyklopädie*), while an increasing number of others focus on specific fields of knowledge for the benefit of the specialist (e.g., the *Encyclopedia of Chemical Technology*). In addition, some encyclopaedias, such as the *Encyclopædia Britannica*, are published in both print and electronic versions—the latter appearing as CD-ROM products or as online services.

The many articles contained in an encyclopaedia must be made easily accessible to a reader who desires information on a specific subject. Among print encyclopaedias, it is almost universal practice to order the articles by their titles in a continuous alphabetical sequence, although some encyclopaedias group their articles into subdivisions based on broader subject areas. Finding the desired information is also facilitated by such aids as an alphabetical index and cross-references between articles. In an electronic encyclopaedia, a search-and-retrieval program produces a list of entries that contain information matching a specific request posed by the reader.

The prototype of modern encyclopaedias is usually acknowledged to be Ephraim Chambers' *Cyclopaedia* (1728). This encyclopaedia is thought to have been the first to use an extensive system of cross-references, as well as the first for which supplements were issued. The first modern encyclopaedia was the French *Encyclopédie* (1751–65). This encyclopaedia probably had more influence on its time than did any other work. (*See* *Encyclopédie*.) The first edition of the *Encyclopædia Britannica* (*q.v.*) was published in 1768–71; as it passed through 14 subsequent editions and entered the world of electronic publishing, the *Britannica* evolved into the largest and most comprehensive general encyclopaedia in the English language.

Encyclopædia Britannica, the oldest and largest English-language general encyclopaedia. The *Encyclopædia Britannica* has been published since 1768, when its first edition began to appear in Edinburgh, Scot.

First edition. The *Encyclopædia Britannica*; or, *A Dictionary of Arts and Sciences* was conceived by two printers, Andrew Bell and Colin Macfarquhar, and edited chiefly by the printer and antiquary William Smellie (*qq.v.*). It was printed and published in Edinburgh. Initial pieces of the work began to appear in December 1768, and the whole work was completed in 1771 in three volumes containing 2,391 pages, four folded leaves of unnumbered tables, and 160 copperplates engraved by Bell. The work's merit and novelty consisted, on the one hand, in its consolidating important subjects into lengthy, comprehensive treatises and, on the other, in facilitating reference by the inclusion of many shorter, dictionary-type articles on technical terms and other subjects.

Second edition. The second edition was a much more ambitious work in both length and scope, its 10 volumes totaling 8,595 pages and appearing in parts from 1777 to 1784. There were more treatises than had appeared in the first edition and many new articles, as well as previous articles much expanded. The scope of the second edition was enlarged beyond that of a "dictionary of arts and sciences" by the inclusion of biographical articles and the expansion of geographic articles to

include history. The editor was James Tytler (c. 1747–1804).

Third edition. The third edition was still longer, appearing in parts forming 18 volumes of 14,579 pages (1788–97). It was edited by Macfarquhar until his death in 1793, after which it was completed by George Gleig (1753–1840), a Scottish Episcopalian clergyman. When the edition was completed, Bell bought out the share of ownership of Macfarquhar's heirs. A two-volume supplement, edited by Gleig and printed for Thomas Bonar, Bell's son-in-law, appeared in 1801. The fresh, energetic prose of the third edition and supplement proved to be engaging as well as informative and greatly helped to establish *Britannica's* lasting reputation.

Fourth edition. The fourth edition appeared from 1801 to 1809 and, when completed, was bound in 20 volumes totaling 16,033 pages and dated 1810. Essentially it was a revised reprint of the third edition, adding two volumes to include new and enlarged treatises, extra pages to bring history articles up to date, and more biographical articles. The editor, James Millar (1762–1827), an Edinburgh physician and natural scientist, took pains to repair the omissions and other deficiencies caused in the third edition by the death of Macfarquhar in midcareer.

Fifth and sixth editions and supplement to the fourth, fifth, and sixth editions. The fifth edition (edited successively by Bonar and Millar) was a corrected reprint of the fourth, and the sixth (edited by Charles Maclaren) was a reprint of the fifth with some articles brought up to date. Both were of small importance compared with the supplement to the fourth, fifth, and sixth editions, which was being concurrently prepared and printed. This six-volume supplement appeared in half-volumes from 1815 to 1824, edited by Macvey Napier (1776–1847), who later became editor of the *Edinburgh Review*. The principal innovation of the supplement was that, instead of the editor merely compiling digests of the best available independent publications and using these as the treatises, almost all the articles were original signed contributions. Many of them were written by the most distinguished British scholars of the day, as well as some French scholars. Meanwhile, Archibald Constable, an enterprising Edinburgh publisher, had bought the copyright of *Britannica* from Bell's and Bonar's heirs.

Seventh edition. Constable's firm went bankrupt in 1826, and Constable himself died the following year. The *Encyclopædia Britannica* was then bought by Adam Black, another Edinburgh publisher, for whom Napier edited the seventh edition. Its 21 volumes, totaling 17,101 pages and 506 plates, appeared in parts from 1830 to 1842. The seventh edition was a revision of previous editions, incorporating the supplement and a number of newly commissioned articles. An extra volume provided the useful innovation of a general index, which became a standard feature of further editions.

Eighth edition. The eighth edition, in 21 volumes with an extra index volume, contained a total of 17,957 pages and 402 plates and appeared from 1852 to 1860. Napier had died, and the new editor was T.S. Traill (1781–1862), professor of medical jurisprudence at the University of Edinburgh. Although retaining articles from older editions, the eighth edition was very thoroughly revised.

Ninth edition. The 24 volumes and index volume of the ninth edition—one of the greatest—appeared one by one between 1875 and 1889. Its editor was T.S. Baynes, a professor of logic, metaphysics, and English literature at St. Andrews and a Shakespearean scholar. He planned the edition and continued work on it until his death in 1887, working from 1881

with William Robertson Smith, a Semitic scholar, as joint editor. The ninth edition, known as the "scholars' encyclopaedia," was controversial in its progressive and knowledgeable stance on the scientific and religious debates of its day. The work's list of about 1,100 contributors includes more than 70 American scholars and about 60 scholars from the countries of continental Europe. Ownership of the *Encyclopædia Britannica* passed permanently to the United States when the American publisher Horace E. Hooper, along with another publisher, Walter M. Jackson, purchased the *Britannica* outright from Adam and Charles Black in 1901.

10th edition. The 10th edition (1902–03) was published under the sponsorship of *The Times* of London. It added 11 supplementary volumes to those of the ninth, updating much of the material, especially in history. The editors of the 10th edition were Sir Donald Mackenzie Wallace, Hugh Chisholm, Arthur T. Hadley, and Franklin H. Hooper, the brother of Horace Hooper.

11th edition. The famed 11th edition was issued in 29 volumes by the Cambridge University Press in 1910–11 after editorial disputes and a lawsuit between Jackson and Horace Hooper had prompted *The Times* to cancel its contract in 1909. As with the 10th edition, the 11th saw Franklin Hooper in charge of the New York editorial office and Hugh Chisholm of the London office, where the greater part of the work was done. The 11th edition marked a departure from previous editions in its splitting up of the traditional lengthy, comprehensive treatises into somewhat more particularized articles. As a result the 11th edition had 40,000 articles—more than double the 9th edition's 17,000—although its total amount of text was not much greater. The 11th edition took over and revised many articles from the 9th and 10th editions. In addition there were many new entries, as well as new sections to earlier entries which covered history in greater detail. The rich, leisurely prose of the 11th edition marked the pinnacle of literary style in the *Britannica*.

In 1920 *Britannica* was bought by the Chicago mail-order house of Sears, Roebuck and Company, with Horace Hooper serving as its publisher until his death in 1922.

12th and 13th editions. In 1922 three supplementary volumes prepared under the editorial direction of Chisholm in London and Franklin Hooper in New York City were added to the 29 volumes of the 11th edition, which then became the 12th edition. In 1926 three wholly new supplementary volumes, edited by Hooper in New York City and J.L. Garvin in London, became the 13th edition. During this period (1923–28) ownership shifted from Sears, Roebuck to Hooper's widow and his brother-in-law, William J. Cox.

14th edition. In 1928 Sears, Roebuck bought back the *Britannica*, retaining Cox as publisher to put out a revised edition of the now badly out-of-date 11th edition. It was edited by Garvin in London and Franklin Hooper in New York City, and it took approximately three years (1926–29) to complete this work. Space was found for many new articles on scientific and other subjects by cutting down the ample style and learned detail of the 11th edition, from which a great deal of material was carried over in shortened form. More than 3,500 authors of all nationalities contributed articles. The set of 24 volumes, one of which contained an index and a complete atlas, was published in 1929. In 1932 Cox resigned as publisher, and Elkan Harrison Powell, who was vice president of Sears, Roebuck, was chosen to replace him, becoming president of the company. Powell initiated an important change in editorial method—con-

tinuous revision. Thereafter, instead of appearing in completely reset editions at long intervals, the encyclopaedia was revised and reprinted annually. Also begun in 1938 was the volume called *Britannica Book of the Year*, which covered the significant developments of the year preceding publication.

Late in 1941 William Benton, a former advertising executive and then a vice president of the University of Chicago, obtained from Sears, Roebuck and Company the offer of all rights to the *Encyclopædia Britannica* as a gift to the university. When the trustees of the university decided not to undertake the financial risks, Benton supplied the working capital and became chairman of the board of directors of Encyclopædia Britannica, Inc., and majority stockholder. Robert M. Hutchins, then president of the university, was named chairman of the board of editors. Headquarters were established in Chicago.

15th edition. In 1952, with *Britannica's* publication of his *Great Books of the Western World*, there began the long association of philosopher Mortimer J. Adler with *Britannica*. (On Hutchins' retirement in 1974, Adler succeeded him as chairman of the board of editors.) Under the stewardship of Adler, Benton, and Charles E. Swanson (president of the company from 1967 to 1985), a vast editorial effort was assembled, resulting in the first publication of *Britannica 3*, or the 15th edition, in 1974. The new set consisted of three parts serving different functions: the *Micropædia* (Ready Reference), *Macropædia* (Knowledge in Depth), and *Propædia* (Outline of Knowledge). The 15th edition was given a world point of view by more than 4,000 contributing authors from more than 100 countries. The general editor was Warren E. Preece, and the executive editor was Philip W. Goetz.

Annual revisions of the set continued, supplemented by a major revision of the 15th edition for 1985. For that printing, the *Macropædia* was restructured, with the amalgamation and regrouping of hundreds of articles; the index function was taken from the *Micropædia* and placed in a two-volume *Index*: and both the *Micropædia* and the *Propædia* were redesigned, reorganized, and revised. The entire set consisted of 32 volumes. The company began a massive revision of the encyclopaedia database in 1999.

In the early 1990s, *Britannica* was made available for electronic delivery on a number of CD-ROM-based products, including the *Britannica Electronic Index* and the *Britannica CD* (providing text and a dictionary on a single disc). A two-disc CD was released in 1995, featuring illustrations and photos; multimedia content, including videos, animations, and audio, was added in 1997. A DVD version of the encyclopaedia first appeared in 1999.

Under the direction of editor-in-chief Robert McHenry, the company also developed *Britannica Online*, an electronic reference service for delivery over the Internet. The first Internet-based encyclopaedia, it debuted on the World Wide Web in 1994. Users paid a fee to access the information, which was located at <http://www.eb.com>. Five years later the company launched *Britannica.com*, a site featuring an Internet search engine, subject channels, current events, and essays, as well as the complete text of the encyclopaedia. *Britannica Online* continued to exist, used primarily by educational institutions.

Encyclopædia Americana, The, American general encyclopaedia, published in Danbury, Conn., by Grolier, Inc., the first major multi-volume encyclopaedia published in the U.S.

First published in 1829–33, with subsequent editions in 1911 (20 volumes) and 1918–20 (30 volumes), and thereafter continuously revised, *Americana* is international in scope and is known for its detailed coverage of American and Canadian geography and history. It is also

strong in biography and scientific and technical subjects. All major articles are signed, many by scholars preeminent in their fields.

Because of its continual volume-by-volume revision, some parts of the set are inevitably less current than others. The last complete revision and total resetting occurred in 1918–20, and that edition became the basis for its successors. The alphabetical index (volume 30) is kept up to date with each printing, however, and serves as an instructional as well as an updating device. The *Encyclopædia Americana* is also available online.

Encyclopédie, in full ENCYCLOPÉDIE, OU DICTIONNAIRE RAISONNÉ DES SCIENCES, DES ARTS ET DES MÉTIERS (French: "Encyclopaedia, or Classified Dictionary of Sciences, Arts, and Trades"), the 18th-century French encyclopaedia that was one of the chief works of the Philosophes. The *Encyclopédie* was a literary and philosophical enterprise with profound political, social, and intellectual repercussions in France just prior to the Revolution. Its contributors were called Encyclopédistes.

The *Encyclopédie* was inspired by the success of Ephraim Chambers' *Cyclopaedia; or An Universal Dictionary of Arts and Sciences* (London, 1728). Indeed, the work originated in an abortive attempt to put out a five-volume French translation of Chambers' *Cyclopaedia*. When this project collapsed in 1745, its intended publisher, André Le Breton, immediately embarked on plans for an expanded *Encyclopédie*. He secured the services of the mathematician Jean d'Alembert in 1745 and of the translator and philosopher Denis Diderot in 1746 to assist in the project. In 1747 Diderot undertook the general direction of work on the *Encyclopédie*, except for its mathematical parts, which were edited by d'Alembert. (D'Alembert resigned in 1758.) Seventeen volumes of the *Encyclopédie's* text were published between 1751 and 1765; 11 volumes of plates were also published between 1762 and 1772, for a total of 28 volumes. These were supplemented in 1776–77 by five volumes—four of text and one of illustration plates—and by two volumes of index in 1780, all compiled under other editors, since Diderot had refused to edit the supplements. These seven volumes, plus the 28 prepared by Diderot, constituted the first edition of the *Encyclopédie* in 35 folio volumes.

The *Encyclopédie* was a showcase for representatives of the new schools of thought in all branches of intellectual activity. The work was notable for its attitude of tolerance and liberalism and also for its innovative coverage of the trades and mechanical arts. In its skepticism, its emphasis on scientific determinism, and its criticism of the abuses perpetrated by contemporary legal, judicial, and clerical institutions, the *Encyclopédie* functioned as an expression of progressive thought and served as an intellectual prologue to the French Revolution.

The *Encyclopédie's* publication was opposed by conservative ecclesiastics and government officials almost from the start. The work was subjected to Jesuit censorship and the suppression of several volumes by the French Council of State (1752), and it was formally condemned and denied permission for publication in 1759 and for several years thereafter. At this point Diderot's friends urged him to abandon the project, but he persuaded the publishers to secure permission to bring out the relatively uncontroversial volumes of illustration plates, while the remaining volumes of text were edited and printed. Diderot also discovered in 1764 that Le Breton and a compositor had secretly removed about 300 pages of liberal or controversial material from the proof sheets of about 10 folio volumes.

The group of writers that Diderot and d'Alembert assembled for the production of the *Encyclopédie* were at first relatively unknown, with the exception of Jean-Jacques

Rousseau and Baron d'Holbach. But as both the fame of the *Encyclopédie* and the attacks upon it grew, distinguished and expert contributors were attracted, including A.-R.-J. Turgot, Voltaire, J.-F. Marmontel, and Jacques Necker. Diderot himself contributed innumerable articles, especially on philosophy, social theory, and the trades, proving to be both an energetic general editor and the driving force behind the crisis-ridden project. It was he who compiled and supervised the preparation of the work's 3,000 to 4,000 plates, many of which vividly illustrated industrial arts and processes.

In 1782 the publication of a new, enlarged edition departing from the alphabetical arrangement of the first edition was begun under the title *Encyclopédie méthodique ou par ordre de matières* ("Systematic Encyclopaedia or Arranged by Subject"). Work on this topically arranged encyclopaedia continued through the French Revolution and was completed in 1832 with the appearance of the 166th volume, 50 years after the appearance of the first volume.

end-plate potential (EPP), chemically induced change in electric potential of the motor end-plate, which is that portion of the muscle-cell membrane that lies opposite the terminal of a nerve fibre at the neuromuscular junction. The end-plate membrane is electrically polarized, the inside being negative with respect to the outside because of an uneven distribution of ions. When a nerve impulse releases the neurotransmitter acetylcholine from the nerve terminal, it binds to channel-shaped receptor molecules on the end-plate, opening the channels and allowing positively charged sodium ions to flow into the muscle cell. This redistribution of ions slightly depolarizes the membrane. An enzyme then rapidly degrades the acetylcholine, closing the channels and allowing the membrane to return to its previous polarized state.

Acetylcholine is released in bursts, or quanta. A single quantum causes only a slight depolarization, called a miniature end-plate potential (MEPP). One hundred to 200 quanta, released simultaneously or in rapid series by a nerve impulse, cause multiple MEPPs, which summate, or combine, to produce the EPP. If the EPP depolarizes the cell to a crucial threshold level, it will fully activate sodium channels all along the membrane and produce the action potential. The action potential will then stimulate the muscle cell to contract. *See also* action potential.

endangered species, any species of plant or animal that is threatened with extinction.

A number of agencies, both international and national, work to maintain lists of endangered species, to protect and preserve natural habitats, and to promote programs for recovery and reestablishment of these species. One such international agency is the Survival Service Commission of the International Union for Conservation of Nature and Natural Resources (IUCN), which publishes information on endangered species worldwide in a series of loose-leaf binders called the *Red Data Book*. Another agency is the Secretariat for the Convention on International Trade in Endangered Species of Wild Fauna and Flora.

In the United States the U.S. Fish and Wildlife Service of the Department of the Interior is responsible for conservation and management of fish and wildlife resources and their habitats, including endangered species. The service was created in 1940 from the consolidation of the Bureau of Fisheries (1871) and the Bureau of Biological Survey (1885). The Endangered Species Act of 1973 (superceding those of 1966 and 1969) obligates the government to protect all animal and plant life threatened with extinction, including in this category "threatened" species, defined as any species "which is likely to become endangered in the foreseeable future throughout all

or a significant portion of its range." It also provides for the drawing up of lists of such species and promotes the protection of critical habitats (areas designated as critical to the survival of a species).

By 1990 the U.S. Fish and Wildlife Service had compiled a list of almost 1,000 species of endangered or threatened animals and plants (of which more than 500 are found only in foreign countries), and some 200 recovery programs were in effect.

Endecott, John, Endecott also spelled ENDICOTT (b. c. 1588, probably Devon, Eng.—d. March 15, 1665, Boston), colonial governor of the Massachusetts Bay Colony, under whose leadership the new colony made rapid progress.

Endecott, detail of a portrait by an unknown artist, 17th century; in the State House, Boston

By courtesy of the State Library of Massachusetts Boston

Little is known of Endecott before 1628, when, as one of the six grantees of the New England Company for a Plantation in Massachusetts, he was chosen manager and governor of their settlement. In that year Endecott, with about 60 fellow settlers, went to Naumkeag, a location already occupied by a group of seceders from Plymouth who were led by Roger Conant. According to tradition, the establishment of good relations between the two groups prompted the change of the name of the settlement to Salem (from the Hebrew word *shalom*, "peace"). When the jurisdiction of the New England Company was supplanted by that of the Massachusetts Bay Company (1629), Endecott briefly served as the local governor (April 1629–June 1630) of the Massachusetts Bay Colony. He was succeeded in 1630 by John Winthrop, with whom he worked in harmony despite strong religious differences. Endecott almost continuously occupied prominent official positions in the Massachusetts Bay Colony. He again served as governor in 1644–45, 1649–50, 1651–54, and 1655–64 and was deputy governor in 1641–44, 1650–51, and 1654–55.

Ender, Otto (b. Dec. 24, 1875, Altach, Austria—d. June 25, 1960, Bregenz), statesman and government official who served as chancellor of Austria during the early months of the Great Depression.

Ender served (1918–34) as governor of the Austrian state of Vorarlberg, on the Swiss border, and after World War I he negotiated unsuccessfully for the incorporation of Vorarlberg in the Swiss confederation. Despite his leadership of the Vorarlberg Heimwehr (rightist paramilitary defense force), his allegiances were considered to be democratic and anti-Fascist. Ender was appointed chancellor of Austria in December 1930 and held office through six months of economic depression, marked notably by the collapse of the Creditanstalt, the most important Austrian banking house. Later, as minister without portfolio in the government of Engelbert Dollfuss, he supervised the drafting of a new federal authoritarian constitution (1933–34). He headed (1934–38) the Austrian supreme board of ac-

countancy. Imprisoned by the Nazis after the *Anschluss* (Austria's incorporation into Germany in 1938), he was later interned at Dachau, Ger., and finally released during the Allied liberation (1945).

Enderby Land, region of Antarctica, bordering on the Indian Ocean and extending from Prince Olav Coast of Queen Maud Land (west) to Edward VIII Bay and Kemp Coast (east). Primarily a barren, ice-capped plateau in the interior sections, it rises to rugged peaks along the coast, where the Napier Mountains exceed 7,400 feet (2,260 m). The English navigator John Biscoe, sailing for Enderby Brothers, a London whaling firm, discovered the coast in 1831 and named it for his employers. Enderby Land, claimed by Australia, is the site of a research station opened by the Soviet Union in 1963.

Enders, John Franklin (b. Feb. 10, 1897, West Hartford, Conn., U.S.—d. Sept. 8, 1985, Waterford, Conn.), American virologist and microbiologist who, with Frederick C. Robbins and Thomas H. Weller, was awarded the Nobel Prize for Physiology or Medicine for 1954 for his part in cultivating the poliomyelitis virus in nonnervous-tissue cultures, a preliminary step to the development of the polio vaccine.

Enders was a student of English literature at Harvard University (M.A., 1922) before he turned to bacterial studies there (Ph.D., 1930). His early researches contributed new and basic knowledge to problems of tuberculosis, pneumococcal infections, and resistance to bacterial diseases. In 1929 he joined the Harvard faculty as an assistant in the department of bacteriology and immunology, later advancing to assistant professor (1935) and associate professor (1942) in the university's medical school.

In World War II he was a civilian consultant on infectious diseases to the U.S. War Department. From 1945 to 1949 he served the U.S. Army in a like capacity, with particular work on the mumps virus and rickettsial diseases. During this period Enders, with his coworkers Weller and Robbins, began research into new methods of producing in quantity the virus of poliomyelitis. Until that time the only effective method of growing the virus had been in the nerve tissue of living monkeys, and the vaccine thus produced had been proved dangerous to humans. The Enders-Weller-Robbins method of production, achieved in test tubes using cultures of nonnerve tissue from human embryos and monkeys, led to the development of the Salk vaccine for polio in 1954. Similarly, their production in the late 1950s of a vaccine against the measles led to the development of a licensed vaccine in the United States in 1963. Much of Enders' research on viruses was conducted at the Children's Hospital in Boston, where he had established a laboratory in 1946.

Endicott, John: *see* Endecott, John.

endive (*Cichorium endivia*), edible annual leafy plant of the family Asteraceae, variously believed to have originated in Egypt and Indonesia and cultivated in Europe since the 16th century. Its many varieties form two groups, the curly-leaved, or narrow-leaved, endive (*crispa*), and the Batavian, or broad-leaved, endive (*latifolia*). The former is mostly used for salads, the latter for cooking.

The plant requires a rich, light, well-drained, unshaded soil. When sown late in the season, it behaves as a biennial. About three months after sowing, the plant's outer leaves are tied together or are covered, to exclude light. This prevents the development of the natural bitter taste. This bleaching process takes 10 days to 4 weeks.

Endlicher, Stephan, in full STEPHAN LADISLAUS ENDLICHER (b. June 24, 1804, Pressburg, Hung. [now Bratislava, Slovakia]—d. March 28, 1849, Vienna, Austria), Austrian botanist who formulated a major system of plant classification.

Endlicher turned from the study of theology to that of natural history and medicine while at the Universities of Budapest and Vienna (M.D., 1840). In 1836 he became curator of the Vienna Museum of Natural History, to which he would eventually donate his herbarium of 30,000 specimens. While reorganizing the museum's botanical collections, he wrote the *Genera Plantarum Secundum Ordines Naturales Disposita* (1836–40; "Plant Genera Arranged According to a Natural Order"), a system of classification in which he treated 6,835 genera of plants (6,285 of vascular plants). He was appointed professor of botany at the University of Vienna in 1840. Having exhausted his modest resources buying botanical collections and books and publishing his own and others' writings, Endlicher committed suicide.

Endlicher, lithograph by J. Höfelich after a portrait by Josef Kriehuber

By courtesy of the Bild-Archiv, Österreichische Nationalbibliothek, Vienna

Although Endlicher's system was based on erroneous ideas concerning the modes of growth of different types of plant life, it included a relatively modern approach to the classification of certain lower vascular plant families and was widely adopted on the European continent for a time. His *Genera Plantarum*, in which he divided the plant kingdom into thallophytes (including the algae, fungi, and lichens) and cormophytes (including the mosses, ferns, and seed plants), remained a valuable descriptive index to plant families and genera for more than a half century.

Endō Shūsaku (b. March 27, 1923, Tokyo, Japan—d. Sept. 29, 1996, Tokyo), Japanese novelist noted for his examination of the relationship between East and West through a unique Christian perspective.

Endō became a Roman Catholic at age 11 with the encouragement of his mother and an aunt. At Keio University he majored in French literature (B.A., 1949), a subject he studied from 1950 to 1953 at the University of Lyon in France. His first collections of fiction, *Shiroi hito* and *Kiroyi hito* (both 1955; "White Man" and "Yellow Man"), indicate the direction of most of his later fiction: they contrast Japanese and Western experience and perspectives. In *Umi to dokuyaku* (1957; *The Sea and Poison*), he examines the Japanese sense of morality via a war story about Japanese doctors performing a vivisection on a downed American pilot. One of Endō's most powerful novels, *Chimmoku* (1966; *Silence*), is a fictionalized account of Portuguese priests who traveled to Japan and the subsequent slaughter of their Japanese converts. This novel and *Samurai* (1980; *The Samurai*)—a fascinating account of a samurai's journey on behalf of

his shogun to open trade with Mexico, Spain, and Rome—are considered his best writing, showing the complexities of the interactions between cultures as well as presenting a supple and well-told narrative.

Endō's other extended fiction includes *Kazan* (1959; *Volcano*), *Kuchibue o fuku toki* (1974; *When I Whistle*), *Sukyandaru* (1986; *Scandal*), and a number of comic novels. He also wrote short stories, drama, essays, and a biography.

endocarditis, inflammation of the heart lining, or endocardium. The inflammation may be associated with a noninfectious disease or may be caused by infection with any of a number of organisms, including bacteria and fungi. The site of the infection is usually the lining of the heart valves. Traditionally, infective endocarditis was classified as acute or subacute; more recently it has been classified by causative organism. The variety traditionally identified as acute usually results from severe infection with a well-known disease organism, such as *Staphylococcus aureus* (which is responsible for boils and abscesses) or *Neisseria gonorrhoeae* (the organism that causes gonorrhoea). This form of infectious endocarditis develops rapidly, with fever, sweating, chills, pain in and swelling of the joints, weakness, loss of appetite and weight, visual disturbances, recurrent nosebleeding, frequent bruising, symptoms of heart failure, and a general feeling of ill health. Clumps of bacteria may break loose from the valve and enter the circulation, blocking the blood flow at some point. Petechiae, minute specks of colour from the bleeding of small blood vessels, may appear in the skin, in the mucous membrane lining the mouth or the throat, or in the conjunctivas. Subacute—or chronic—endocarditis is usually caused by bacteria that do not cause disease except in tissues that are already weakened; thus, the chronic form may attack hearts weakened by congenital defects or previous infection. Bacterial endocarditis is usually treated by long-continued administration of bactericidal antibiotics, particularly some form of penicillin.

Nonbacterial thrombotic endocarditis is an inflammation of unknown cause marked by the growth of blood clots along the closure lines of the heart valves. Symptoms include nosebleeds, bleeding of the gums, pain in the joints, fever, and a heart murmur during systole (heart contraction). Endocarditis also may be a feature of systemic lupus erythematosus, a disease of unknown cause that affects the connective tissues and may invade any organ of the body.

endocrine system, group of ductless glands that regulate body processes by their secretion of chemical substances called hormones, which are carried to specific target organs and tissues by the bloodstream.

A brief treatment of endocrine systems follows. For full treatment, see MACROPAEDIA: Endocrine Systems.

For a depiction of some of the structures that make up the human endocrine system, shown in relation to other parts of the gross anatomy, see the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

Hormones are necessary for normal growth and development, for reproduction, and for homeostasis (a constant internal environment). They stimulate or inhibit various biochemical processes by combining with specific receptors on the membranes of target organs. Thus, although a hormone circulates in the bloodstream, it does not affect every cell with which it comes in contact but only those cells that contain a specific receptor site.

The major endocrine glands in humans are the hypothalamus, the pituitary, the thyroid, the islets of Langerhans in the pancreas, the adrenals, the parathyroids, the ovaries, and the testes. Almost every other organ or tissue

of the body—including the intestinal tract, the stomach, and the heart—has been found to be involved in endocrine secretions. In the muscle cells of vertebrate hearts, for example, there are bodies that release a hormone that affects the regulation of blood pressure, blood volume, and the salt-and-water balance. Tumours may be sites of hormonal secretions.

Hormonal secretions are generally regulated by negative-feedback loops. In the simple loops, the concentration of another hormone or a metabolite (such as calcium) influences sensitive regulators in an endocrine gland to inhibit or stimulate hormonal secretions in the target organ. The complex loops involve a mechanism called the hypothalamo-pituitary-target organ axis, in which the hypothalamus secretes releasing hormones that stimulate the pituitary to secrete a target hormone, which then enters the circulation and binds with the receptors of the target organ.

Because the hypothalamus is an integral part of the brain and central nervous system, and because it is involved in negative-feedback loops in the endocrine system, the hypothalamus forges a critical link between the body's two control systems—the nervous system and the endocrine system. In addition, stimulation by the autonomic (involuntary) nervous system partly regulates the adrenal medulla and pancreas, and the two systems are again linked. The interrelationship of the two systems provides an opportunity for the body to respond to changes in the internal and external environments.

Diseases of the endocrine system result from too much or too little hormone secretion or from the inability of the body to utilize a hormone effectively. Growth hormone, for example, is an anterior pituitary secretion that is necessary for normal growth in children. An excess of this hormone during childhood can lead to gigantism; a deficiency, on the other hand, can result in dwarfism.

One of the most common—and serious—endocrine diseases is diabetes mellitus. In its severest form, which usually begins during childhood or adolescence, diabetes results from insufficient production of the pancreatic hormone insulin. A milder form of the disease, which usually strikes middle-aged adults who are overweight and sedentary, results from an inability to utilize insulin effectively. See also hormone.

Consult the INDEX first

endocrinology, medical discipline dealing with the role of hormones and other biochemical mediators in regulating bodily functions and with the treatment of imbalances of these hormones. Although some endocrine diseases, such as diabetes mellitus, have been known since antiquity, endocrinology itself is a fairly recent medical field, depending as it does on the recognition that body tissues and organs secrete chemical mediators directly into the bloodstream to produce distant effects.

Friedrich Henle in 1841 was the first to recognize "ductless glands," glands that secrete their products into the bloodstream and not into specialized ducts. In 1855 Claude Bernard distinguished the products of these ductless glands from other glandular products by the term "internal secretions," the first suggestion of what was to become the modern hormone concept.

The first endocrine therapy was attempted in 1889 by Charles Brown-Séquard, who used extracts from animal testes to treat male aging; this prompted a vogue in "organotherapies" that soon faded but that led to adrenal and thyroid extracts that were the forerunners of modern cortisone and thyroid hormones. The first hormone to be purified was secretin, which is produced by the small intestine to trigger the release of pancreatic juices;

it was discovered in 1902 by Ernest Starling and William Bayliss. Starling applied the term "hormone" to such chemicals in 1905, proposing a chemical regulation of physiological processes operating in conjunction with nervous regulation; this essentially was the beginning of the field of endocrinology.

The early years of this century saw the purification of a number of other hormones, often leading to new therapies for patients affected by hormonal disorders. In 1914 Edward Kendall isolated thyroxine from thyroid extracts; in 1921 Frederick Banting and Charles Best discovered insulin in pancreatic extracts, immediately transforming the treatment of diabetes; and in 1929 Edward Doisy isolated an estrus-producing hormone in the urine of pregnant females.

The availability of nuclear technology after World War II also led to new treatments for endocrine disorders, notably the use of radioactive iodine to treat hyperthyroidism, greatly reducing the need for thyroid surgery. Combining radioactive isotopes with antibodies against hormones. Rosalyn Yalow and S.A. Berson in 1960 discovered the basis for radioimmunoassays, which enable endocrinologists to determine with great sensitivity minute amounts of hormone, permitting the early diagnosis and treatment of endocrine disorders. These assays have become increasingly important in the late 20th century.

endoderm, the innermost of the three germ layers, or masses of cells (lying within ectoderm and mesoderm), which appears early in the development of an animal embryo. The endoderm subsequently gives rise to the epithelium (tissue that covers, or lines, a structure) of the pharynx, including the eustachian tube, the tonsils, the thyroid gland, parathyroid glands, and thymus gland; the larynx, trachea, and lungs; the gastrointestinal tract (except mouth and anus), the urinary bladder, the vagina (in females), and the urethra. The term endoderm is sometimes used to refer to the gastrodermis, the simple tissue that lines the digestive cavity of cnidarians and ctenophores. *Compare* ectoderm; mesoderm.

endodontics, in dentistry, diagnosis, treatment, and prevention of diseases of the dental pulp and the surrounding tissues. (The dental pulp is soft tissue in the centre of the tooth; it contains the nerve, blood and lymphatic vessels, and connective tissue.)

The practice of endodontics is concerned primarily with the removal of diseased dental pulp and its replacement with filling material, an operation known as root canal therapy. After the pulp is removed, the tooth continues to be nourished by connecting blood vessels in the jaw. The tooth is then considered to be dead, although the fibres that hold the teeth in the jawbone are alive.

Operations on the pulp are performed with the aid of local anesthesia. Preservation of the natural tooth in this manner serves both appearance and utility; a natural tooth implanted in the jaw maintains the integrity of the dental arch and can withstand about 10 times more pressure than can artificial teeth.

endogamy (kinship): *see* exogamy and endogamy.

endometriosis, disorder of the female reproductive system characterized by the growth of endometrial tissue (uterine lining) in an abnormal location. The condition is more common in those who are childless.

Rather than flowing out of the uterus by way of the vagina (during menstruation), some fragments of the endometrium may leave via the fallopian tubes and move into the pelvic cavity and there become embedded on other pelvic structures. The most common location of the implants of endometrial tissue are the ovaries; other areas and organs that are affected (in order of incidence) are uterosacral

ligaments (thickened portions of the sheet of connective tissue covering the pelvic organs), the rectovaginal septum (the membrane dividing the rectum from the vagina), the sigmoid colon (that portion of the large intestine that leads into the rectum), the lower genital tract, the round ligaments of the uterus, and the peritoneum (membrane) lining the pelvis. Symptoms associated with this disease include (1) progressive, severe pain associated with menstruation or occurring just before it, (2) dyspareunia (painful intercourse), (3) painful defecation, (4) slight bleeding before menstruation and excessive flow during menstruation, (5) painful urination and blood in the urine, and (6) infertility. The condition is best diagnosed by laparoscopy, a surgical procedure that allows a physician to examine visually the pelvic organs for endometrial adhesions. Treatment of endometriosis includes surgery and the suppression of ovulation for six to nine months by administration of hormones.

In the late 1980s researchers suggested that endometriosis was linked to relatively thin bones—by means of the circulation of an immune-system hormone that suppresses bone growth—and put women with endometriosis at higher risk for osteoporosis.

endomorph, a human physical type (somatotype) tending toward roundness, as determined by the physique classification system developed by American psychologist W.H. Sheldon. The extreme endomorph has a body as nearly globular as humanly possible; he has a round head, a large, round abdomen, large internal organs relative to his size, rather short arms and legs with fat upper arms and thighs, but slender wrists and ankles. Under normal conditions the endomorph individual has a great deal of body fat, but he is not simply a fat person; if starved, he remains an endomorph, only thinner. *Compare* ectomorph; mesomorph.

endoparasitic slime mold: *see* Plasmodiophoromycetes.

endoplasmic reticulum (ER), in biology, a highly convoluted membrane within the cytoplasm of a eukaryotic cell that is important in the biosynthesis of proteins and lipids. The ER usually constitutes more than half of the membrane of the cell and is continuous with the outer membrane of the nuclear envelope. Endoplasmic reticulum has two distinct regions: the rough ER (RER; so-called because of the ribosomes attached to its outer cytoplasmic surface), which synthesizes secretory proteins, phospholipids, and membrane, and the smooth ER (SER), which is not associated with ribosomes and principally transfers products of the RER by budding off transport vesicles. The SER is also involved in the synthesis of lipids and the detoxification of some toxic chemicals. The sarcoplasmic reticulum is a specialized ER that regulates the calcium ion concentration in the cytoplasm of striated muscle cells. *See also* cell.

Endor, Witch of, in the Old Testament (1 Samuel 28:3–25), a female sorcerer who was visited by Saul, the first king of Israel. Although Saul had banished all sorcerers and conjurers from his kingdom, his concern about the final outcome of Israel's battle against the Philistines caused him to seek the services of someone with "a familiar spirit." When his servants told him of such a woman at Endor, he disguised himself and visited her that night. He asked her to conjure up the spirit of the prophet Samuel to tell his fortunes. When the woman reminded him of the law against practicing her art, he assured her that she would be protected. The woman accordingly conjured up a spirit identified by Saul as Samuel. The spirit informed Saul that he and his three sons would die in battle the next day and that the Israelites would fall to the Philistines.

The story of the Witch of Endor has excited

the creative imagination through the ages and inspired further embellishment of her practices. Chaucer, for example, in the Friar's Tale of *Canterbury Tales*, speaks of her as a "pithonesse," and the 16th-century writer Guillaume du Bartas suggests in *La Semaine* that she used a "flambeau" made from the fat of her own son in the necromantic art.

endorphin, any of a group of opiate proteins with pain-relieving properties that are found naturally in the brain. The main substances identified as endorphins include the enkephalins, beta-endorphin and dynorphin, all discovered in the 1970s. Endorphins are distributed in characteristic patterns throughout the nervous system, with beta-endorphin found almost entirely in the pituitary gland.

Endorphins have been found to be clearly involved in the regulation of pain; even the analgesic effects of acupuncture treatments may be attributable to them. Such substances are also believed to have some relation to appetite control, the release of sex hormones through the pituitary, and the adverse effects of shock. There is strong evidence that endorphins are connected with "pleasure centres" in the brain. Knowledge about the behaviour of the endorphins and their receptors in the brain has implications for the treatment of opiate addictions and chronic pain disorders.

endoscopy, medical examination of the interior of the body, usually through a natural body opening, by the insertion of a lighted optical shaft or open tube. It is customarily performed with local anesthesia. Instruments used include the esophagoscope, a rigid pipe for examination of the esophagus; the bronchoscope, a similar pipe for examination of the bronchial tubes; and the gastroscope, a flexible lighted shaft for examination of the stomach. These are passed through the mouth into the respective organs. The examinations are usually performed in a hospital, but the patient ordinarily is dismissed immediately thereafter. The open-tube proctosigmoidoscope is passed through the anal orifice without anesthesia for examination of the rectum and lower colon and is a common office procedure. The cystoscope, a lighted rod, is passed through the urethra with local or general anesthesia for examination of the bladder.

Three endoscopic procedures require incisions for the introduction of the lighted shaft where natural openings do not exist. The thoracoscope permits examination (for suspected adhesions in patients with tuberculosis) of the chest cavity and surface of the lungs through a small incision between the ribs. The peritoneoscope allows examination of the abdominal cavity and lower surface of the liver and gallbladder through a small incision in the abdominal wall. The culdoscope permits examination of the female pelvic organs through a small vaginal incision.

The fibre-optic endoscope is a pliable, highly maneuverable instrument that allows access to channels in the digestive tract that were previously inaccessible to the older, semirigid instruments. Composed of multiple hairlike glass rods bundled together, this instrument can be more easily bent and twisted, and the intense light enables the endoscopist to see around corners as well as forward and backward. Accessories can be added that make it possible to obtain cell and tissue samples, excise polyps and small tumours, and remove foreign objects.

endosperm, tissue that surrounds and nourishes the embryo in the angiosperm seed. The initiation of endosperm is a definitive characteristic of angiosperms and requires the fusion of at least one nucleus in the embryo sac with a sperm nucleus from the pollen grain.

(In gymnosperms the nutritive material of the seed is present before fertilization.) In some seeds the endosperm has been completely absorbed at maturity (*e.g.*, pea and bean); in others, some is present until germination (*e.g.*, wheat, castor bean). In the coconut, the liquid endosperm (coconut "milk") contains important growth substances. Endosperm accounts for the economic importance of cereal grains and oilseeds.

endotoxin, toxic substance bound to the bacterial cell wall and released when the bacterium ruptures or disintegrates. Endotoxins consist of lipopolysaccharide and lipoprotein complexes. The protein component determines its foreign (antigenic) nature; the polysaccharide component determines the antibody type that can react with the endotoxin molecule to produce an immune reaction. Endotoxins are rarely fatal, although they often cause fever.

Endre (Hungarian): *see* Andrew.

endrin, chlorine-containing organic compound used as an insecticide. *See* aldrin.

Endymion, in Greek mythology, a beautiful youth who spent much of his life in perpetual sleep. Endymion's parentage varies among the different ancient references and stories, but several traditions say that he was originally the king of Elis. According to one tradition, Zeus offered him anything that he might desire, and Endymion chose an everlasting sleep in which he might remain youthful forever. According to another version of the myth, Endymion's eternal sleep was a punishment inflicted by Zeus because he had ventured to fall in love with Zeus's wife, Hera. In any case, Endymion was loved by Selene, the goddess of the moon, who visited him every night while he lay asleep in a cave on Mount Latmus in Caria; she bore him 50 daughters. A common form of the myth represents Endymion as having been put to sleep by Selene herself so that she might enjoy his beauty undisturbed.

Energia, also called RKK ENERGIA, formerly OKB-1, Russian aerospace company that is a major producer of spacecraft, launch vehicles, rocket stages, and missiles. Headquarters are in the Moscow suburb of Korolev.

Energia serves as a main contractor for the International Space Station (ISS); it provided the Zvezda module (launched 2000), the control centre and living quarters for the ISS during its initial human occupancy. Other products include the Block DM upper stage and the Yamal communications satellite system.

Energia originated in 1946 as a department of NII-88 (Scientific-Research Institute 88), which was founded to direct Soviet work on long-range missiles after World War II. Under the leadership of the rocket designer Sergey P. Korolyov (*q.v.*), the department separated from NII-88 in 1956 and became the independent design bureau OKB-1. In the 1950s it developed the R-7 (SS-6), the world's first intercontinental ballistic missile. On Oct. 4, 1957, a modified R-7 placed the first artificial satellite, Sputnik 1, into Earth orbit. Over the next decade OKB-1 was responsible for establishing the U.S.S.R.'s commanding early lead in the space race with the United States, although it failed in its secret project in the 1960s to beat the United States to a manned Moon landing.

In 1974 the Soviet government created the conglomerate NPO Energia (Scientific and Production Association Energia), with the former OKB-1 at its centre. A main focus for the company beginning in the 1970s was the development, launch, and manning of Earth-orbiting space stations, including the Salyut

series (launched 1971–82) and the modular station Mir (components launched 1986–96). In the early 1990s Energia became the main contractor for the Russian portion of the ISS. Its role, however, was gradually reduced, owing partly to stiff competition from the Russian company Khruichev. In April 1994 NPO Energia was renamed RKK Energia (Rocket-Space Corporation Energia) and partially privatized. After the dissolution of the Soviet Union in 1991, Energia vigorously pursued partnerships with multinational satellite launching services, to which it provided its Block DM upper stage for boosting payloads to geostationary orbit.

energy, in physics, the capacity for doing work. It may exist in potential, kinetic, thermal, electrical, chemical, nuclear, or other various forms. There are, moreover, heat and work—*i.e.*, energy in the process of transfer from one body to another. After it has been transferred, energy is always designated according to its nature. Hence, heat transferred may become thermal energy, while work done may manifest itself as mechanical energy.

All forms of energy are associated with motion. For example, any given body has kinetic energy if it is in motion. A tensioned device such as a bow or spring, though at rest, has the potential for creating motion; it contains potential energy because of its configuration. Similarly, nuclear energy is potential energy because it results from the configuration of subatomic particles in the nucleus of an atom.

Energy can be converted from one form to another in various ways. Usable mechanical or electrical energy is, for instance, produced by many kinds of devices, including fuel-burning heat engines, generators, batteries, fuel cells, and magnetohydrodynamic systems.

Energy is treated in a number of articles in the MACROPAEDIA. For the development of the concept of energy and the principle of energy conservation, *see* Physical Science, Principles of; Mechanics; Thermodynamics, Principles of. For the major sources of energy and the mechanisms by which the transition of energy from one form to another occurs, *see* Atoms; Fuels, Fossil; Electricity and Magnetism; Energy Conversion.

For a description of the place of energy in the circle of learning and for a list of both MACROPAEDIA and MICROPAEDIA articles on the subject, *see* PROPAEDIA: Part One, Division II; Part Seven, Division II.

energy, conservation of, principle of physics according to which the energy of interacting bodies or particles in a closed system remains constant. The first kind of energy to be recognized was kinetic energy, or energy of motion. In certain particle collisions, called elastic, the sum of the kinetic energy of the particles before collision is equal to the sum of the kinetic energy of the particles after collision. The notion of energy was progressively widened to include other forms. The kinetic energy lost by a body slowing down as it travels upward against the force of gravity was regarded as being converted into potential energy, or stored energy, which in turn is converted back into kinetic energy as the body speeds up during its return to Earth. So the sum of the kinetic and the potential energy of, say, a satellite or a freely swinging pendulum is constant or nearly so. Friction, however, slows down the most carefully constructed mechanisms, thereby dissipating their energy gradually. During the 1840s it was conclusively shown that the notion of energy could be extended to include the heat that friction generates. The truly conserved quantity is the sum of kinetic, potential, and thermal energy. This version of the conservation-of-energy principle, expressed in its most general form, is the first law of thermodynamics. The conception of energy continued to expand to include energy of an electric current, energy stored in an

electric or a magnetic field, and energy in fuels and other chemicals.

With the advent of relativity physics (1905), mass was first recognized as equivalent to energy. The total energy of a system of high-speed particles includes not only their rest mass but also the very significant increase in their mass as a consequence of their high speed. After the discovery of relativity, the energy-conservation principle has alternatively been named the conservation of mass-energy or the conservation of total energy.

When the principle seemed to fail, as it did when applied to the type of radioactivity called beta decay (spontaneous electron ejection from atomic nuclei), physicists accepted the existence of a new subatomic particle, the neutrino, that was supposed to carry off the missing energy rather than reject the conservation principle. Later, the neutrino was experimentally detected.

Energy conservation, however, is more than a general rule that persists in its validity; it can be shown to follow mathematically from the uniformity of time. If one moment of time were peculiarly different from any other moment, identical physical phenomena occurring at different moments would require different amounts of energy, so that energy would not be conserved.

energy state, also called ENERGY LEVEL, in physics, any discrete value from a set of values of total energy for a subatomic particle confined by a force to a limited space or for a system of such particles, such as an atom or a nucleus. A particular hydrogen atom, for example, may exist in any of several configurations, each having a different energy. These energy states, in their essentials, remain fixed and are referred to as stationary states.

The state of a hydrogen atom, or any microscopic system, however, may change from one configuration to another by emitting or absorbing a discrete amount of energy. Such configurations are also called energy levels; the atom, or system, is said to undergo a transition between two energy levels when it emits or absorbs energy. The lowest energy level of a system is called its ground state; higher energy levels are called excited states. *See also* Franck-Hertz experiment.

Enewetak, also spelled ENIWETOK, atoll, northwestern end of the Ralik chain, Republic of the Marshall Islands, in the western Pacific Ocean. Circular in shape (50 miles [80 km] in circumference), it comprises 40 islets around a lagoon 23 miles (37 km) in diameter. During World War II it was captured from the Japanese by U.S. forces (February 1944), and its fine anchorage was made into a naval base. Its inhabitants were evacuated to other atolls after it was designated, with Bikini atoll, a testing ground for atomic weapons. Tests were held in 1948, 1951, 1952, 1954, and 1956. In 1980, after the island's contaminated topsoil was removed, Enewetak was declared decontaminated, and its people were given an opportunity to return. Their first crops grown were found to be too badly contaminated, and, as at Bikini atoll, the people had to be removed again. Pop. (latest est.) 1,100.

Enfantin, Barthélemy-Prospér (b. Feb. 8, 1796, Paris, Fr.—d. Sept. 1, 1864, Paris), eccentric French social, political, and economic theorist who was a leading member of the St. Simonian movement.

After studies at the École Polytechnique, Enfantin traveled widely and frequented secret societies in Paris. When introduced to the social reformer Claude-Henri de Rouvroy St. Simon (1825), he became one of his most ardent followers and helped organize *Le Globe*, a major forum for St. Simonian ideas.

After the death of St. Simon (May 1825), Enfantin and St. Amand Bazard emerged as the two *pères suprêmes* ("supreme fathers") of

Enfantin, detail of a portrait by an unknown artist, 19th century

By courtesy of the Bibliothèque Nationale, Paris

what began to take the characteristics of a religious movement. They broke in 1831, for Bazard favoured the formation of a political movement, while Enfantin envisioned an apolitical moral and social revolution. Enfantin, often called "Père Enfantin," and his followers formed a model community at Mênilmontant (1832); but the "Père" was imprisoned soon after for sponsoring an illicit secret society and encouraging practices contrary to public morality.

Upon his release, Enfantin and some disciples journeyed to Egypt in search of the eternal *mère suprême* ("supreme mother"). At the same time, they hoped to begin construction of a canal linking the Mediterranean and Red Seas (1837). Failing both, he returned to Paris (1837), and in recognition of his undeniable technical talents, he was appointed to the Scientific Commission on Algeria.

Throughout his life, Enfantin was a prolific writer. In 1829 he published *Doctrine de St. Simon* and in 1831 *Religion Saint-Simonienne. Économie politique et politique* ("St. Simonian Religion. Political Economy and Politics"). This was followed by *Correspondance politique* (1835–40), *Correspondance philosophique et religieuse* (1843–45), and *Colonisation de l'Algérie* (1843). Shortly before his death he wrote *La Vie éternelle, passée, présente, future* (1861), a kind of spiritual testament. In addition, a 47-volume edition of the combined works of St. Simon and Enfantin was published (1865–78).

In 1845, thanks largely to the influence of friends and former students who were now playing an important role in the economic development of France, Enfantin was invited to join in the formation of the new Lyon Railroad Company. He quickly became its first director and leading light. Continuing to be an influential voice in technical and fiscal planning, he was one of the first to advocate the creation of the *Crédit Foncier*, a government promoted bank designed to offer capital at reduced interest rates for socially productive activity.

Enfants sans Souci (French: Carefree Children), one of the largest of the *sociétés joyeuses* of medieval France, an association of the merchants, craftsmen, and students of Paris, founded for the purpose of staging theatrical entertainments and other amusements. Such societies are thought to be descended from the earlier Feast of Fools (*q.v.*), a holiday of the lower clergy that was suppressed in the late Middle Ages.

The members of *Enfants sans Souci*, who performed in the traditional jester's costume of cap and bells and called themselves *sots* ("fools"), marched in comic processions through the streets on holidays and performed satirical farces and morality plays in the public squares. A number of their leaders, who

bore the title of "Prince of Fools," or "Mother Fool," were talented and popular performers, who both wrote and acted in farces. The organization, along with most of the other societies and confraternities that engaged in theatrical activities, gradually died out by the early part of the 17th century.

Enfield, outer borough of London, on its northern perimeter, in the historic county of Middlesex. The eastern part of the borough lies in the valley of the River Lea; the western part is higher and includes the undulating farmland and parkland of Enfield Chase in London's Green Belt. The borough was formed in 1965 by the amalgamation of the former boroughs of Enfield, Edmonton, and Southgate.

Two main traffic arteries cross the borough and are lined with light manufacturing plants. The earlier developed (and canalized) valley of the River Lea has timber yards and associated industries. Enfield also has engineering plants, although the well-known Royal Small Arms

South wall of the Forty Hall in Enfield, London

A.F. Kersting

Factory that produced the Enfield series of rifles is closed. The borough is well connected to central London by suburban rail lines and the London Underground (subway).

The New River, constructed in 1613 to supply water from Hertfordshire to Clerkenwell, London, remains a scenic element in the district, and the Lea valley has been transformed into a green corridor. Forty Hill, a large 17th-century house (now a museum), stands in the town of Forty Hall. Area 32 square miles (82 square km). Pop. (1998 est.) 264,900.

Enfield, town (township), Hartford county, northern Connecticut, U.S., on the Connecticut River at the Massachusetts border. It includes the industrial subdivisions of Thompsonville and Hazardville. The area was settled by a group from Salem, Mass., in 1680 and was named for Enfield, Eng. A surveyor's error in 1642 placed it in Massachusetts, where in 1683 it became a town. After a long boundary dispute, Enfield was annexed to Connecticut in 1749, but it was not until 1804 that the boundary was finally established. The carpet industry, begun by Orrin Thompson about 1828 at Thompsonville, was the economic mainstay until the last mills closed in 1971. The gunpowder industry, developed by Colonel A.G. Hazard (1833), was another early enterprise. Assnuteck Community College was opened (1972) in Enfield. Pop. (2000) 45,212.

Enga, province (established in 1978), west central Papua New Guinea, in the southwestern Pacific. It has an area of 4,900 sq mi (12,800 sq km) and was separated from the Western Highlands district in 1973. Located northeast of the Southern Highlands province, Enga comprises the western half of the central plateaus. It is bounded by the provinces of East Sepik on the north, Madang on the northeast, and Western Highlands on the east. The province consists of rugged mountains and high-altitude valleys. The Schrader Range rises in the northeast, and Mt. Hagen in the south-

east has a height of 12,392 ft (3,777 m). Enga is drained by rapidly flowing rivers, the main one being the Lai and Lagapa. The landscape is marked by wide swaths burned through the forest cover by Papuan hunters in search of small game. The resulting deforestation has extended the areas of grassland dominated by rice grass. Although there were early trade routes from the area south to the Gulf of Papua, the first extended contact with Europeans (from Australia) occurred in 1938. Today, roads link Wabag, the provincial headquarters, with Porgera, location of alluvial gold mines, to the west and with Lae, a port on Huon Gulf, to the southeast. Coffee, vegetables (particularly potatoes), and pyrethrum (used in insecticides) are the principal cash crops. The province has airstrips near many of the towns. Pop. (1990 prelim.) 238,357.

Engadin (German), French *ENGADINE*, Italian *ENGADINA*, Romansh *ENGIADINA*, Swiss portion of the upper Inn (Romansh *En*) River valley, in Graubünden canton, extending about 60 mi (100 km) from the Inn's source near the Maloja Pass (5,955 ft [1,815 m]) northeast to Finstermünz (3,621 ft), near the Austrian border. It is bounded on the south by the Bernina Alps and on the north by the Albulina and Silvretta groups. The valley is divided both administratively and geographically (at the Zernez Gorge) into Upper and Lower Engadin.

There are traces of Bronze Age settlement in the valley. As part of the Roman province of Raetia, it was thoroughly Romanized. During the 4th and 5th centuries territorial sovereignty passed to the bishops of Chur (Coire). The bishop later became a prince of the Holy Roman Empire and allied himself with the Habsburgs. Lower Engadin, not entirely an ecclesiastical domain, was in the 8th century assigned by Charlemagne to the counts of Toggenburg and was absorbed into what came to be known as the county of Tirol, which passed to the Habsburgs in 1363. The Raetian leagues were formed and joined with the Gotteshausbund in 1471 to curtail the power of the Habsburgs. Lower Engadin officially achieved independence with the defeat of the Habsburgs in the battle at Calven Gorge in 1499, but this was not secured until 1652. The Engadin was included in Raetia canton of the Helvetic Republic (1801–03) and in Graubünden canton after 1803.

Because of high elevation the scenery of the Upper Engadin is stark, with no tillage; firs and larches flourish, and the Alpine flora is rich and varied. The chief resources are hay meadows, pastures, and forests. In Lower Engadin tillage is more varied, and grain is grown. There are important reserves of waterpower. Tourism is a major industry. The mineral spring of Sankt Moritz has been famous for centuries, and the Upper Engadin, including the villages of Sils-Maria (with the Friedrich Nietzsche house) and Pontresina, became fashionable in the 19th century as an "air cure" and winter-sports centre. Lower Engadin has two major tourist attractions: the mineral springs of Scuol, below Tarasp, and the Swiss National Park, a wildlife sanctuary.

Because Tarasp remained in the hands of the Habsburgs until 1803, its inhabitants adhered to Roman Catholicism. Easier communications with the Tirol caused Samnaun to adopt Catholicism and German speech. The upper Spöl Valley (Livigno) is Italian speaking. The population is primarily, however, Protestant and Romansh speaking.

Engano (Indonesia): *see* Enggano Island.

Engelbrekt ENGELBREKTSSON (b. c. 1390—d. May 1436, near Örebro, Swed.), Swedish national hero who led a 15th-century rebellion

against Erik of Pomerania, king of the united realms of Denmark, Norway, and Sweden.

Of German origin, Engelbrektsson was a mine owner of the petty nobility from the Bergslagen area of Sweden. When, in the summer of 1434, the Bergslagen miners and peasants rose against the economically ruinous and unconstitutional policies of the absolutist Erik, they chose Engelbrekt as their leader. The early successes of Engelbrekt's forces against Erik's troops encouraged the nobles and clergy to join the rebellion, "Engelbrekt's Feuds," and transform it into a truly national struggle. A truce in November 1434 led to an agreement early in 1435 calling for a return to the pre-rebellion status quo. Although Erik promised to respect Sweden's constitutional rights, it shortly became clear that he had acted in bad faith. When renewed war was decided upon, Engelbrekt, in January 1436, again led his forces against the King's forts, taking Stockholm almost immediately. In the meantime, however, the Swedish nobles had begun to quarrel, and in May 1436 Magnus Bengtsson, an enemy of Engelbrekt, slew him.

The rebels' loss enabled Erik to gain his former position. Continuing discontent, however, and the appeal to the memory of Engelbrekt, whose death had made him a national hero, gave the Swedes the strength necessary to depose Erik by the summer of 1439.

Engelmann, George (b. Feb. 2, 1809, Frankfurt am Main—d. Feb. 4, 1884, St. Louis, Mo., U.S.), U.S. botanist, physician, and meteorologist who is known primarily for his botanical monographs, especially one on the cactus and also *A Monograph of North American Cuscutinae* (1842).

Engelmann studied at the universities of Heidelberg and Berlin and received his M.D. degree from the University of Würzburg in 1831. His illustrated thesis, *De Antholysii Prodrumus*, was an important study of the morphology of monstrosities. He went to the United States in 1833, and in 1835 he settled in St. Louis, where he became a leading physician. Continuing his studies in biology, he pointed out the adaptation of the pronuba moth for pollinating yuccas and made the economically important discovery of the immunity of the North American grape to the plant lice *Phylloxera*. His systematic meteorological observations, begun in 1836, were a pioneering effort that he continued until his death. Much of his work was assembled in *The Botanical Works of the Late George Engelmann Collected for Henry Shaw* (1887).

Engels, city, Saratov oblast (province), western Russia. The city is situated on the left bank of the Volga River, opposite Saratov, to which it is connected by a highway bridge (completed 1965). Founded in 1747 as Pokrovskaya *sloboda* (military settlement), the city was the capital of the former Volga-German Republic from 1922 to 1941, being renamed Engels in 1931. Engels is the main trolley bus-manufacturing centre in Russia, and the city also produces artificial fibres, rolling stock, and diesel motors. Local agricultural products, especially meat, are processed there. Many workers commute from Engels to Saratov. Pop. (1991 est.) 183,600.

Engels, Friedrich (b. Nov. 28, 1820, Barmen, Rhine Province, Prussia—d. Aug. 5, 1895, London), German Socialist philosopher, the closest collaborator of Karl Marx in the foundation of modern Communism. They co-authored the *Communist Manifesto* (1848), and Engels edited the second and third volumes of *Das Kapital* after Marx's death.

Early life. Engels grew up in the environment of a family marked by moderately liberal

Engels, detail of a portrait by H. Schey
Novosti Press Agency

political views, a steadfast loyalty to Prussia, and a pronounced Protestant faith. His father was the owner of a textile factory in Barmen and also a partner in the Ermen & Engels cotton plant in Manchester, Eng. Even after Engels openly pursued the revolutionary goals that threatened the traditional values of the family, he usually could count on financial aid from home. The influence of his mother, to whom he was devoted, may have been a factor in preserving the tie between father and son.

Aside from such disciplinary actions as the father considered necessary in rearing a gifted but somewhat rebellious son, the only instance in which his father forced his will on Engels was in deciding upon a career for him. Engels did attend a *Gymnasium* (secondary school), but he dropped out a year before graduation, probably because his father felt that his plans for the future were too undefined. Engels showed some skill in writing poetry, but his father insisted that he go to work in the expanding business. Engels, accordingly, spent the next three years (1838–41) in Bremen acquiring practical business experience in the offices of an export firm.

In Bremen, Engels began to show the capacity for living the double life that characterized his middle years. During regular hours, he operated effectively as a business apprentice. An outgoing person, he joined a choral society, frequented the famed *Ratskeller*, became an expert swimmer, and practiced fencing and riding (he outrode most Englishmen in the fox hunts). Engels also cultivated his capacity for learning languages; he boasted to his sister that he knew 24. In private, however, he developed an interest in liberal and revolutionary works, notably the banned writings of "Young German" authors such as Ludwig Börne, Karl Gutzkow, and Heinrich Heine. But he soon rejected them as undisciplined and inconclusive in favour of the more systematic and all embracing philosophy of Hegel as expounded by the "Young Hegelians," a group of leftist intellectuals, including the theologian and historian Bruno Bauer and the anarchist Max Stirner. They accepted the Hegelian dialectic—basically that rational progress and historical change result from the conflict of opposing views, ending in a new synthesis. The Young Hegelians were bent on accelerating the process by criticizing all that they considered irrational, outmoded, and repressive. As their first assault was directed against the foundations of Christianity, they helped convert an agnostic Engels into a militant atheist, a relatively easy task since by this time Engels' revolutionary convictions made him ready to strike out in almost any direction.

In Bremen, Engels also demonstrated his talent for journalism by publishing articles under the pseudonym of Friedrich Oswald, perhaps to spare the feelings of his family. He pos-

sessed pungent critical abilities and a clear style, qualities that were utilized later by Marx in articulating their revolutionary goals.

After returning to Barmen in 1841, the question of a future career was shelved temporarily when Engels enlisted as a one-year volunteer in an artillery regiment in Berlin. No antimilitarist disposition prevented him from serving commendably as a recruit; in fact, military matters later became one of his specialties. In the future, friends would often address him as "the general." Military service allowed Engels time for more compelling interests in Berlin. Though he lacked the formal requirements, he attended lectures at the university. His Friedrich Oswald articles gained him entrée into the Young Hegelian circle of The Free, formerly the Doctors Club frequented by Karl Marx. There he gained recognition as a formidable protagonist in the philosophical battles, mainly directed against religion.

Conversion to communism. After his discharge in 1842, Engels met Moses Hess, the man who converted him to communism. Hess, the son of wealthy Jewish parents and a promoter of radical causes and publications, demonstrated to Engels that the logical consequence of the Hegelian philosophy and dialectic was communism. Hess also stressed the role that England, with its advanced industry, burgeoning proletariat, and portents of class conflict, was destined to play in future upheavals. Engels eagerly seized the opportunity to go to England, ostensibly to continue his business training in the family firm in Manchester.

In England (1842–44), Engels again functioned successfully in business. After hours, however, he pursued his real interests: writing articles on communism for continental and English journals, reading books and parliamentary reports on economic and political conditions in England, mingling with workers, meeting radical leaders, and gathering materials for a projected history of England that would stress the rise of industry and the wretched position of the workers.

In Manchester, Engels established an enduring attachment to Mary Burns, an uneducated Irish working girl, and, though he rejected the institution of marriage, they lived together as husband and wife. In fact, the one serious strain in the Marx-Engels friendship occurred when Mary died in 1863 and Engels thought that Marx responded a little too casually to the news of her death. In the future, however, Marx made a point of being more considerate, and, when Engels later lived with Mary's sister Lizzy, on similar terms, Marx always carefully closed his letters with greetings to "Mrs. Lizzy" or "Mrs. Burns." Engels finally married Lizzy, but only as a deathbed concession to her.

In 1844 Engels contributed two articles to the *Deutsch-Französische Jahrbücher* ("German-French Yearbooks"), which were edited by Marx in Paris. In them Engels put forth an early version of the principles of scientific socialism. He revealed what he regarded as the contradictions in liberal economic doctrine and set out to prove that the existing system based on private property was leading to a world made up of "millionaires and paupers." The revolution that would follow would lead to the elimination of private property and to a "reconciliation of humanity with nature and itself."

Partnership with Marx. On his way to Barmen, Engels went to Paris for a 10-day visit with Marx, whom he had earlier met in Cologne. This visit resulted in a permanent partnership to promote the socialist movement. Back in Barmen, Engels published *Die Lage der arbeitenden Klasse in England* (1845; *The Condition of the Working Class in England in 1844*, 1887), a classic in a field that later became Marx's specialty. Their first

major joint work was *Die deutsche Ideologie* (1845; *The German Ideology*), which, however, was not published until more than 80 years later. It was a highly polemical critique that denounced and ridiculed certain of their earlier Young Hegelian associates and then proceeded to attack various German socialists who rejected the need for revolution. Marx's and Engels' own constructive ideas were inserted here and there, always in a fragmentary manner and only as corrective responses to the views they were condemning.

Upon rejoining Marx in Brussels in 1845, Engels endorsed his newly formulated economic, or materialistic, interpretation of history, which assumed an eventual communist triumph. That summer he escorted Marx on a tour of England. Thereafter he spent much time in Paris, where his social engagements did not interfere significantly with his major purpose, that of attempting to convert various émigré German worker groups—among them a socialist secret society, the League of the Just—as well as leading French socialists to his and Marx's views. When the league held its first congress in London in June 1847, Engels helped bring about its transformation into the Communist League.

Marx and he together persuaded a second Communist Congress in London to adopt their views. The two men were authorized to draft a statement of communist principles and policies, which appeared in 1848 as the *Manifest der kommunistischen Partei* (commonly called the *Communist Manifesto*). It included much of the preliminary definition of views prepared earlier by Engels in the *Grundsätze des Kommunismus* (1847; *Principles of Communism*) but was primarily the work of Marx.

The Revolution of 1848, which was precipitated by the attempt of the German states to throw off an authoritarian, almost feudal, political system and replace it with a constitutional, representative form of government, was a momentous event in the lives of Marx and Engels. It was their only opportunity to participate directly in a revolution and to demonstrate their flexibility as revolutionary tacticians with the aim of turning the revolution into a communist victory. Their major tool was the newspaper *Neue Rheinische Zeitung*, which Marx edited in Cologne with the able assistance of Engels. Such a party organ, then appearing in a democratic guise, was of prime importance for their purposes; with it they could furnish daily guidelines and incitement in the face of shifting events, together with a sustained criticism of governments, parties, policies, and politicians.

After the failure of the revolution, Engels and Marx were reunited in London, where they reorganized the Communist League and drafted tactical directives for the communists in the belief that another revolution would soon take place. But how to replace his depleted income soon became Marx's main problem. To support both himself and Marx, he accepted a subordinate position in the offices of Ermen & Engels in Manchester, eventually becoming a full-fledged partner in the concern. He again functioned successfully as a businessman, never allowing his communist principles and criticism of capitalist ways to interfere with the profitable operations of his firm. Hence he was able to send money to Marx constantly, often in the form of £5 notes, but later in far higher figures. When Engels sold his partnership in the business in 1869, he received enough for it to live comfortably until his death in 1895 and to provide Marx with an annual grant of £350, with the promise of more to cover all contingencies.

Engels, who was forced to live in Manchester, corresponded constantly with Marx in London and frequently wrote newspaper articles for him; he wrote the articles that appeared in the *New York Tribune* (1851–52) under Marx's name and that were later

published under Engels' name as *Revolution and Counter-Revolution in Germany in 1848* (1896). In the informal division of labour that the two protagonists of communism had established, Engels was the specialist in nationality questions, military matters, to some extent in international affairs, and in the sciences. Marx also turned to him repeatedly for clarification of economic questions, notably for information on business practices and industrial operations.

Marx's *Das Kapital* (*Capital*), his most important work, bears in part a made-in-Manchester stamp. Marx similarly called on Engels' writing facility to help "popularize" their joint views. While Marx was the brilliant theoretician of the pair, it was Engels, as the apt salesman of Marxism directing attention to *Das Kapital* through his reviews of the book, who implanted the thought that it was their "bible." Engels almost alone wrote *Herrn Eugen Dührings Umwälzung der Wissenschaft* (1878; *Herr Eugen Dühring's Revolution in Science [Anti-Dühring]*), the book that probably did most to promote Marxian thought. It destroyed the influence of Karl Eugen Dühring, a Berlin professor who threatened to supplant Marx's position among German Social Democrats.

Last years. After Marx's death (1883), Engels served as the foremost authority on Marx and Marxism. Aside from occasional writings on a variety of subjects and introductions to new editions of Marx's works, Engels completed volumes 2 and 3 of *Das Kapital* (1885 and 1894) on the basis of Marx's uncompleted manuscripts and rough notes. Engels' other two late publications were the books *Der Ursprung der Familie, des Privateigentums und des Staats* (1884; *The Origin of the Family, Private Property and the State*) and *Ludwig Feuerbach und der Ausgang der klassischen deutschen Philosophie* (1888; *Ludwig Feuerbach and the Outcome of Classical German Philosophy*). All the while he corresponded extensively with German Social Democrats and followers everywhere, so as to perpetuate the image of Marx and to foster some degree of conformity among the "faithful." His work was interrupted when he was stricken with cancer, he died of the disease not long after.

During his lifetime, Engels experienced, in a milder form, the same attacks and veneration that fell upon Marx. An urbane individual with the demeanour of an English gentleman, Engels customarily was a gay and witty associate with a great zest for living. He had a code of honour that responded quickly to an insult, even to the point of violence. As the hatchetman of the "partnership," he could be most offensive and ruthless, so much so that in 1848 various friends attempted unsuccessfully to persuade Marx to disavow him.

Except for the communist countries, where Engels has received due recognition, posterity has generally lumped him together with Marx without adequately clarifying Engels' significant role. The attention Engels does receive is likely to be in the form of a close scrutiny of his works to discover what differences existed between him and Marx. As a result, some scholars have concluded that Engels' writings and influence are responsible for certain deviations from, or distortions of, "true Marxism" as they see it. Yet scholars in general acknowledge that Marx himself apparently was unaware of any essential divergence of ideas and opinions. The Marx-Engels correspondence, which reveals a close cooperation in formulating Marxist policies, bears out that view.

revisionism, and *Friedrich Engels: His Life and Thought* (1989); and J.D. Hunley, *The Life and Thought of Friedrich Engels: A Reinterpretation* (1991).

Enggano Island, Indonesian PULAU ENGGANO, Enggano also spelled ENGGANO, island in the Indian Ocean, off the southwestern coast of Sumatra, Bengkulu *provinsi* ("province"), Indonesia. Enggano lies about 110 miles (177 km) south of Bengkulu city. It is about 22 miles (35 km) long east-west and 10 miles (16 km) wide north-south and covers an area of 171 square miles (443 square km). Its average elevation is about 330 feet (100 m). Hills, rising to about 922 feet (281 m), cover most of the area and are thickly forested in hardwood. The climate is hot and moist, with heavy precipitation throughout the year. The low-lying coastal areas have coconut plantations; timber and copra are exported. Enggano is sparsely populated; Barhau and Kayaapu are the principal settlements.

Engghalskrug, German faience ewer with an ovoid body and a long narrow neck, which has a hinged pewter lid, a slight lip, and a broad foot, usually bound with a ring of pewter. After having been developed as a specialty at Hanau, *Engghalskrüge* were made at a number of German factories in the 17th and 18th centuries. There are many local variations

Engghalskrug from Hanau, Ger., c. 1700; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

in shape and style: the long-necked jugs of Frankfurt, for instance, are large-bellied with a spreading neck and a thin, twisted handle; those of Ansbach have long, pointed handles; those of Nürnberg are pear-shaped with semi-circular handles. Those of Künersberg, with a brilliant white glaze, are of great elegance.

Enghien (French), Flemish EDINGEN, municipality, Hainaut province, southwest-central Belgium, 16 miles (26 km) southwest of Brussels. Established in the 11th century and a French possession until 1606, it was a medieval commercial centre noted for its tapestry. Modern industries include lace making and linen weaving. The title "duc d'Enghien" was long borne by the eldest son of the nearby princely house of Condé, even after the ancestral castle (the dungeon of which survives as a chapel) and park were sold to the house of Arenberg at the start of the 17th century. The

superb park at Enghien was created by Antoine d'Arenberg, son of Charles d'Arenberg and Anne de Croy, who bought the estate in 1606 from Henry IV, king of France. Pop. (1990 est.) mun., 10,160.

Enghien, Henri-Jules de Bourbon, Duke (duc) d': *see* Condé. Henri-Jules de Bourbon, 5^c Prince de.

Enghien, Louis-Antoine-Henri de Bourbon-Condé, Duke (duc) d' (b. Aug. 2, 1772, Chantilly, Fr.—d. March 21, 1804, Vincennes), French prince whose execution, widely proclaimed as an atrocity, ended all hope of reconciliation between Napoleon and the royal house of Bourbon.

The only son of Louis-Henri-Joseph, Duke de Bourbon, and Louise-Marie-Thérèse-Bathilde d'Orléans, he emigrated with his father at the outbreak of the French Revolution and served in his grandfather's émigré army from 1792 until its dissolution after the Treaty of Lunéville (1801). He secretly married Charlotte de Rohan-Rochefort and settled at Ettenheim, in Baden.

In 1804 Napoleon, then first consul, received intelligence that connected the Duke d'Enghien with the conspiracy to overthrow him then being planned by Georges Cadoudal and Charles Pichegru. The report was false, but Napoleon ordered Enghien's arrest, and French gendarmes crossed the Rhine secretly and seized him. He was brought to the castle of Vincennes near Paris, where a court-martial was hurriedly gathered to try him, and he was shot about a week after his arrest. Though his father survived him, the Duke d'Enghien was genealogically the last prince of the house of Condé.

The indignation that the execution aroused throughout Europe provoked the often quoted and misquoted comment upon the execution, "*C'est pire qu'un crime, c'est une faute*" ("It's worse than a crime, it's a mistake").

Engholm, Björn (b. Nov. 9, 1939, Lübeck, Ger.), German politician who became the leader of the Social Democratic Party in 1991.

Of Swedish descent, Engholm was educated at the University of Hamburg and worked as a printer before becoming a freelance journalist and lecturer in 1964. He had joined the Social Democratic Party in 1962, and he was first elected to the National Assembly (Bundestag) in 1969, winning reelection successively thereafter. In 1981–82 he was minister of education and science in the government of his mentor, the Social Democratic leader Helmut Schmidt. After the Schmidt government fell from power in 1982, Engholm ran unsuccessfully for prime minister of his home state of Schleswig-Holstein in 1983 and 1987 before winning a second, special election to that post late in 1987. In 1990 Engholm was chosen to succeed Hans-Jochen Vogel as chairman of the Social Democratic Party, and his appointment as its leader was confirmed in a party conference in 1991.

Engiadina (Switzerland): *see* Engadin.

engine, a machine that can convert any of various forms of energy into mechanical power or motion. *See* diesel engine; gasoline engine; internal-combustion engine; jet engine; rocket; rotary engine; steam engine.

engineering: *see under* descriptive word (e.g., chemical engineering, industrial engineering, nuclear engineering), except as below.

engineering, the application of scientific principles to the optimal conversion of natural resources into structures, machines, products, systems, and processes for the benefit of humankind.

A brief treatment of engineering follows. For

full treatment, *see* MACROPAEDIA: Engineering.

Engineering is one of the oldest professions in the world; there are a plethora of examples of spectacular engineering feats dating back to ancient times, the best known being the pyramids of ancient Egypt.

There are traditionally four primary engineering disciplines, namely civil, mechanical, electrical, and chemical engineering, each of these having several distinct specialized branches. Other important and distinct engineering disciplines are concerned with mining, nuclear technology, and environmental control.

The oldest of the four main disciplines is civil engineering, which developed from techniques used in the ancient world. It is concerned with the design, site preparation, and construction of all types of structures and facilities, such as bridges, roads, tunnels, harbours, and airfields. Most of the projects involving civil engineering are undertaken by the public sector and are concerned with the development of urban, regional, and national infrastructures. Within the overall context of civil engineering there are several specialized branches, such as structural engineering, foundation engineering, public health and sanitary engineering, and irrigation engineering. Municipal and traffic engineering are more recent specializations.

The spread of the Industrial Revolution in the first half of the 19th century resulted in the evolution of mechanical engineering as a distinct discipline that is concerned with the design, development, and testing of all types of industrial machinery and engines. This discipline has likewise evolved into many diverse specializations, such as automotive, aeronautical, and marine engineering. Precision engineering and production engineering are other important subdisciplines of mechanical engineering, as is agricultural engineering.

Electrical engineering, covering the design and installation of main electrical systems, evolved during the latter part of the 19th century, when electrical technology began making rapid strides. Since that time, various specialties within the electrical-engineering spectrum have emerged, such as electronics engineering, communications engineering (which includes radio and television), and instrument engineering. More recent specialties within the electrical-engineering field include medical engineering and computer engineering.

The newest of the four basic engineering disciplines is chemical engineering. Although the basic concepts were propounded a century ago, the main stimulant to its evolution was the development of the oil industry and the use of oil-derived products as raw materials for the chemical industry over the last 50 years or so. The discipline is concerned with the design of processes and equipment for the large-scale conversion of petroleum components by means of chemical reactions; its specialty areas include process engineering and petroleum engineering. Chemical engineering differs from the other three major classes of engineering in that it adds a third science (chemistry) to the two cornerstones of engineering, mathematics and physics.

Between these diverse fields of engineering there is inevitably some overlap of interest and expertise. It is, however, common to all branches of engineering that academic training must begin with a thorough grounding in the fundamental principles of science, particularly mathematics and physics. Education may then be continued in general engineering subjects, including draftsmanship. There is naturally a differing emphasis in these subjects according to the branch of engineering selected by the student.

All engineers must have a positive interest in the translation of the theoretical into the practical. Not only is an appropriate basic academic qualification necessary to enter the

profession but a considerable period of time must be spent in gaining practical experience before the engineer can be considered properly qualified in the profession.

Engineers of some kind can be found in virtually every type of manufacturing and processing industry appropriate to their skills, as well as in public service and in many of the service industries. However, there are considerable variations in the definition and status of the professional engineer among different countries, these being due primarily to historical reasons. Whereas in many countries (such as Germany and the United States), the engineer may be accorded a professional status similar to that of a lawyer or a physician, in others until the late 20th century the term engineer was synonymous with that of a mechanic.

engineering drawing: *see* drafting.

engineering geology, also called GEOLOGICAL ENGINEERING, the scientific discipline concerned with the application of geological knowledge to engineering problems—e.g., to reservoir design and location, determination of slope stability for construction purposes, and determination of earthquake, flood, or subsidence danger in areas considered for roads, pipelines, or other engineering works.

England, predominant country of the United Kingdom of Great Britain and Northern Ireland. It occupies more than half the island of Great Britain. It is bounded on the north by Scotland; on the west by the Irish Sea, Wales, and the Atlantic Ocean; on the south by the English Channel; and on the east by the North Sea.

A brief treatment of England follows. For full treatment, *see* MACROPAEDIA: United Kingdom.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

Physical and human geography. Constitutionally, England does not exist. It is not mentioned in the title of the sovereign who rules "the United Kingdom of Great Britain and Northern Ireland and of Her other Realms and Territories." Scotland, Wales, and Northern Ireland have certain governmental institutions of their own, but England, having subsumed or created those institutions at one time or another, needs no special mention. Holding more than four-fifths of the population, however, England's dominance in the United Kingdom is beyond question.

London was the largest town in Roman Britain and has been the capital of a unified England since the Norman Conquest of 1066. England has played a dominant role in British history since that time.

England is a land of low hills and plateaus and a 2,000-mile (3,200-kilometre) coastline cut into by bays, coves, and estuaries. A substantial upland, the Pennines (Scafell Pike, 3,210 feet [975 m]), with moorland tops rising to between 2,000 and 3,000 feet (600 to 900 m), splits northern England into northwestern and northeastern sectors.

English weather is diverse, with a generally mild but erratic temperate maritime climate. Temperatures in the Thames River valley range from about 35° F (2° C) in January to 69°–72° F (21°–22° C) in July. The extremes recorded in England, however, go below 0° F (–18° C) and above 90° F (32° C). Northeastern and central England receive less than 40 inches (1,000 mm) of rainfall annually, and in parts of southeastern England annual rainfall averages as little as 20 inches (500 mm). Winter snows are sometimes heavy, but England frequently suffers from summer drought.

The English people are a mixed lot, their language polyglot with respect to source. Basically, the language of Anglo-Saxon invaders of the 5th and 6th centuries has prevailed,

providing about half the words in the modern English vocabulary. The remainder have come mainly from French and Latin. The English have absorbed numerous conquerors, as well as the Scots, Irish, and Welsh. Jews, too, have settled in England in large numbers, and recent immigration has added peoples from Pakistan, Africa, and the Caribbean islands to the English population.

England has eight geographic regions, often referred to as the standard regions of England; they do not serve any administrative function. The South East, centred on London, is an economically dominant area. Its economy rests principally on financial and business services, trade, research, and high-technology industries. Approximately one-third of the region is devoted to agriculture, including dairy farming and the production of hops. London is the hub of the nation's railroad and airline system, with three international airports: Heathrow, Gatwick, and Stansted. The Port of London is the largest and commercially most important port in Britain.

The West Midlands, in west-central England, is a diversified agricultural, service, and manufacturing region that centres on Birmingham, where automotive-vehicle manufacturing is important. The region also includes the Shropshire country, centred on Stratford-upon-Avon. The East Midlands, in east-central England, is also a manufacturing region, featuring hosiery and knitwear, bicycle, pharmaceutical, and aircraft industries. The region contains coalfields and some of England's best farmland. East Anglia is the easternmost part of England. It is mainly an agricultural region producing cereals, potatoes, and sugar beets, but high-technology industries have developed there.

Manchester and Liverpool are the chief manufacturing cities of the North West, and Liverpool is an important port. This region is known for textile manufacturing, an industry that has largely given way to engineering industries and service activities. The North West also includes the Lake District, renowned for its natural beauty. The Yorkshire and Humberside region lies to the east and contains the conurbation of West Yorkshire (including the cities of Leeds and Bradford), where the manufacture of textiles has long been an important occupation. Steel making is found at Sheffield, noted especially for its cutlery, and the region also has chemical and engineering industries and extensive farmland. The North East extends northward from Yorkshire and Humberside to the Scottish border. It comprises the manufacturing cities of the Teesside and Tyne-side regions, including Newcastle upon Tyne, and extensive scenic uplands.

The South West, including the last Celtic stronghold in England—Cornwall—is a largely agricultural area, specializing in livestock raising, whose economy rests increasingly on service activities. The counties of the South West also enjoy a large share of the expanding tourist industry, and those portions of the region closest to London are becoming increasingly industrialized.

England's internationally renowned universities—especially Cambridge and Oxford—lay claim to many achievements in science and technology. English physicists at Cambridge were the first to split the atom, and geneticists there discovered the structure of the DNA molecule. English scientists and technicians have been responsible for penicillin, radar, advanced aircraft design, and the jet engine.

England is especially noted for its long and rich literary tradition, as well as for its architecture, painting, theatres, and museums. London is the nation's leading centre for radio and television broadcasting, for book and other publishing, and for contemporary drama. In addition to its well-deserved reputation for intellectual and artistic life, England gave to the world the sports of cricket, associ-

ation football (soccer), and rugby football. Area 50,363 square miles (130,439 square km). Pop. (1998 est.) 49,494,600.

England, Bank of, the central bank of the United Kingdom. Its headquarters are in the financial district of City of London.

The Bank of England was incorporated by act of Parliament in 1694 with the immediate purpose of raising funds to allow England to wage war against France in the Low Countries in the War of the Grand Alliance. A royal charter allowed the bank to operate as a joint-stock bank with limited liability. No other joint-stock banks were permitted in England and Wales until 1826. This special status and its position as the government's banker gave the bank considerable competitive advantages.

By the time it moved to its present location in Threadneedle Street in 1730, it had become the largest and most prestigious financial institution in England, and its bank notes were widely circulated. As a result it became banker to other banks, which, by maintaining balances with the Bank of England, could settle debts among themselves. The bank's standing was considerably enhanced by its actions in raising finance for the Napoleonic Wars.

During the 19th century the bank gradually assumed the responsibilities of a central bank. In 1833 it began to print legal tender, and it undertook the roles of lender of last resort and guardian of the nation's gold reserves in the following few decades.

The bank was privately owned until 1946, when it was nationalized. Headed by a governor and court of directors, the bank funds public borrowing, issues bank notes, and manages the country's gold and foreign exchange reserves. It formulates monetary policy for the United Kingdom, which it implements through its dealings in the money, bond, and foreign exchange markets. It gained freedom of action on monetary policy in 1997, when the government granted it the power to determine short-term interest rates.

England, Church of, English national church that traces its history back to the arrival of Christianity in Britain during the 2nd century; it has been the original church of the Anglican Communion (*q.v.*) since the 16th-century Protestant Reformation. As the successor of the Anglo-Saxon and medieval English church, it has valued and preserved much of the traditional framework of medieval Roman Catholicism in church government, liturgy, and customs, while it also has usually held the fundamentals of Reformation faith.

The conversion of the Anglo-Saxons, who began invading Britain after Rome stopped governing the country in the 5th century, was undertaken by St. Augustine, a monk in Rome chosen by Pope Gregory I to lead a mission to the Anglo-Saxons. He arrived in 597, and within 90 years all the Saxon kingdoms of England had accepted Christianity.

In the centuries before the Reformation, the English church experienced periods of advancement and of decline. During the 8th century, English scholarship was highly regarded, and several English churchmen worked in Europe as scholars, reformers, and missionaries. Subsequently, Danish invasions destroyed monasteries and weakened scholarship. Political unity in England was established under the Wessex kings in the 10th century, however, and reforms of the church took place.

In the 11th century the Norman Conquest of England (1066) united England more closely with the culture of Latin Europe. The English church was reformed according to Roman ideas: local synods were revived, celibacy of the clergy was required, and the canon law of western Europe was introduced in England.

During the Middle Ages, English clergy and laity made important contributions to the life

and activities of the Roman Catholic church. The English church, however, shared in the religious unrest characteristic of the later Middle Ages. John Wycliffe, the 14th-century Reformer and theologian, became a revolutionary critic of the papacy and is considered a major influence on the 16th-century Protestant Reformation.

The break with the Roman papacy and the establishment of an independent Church of England came during the reign of Henry VIII (1509–47). When Pope Clement VII refused to approve the annulment of Henry's marriage to Catherine of Aragon, the English Parliament, at Henry's insistence, passed a series of acts that separated the English church from the Roman hierarchy and in 1534 made the English monarch the head of the English church. The monasteries were suppressed, but few other changes were immediately made, since Henry intended that the English church would remain Catholic, though separated from Rome.

After Henry's death, Protestant reforms of the church were introduced during the six-year reign of Edward VI. In 1553, however, when Edward's half-sister, Mary, a Roman Catholic, succeeded to the throne, her repression and persecution of Protestants aroused sympathy for their cause. When Elizabeth I became queen in 1558, the independent Church of England was reestablished. *The Book of Common Prayer* (*q.v.*; 1549, final revision 1662) and the Thirty-nine Articles (*q.v.*; 1571) became the standards for liturgy and doctrine.

In the 17th century the Puritan movement led to the English Civil Wars (1642–51) and the Commonwealth (1649–60). The monarchy and the Church of England were repressed, but both were restored in 1660.

The Evangelical movement in the 18th century emphasized the Protestant heritage of the church, while the Oxford Movement in the 19th century emphasized the Roman Catholic heritage. These two attitudes have continued in the church and are sometimes referred to as Low Church and High Church, respectively. In the 20th century the church was active in the ecumenical movement.

The Church of England has maintained the episcopal form of government. It is divided into two provinces, Canterbury and York, each headed by an archbishop, with Canterbury taking precedence over York. Provinces are divided into dioceses, each headed by a bishop and made up of several parishes. Women deacons, known originally as deaconesses and serving basically as assistants to priests, were first ordained by the Church of England in 1987, allowing them to perform virtually all clerical functions except the celebration of the Eucharist. The church voted in 1992 to ordain women as priests; the first ordination, of 32 women, took place in 1994 at Bristol Cathedral.

England, John (b. Sept. 23, 1786, Cork, County Cork, Ire.—d. April 11, 1842, Charleston, S.C., U.S.), Irish-born American Roman Catholic prelate who became the first bishop of Charleston and who founded the first Roman Catholic newspaper in the United States.

Ordained in 1808, England became an instructor at St. Patrick's Seminary, Cork, where in 1812 he was made president. His outspoken opposition to governmental intervention in the selection of Irish and English bishops displeased some of his superiors, and he was transferred in 1817 to the nearby village of Brandon as parish priest.

While serving there, he was named bishop of the new diocese of Charleston—comprising the states of North Carolina, South Carolina, and Georgia—and was consecrated in Ireland

(Sept. 21, 1820). Seeing that the first need of his diocese was education, he prepared and printed a catechism and a missal for Americans. He founded the *United States Catholic Miscellany*, the first Roman Catholic newspaper in the United States, which continued publication until 1861. He began two schools: the Philosophical and Classical Seminary for boys and an academy, conducted by the Ursulines, for girls. For the care of the sick and orphans he founded a religious community, the Sisters of Our Lady of Mercy. To assist immigrants and workmen he organized the Brotherhood of San Marino. His attempt to found a school for free blacks was blocked by public opposition.

In 1833 England was appointed apostolic delegate to Haiti, the first important diplomatic mission given to a prelate in the United States. His efforts to secure a concordat were, however, unsuccessful. An eloquent orator, he was the first Roman Catholic clergyman invited to speak before the U.S. Congress (1826), where for two hours he described the doctrines of his church. He became a U.S. citizen in 1826.

Engle, Robert F. (b. Nov. 1942, Syracuse, N.Y.), American economist, corecipient of the Nobel Prize for Economics in 2003 for his development of methods for analyzing time series data with time-varying volatility. He shared the award with Clive W.J. Granger.

Engle received an M.S. (1966) and a Ph.D. (1969) from Cornell University. He taught at the Massachusetts Institute of Technology (1969–75) before joining the University of California at San Diego, where he became professor in 1977 and later the chair in economics. In 1999 he began teaching at the Stern School of Business at New York University.

Engle conducted much of his prizewinning work in the 1970s and '80s, developing improved mathematical techniques for the evaluation and more accurate forecasting of risk, which enabled researchers to test if and how volatility in one period was related to volatility in another period. This had particular relevance in financial market analysis in which the investment returns of an asset were assessed against its risks and stock prices and returns could exhibit extreme volatility. Inherent in Engle's autoregressive conditional heteroskedasticity (known as ARCH) model approach was the concept that while most volatility is embedded in the random error, its variance depends on previously realized random errors, with large errors being followed by large errors and small by small. This contrasted with earlier models wherein the random error was assumed to be constant over time.

Englefield, Sir Francis (b. c. 1520—d. 1596), English Roman Catholic who was a personal friend and influential adviser to Queen Mary I and a vigorous opponent in exile of Queen Elizabeth I.

During the reign of Henry VIII, Englefield accepted the principle of royal supremacy over the English church but rejected the Protestant doctrines imposed under King Edward VI. He befriended Mary Tudor, the Roman Catholic heir to the throne, and, upon her accession, she appointed Englefield a privy councillor. His influence with the queen helped bring about the severe persecutions of Protestants that marked her reign.

When Queen Elizabeth came to power in 1558, Englefield fled to the European continent, where he became a confidant of such notable Roman Catholic exiles as William Cardinal Allen and Robert Parsons. Eventually he advocated forcible intervention by Spain to restore Roman Catholicism in England. During the last 20 years of his life Englefield, suffering from blindness, lived in Spain on a pension from the Spanish king Philip II.

Engler, Adolf, in full GUSTAV HEINRICH ADOLF ENGLER (b. March 25, 1844, Sagan, Prussia [now Żagań, Pol.]—d. Oct. 10, 1930, Berlin, Ger.), German botanist famous for his system of plant classification and for his expertise as a plant geographer.

Engler obtained a Ph.D. from the University of Breslau (now Wrocław) in 1866. After four years of teaching he became, in 1871, custodian of botanical collections of the Botanical Institute of Munich, remaining there until 1878, when he accepted a professorship at the University of Kiel. In 1884 he was appointed professor of botany and director of the botanical garden of the University of Breslau. From 1889 to 1921 he was director of the Berlin Botanical Garden, Dahlem, which he made one of the foremost botanical gardens in the world. He visited Africa in 1902, 1905, and 1913; India and Java in 1905; and in 1913 made a journey around the world.

Engler was a great administrator and the leader of German taxonomic and geographic botany. He collaborated with Karl Friedrich Philipp von Martius in the *Flora Brasiliensis* (1861–1906; "The Flora of Brazil") and with Alphonse de Candolle in the *Monographiae Phanerogamarum* (1878–91; "Monographs of Flowering Plants"). His greatest contribution to taxonomy is his monumental *Die natürlichen Pflanzenfamilien* ("The Natural Plant Families") edited with Karl von Prantl and others (published in parts, 1887–1911), followed by *Das Pflanzenreich* (1900–37; "The Plant Kingdom"). In these works, Engler provided a comprehensive system of classification whose arrangements of plant orders and families became widely accepted. Engler's *Syllabus der Pflanzennamen* (1892; "Syllabus of Plant Names") is still a standard and indispensable reference book. He also founded the *Botanische Jahrbücher* ("Botanical Yearbooks"), which he edited from 1880.

Englewood, city, Bergen county, northeastern New Jersey, U.S. It lies across the Hudson River from the Bronx, New York City. Founded in 1647 as part of Hackensack, it was detached for urban development as the township of Englewood in 1871, incorporated as a city in 1895, and again in 1899 after the discovery of a constitutional flaw in the 1895 act. Englewood is mainly residential but has light manufactures (leather goods, drugs, metal products). The Actors' Fund Home for sick and retired actors was established there in 1928. In 1951 the city's telephone system became the first in the United States to offer direct dialing for long-distance calls. The adjacent borough of Englewood Cliffs (south) contains the headquarters of the Prentice-Hall publishing complex. Pop. (2003 est.) 26,106.

Englische Komödianten (German: "English Comedians"), any of the troupes of English actors who toured the German-speaking states during the late 16th and the 17th centuries, exerting an important influence on the embryonic German drama and bringing with them many versions of popular Elizabethan and Jacobean plays that are of particular interest to modern scholars. One of the earliest English troupes to visit Europe was that led by Robert Brown, formerly a member of Worcester's Men. Brown's actors performed at Leiden in 1591 and by the following year had attracted the patronage of the playwright-duke Heinrich Julius of Brunswick. Several of the duke's subsequent dramas are thought to contain plot elements from some of the plays of William Shakespeare. Other groups of English actors quickly followed Brown, touring throughout central Europe. The English professionals, with their elaborate costumes, properties, and full repertoires of new plays, were immediately successful with German audiences. The English clowns were especially popular, and one of them, Robert Reynolds (fl. 1610–40), was such a favourite that his comic character,

Troupe of the Englische Komödianten appearing on an improvised stage, engraving by Hans Tröschel, 1623

By courtesy of William W. Melnitz

called Pickelherring, became a stock figure in German farces. The actors overcame the language barrier with the aid of an interpreter and by much use of mime and crude slapstick, violent action, and extravagant emotion. Later actors learned German and joined with German writers in clumsy and macaronic translations of their plays.

Except for the period of the Thirty Years' War (1618–48), the English companies flourished during the 17th century. They gradually augmented themselves with native actors and actresses, training many of the German professionals who eventually succeeded them.

English Bazar, also called ANGREZĀBĀD, city, north-central West Bengal state, northeastern India, just west of the Mahānanda River. The city was chosen as the site of the British East India Company's silk factories (trading stations) in 1676. The Dutch and French also had settlements there. A major road and rail junction, English Bazar is an important silk and agricultural trade centre. Constituted a municipality in 1869, it has a sericultural station nearby. Pop. (2001 prelim.) city, 161,448; metropolitan area, 224,392.

English Channel, also called THE CHANNEL, French LA MANCHE, arm of the Atlantic Ocean separating the southern coast of England from the northern coast of France.

A brief treatment of the English Channel follows. For full treatment, see MACROPAEDIA: Atlantic Ocean.

The French name ("The Sleeve") is a reference to its shape, which gradually narrows from west to east from a maximum of about 112 miles (180 km) to a minimum of 21 miles (34 km) between Dover, Eng., and Calais, France. At the eastern end the Strait of Dover connects the channel with the North Sea. Occupying an area of some 29,000 square miles (75,000 square km), the channel is the smallest of the shallow seas covering the continental shelf of Europe, and its average depth generally decreases eastward from 400 to 150 feet (120 to 45 m). The English Channel's historical association as both a route for, and barrier to, invaders of Britain from the continent made it an important region of early, detailed hydrographic survey; its seabed is one of the most intensively examined seafloors in the world. The seafloor dips fairly steeply near the coast and is generally flat in the west and undulating in the east. Formed about 40 million years ago, the channel is a feature of notable scientific interest.

The traditional fishing industry of the channel declined in the 20th century with the

development of deep-sea fishing, the exhaustion of resources, and the advent of pollution problems caused, in part, by the channel's development into one of the world's busiest sea routes for oil tankers and ore carriers. Portsmouth and Plymouth are declining naval ports, and Southampton and Le Havre are losing transoceanic passengers but gaining tremendous container-ship and oil-refining capacities. Both England and France use channel waters to cool nuclear-powered generating stations. Scheduled ferries (especially hovercraft) connect many cross-channel ports.

For centuries the only passage between England and France was by boat. The often-considered idea of an English Channel tunnel at the Strait of Dover was first proposed in 1802 by a French engineer who perceived the possibilities inherent in the English Channel's chalk floor. Napoleon showed interest; but the renewal of war suspended the question, which was, nonetheless, taken up repeatedly during the 19th century. In the early 1880s private companies actually commenced digging a railroad tunnel near Folkestone, Kent, Eng., and Santerre, France. A pilot tunnel 6,000 feet (1,828 m) long was bored from the English side before a press furor over the alleged threat to Britain's security caused the government to cancel the project. (The channel ensured Britain's safety from any land invasion based on the European continent.)

In the mid-1960s the French and British governments again agreed to build a rail tunnel through the chalk layer under the channel. By the mid-1970s some 1.5 miles (2 km) of preliminary digging had been completed on each side of the channel, but the British government canceled the publicly financed project because of its high cost. The project was revived as the Channel Tunnel (*q.v.*), with construction beginning in 1987. It was privately financed (with stock sales and bank loans from several international banks) by a consortium of French and British firms. Completed in 1994, the double-rail tunnel runs between Folkestone, Eng., and Calais, France, and, with the use of high-speed trains, cuts surface travel time between Paris and London in half.

English Civil Wars (1642–51), also called GREAT REBELLION, the fighting that took place in the British Isles between Parliamentarians and supporters of the monarchy. It was precipitated by the Bishops' War (1639, 1640) with Scotland, to finance which King Charles I was forced to summon Parliament (1640) after having governed England for 11 years without it. Tension between monarch and House of Commons steadily increased; after his unsuccessful attempt to arrest five members of Parliament (Jan. 4, 1642), Charles left London (January 10), and both sides prepared for war.

Initially the opposing armies were of equal numbers (each about 13,000 men); the Royalists were superior in cavalry until the formation of Parliament's New Model Army (1645). However, Parliament's greater economic resources presaged the conflict's ultimate outcome. Whereas Royalist support came largely from Wales and from the North and West of England, Parliament held the richer South and East and controlled London, the majority of the ports, and the navy. Parliament was able to levy taxes, but for ready money the king was dependent on his supporters.

The first phase of the wars lasted from 1642 to 1646. Charles I raised his standard at Nottingham in August 1642, and a number of inconclusive encounters followed. Although unchecked at Edgehill (Oct. 23, 1642), he abandoned an advance on London when confronted by a Parliamentary force at Turnham Green; he then withdrew to Oxford, which became his military headquarters. In 1643 the Royalists at Adwalton Moor (June 30) won control of almost all Yorkshire, while Parli-

ament was victorious at Winceby (October 11) and took Lincoln; in the Southwest there were Royalist victories at Lansdown and Broadway Down (July), and Charles's nephew Prince Rupert captured Bristol. After the inconclusive first Battle of Newbury (September), both sides sought allies. Parliament in the Solemn League and Covenant bought Scottish military aid; the king made peace with the Irish (in rebellion since 1641), thereby freeing troops for deployment in Britain.

Despite the Parliamentary victory at Marston Moor (July 2), the Royalist operations of 1644 were in general the more successful. A second Battle of Newbury (September 20) settled nothing. Only in 1645, after the formation of the New Model Army and its overwhelming victory at Naseby (June 14), did the war take a decisive turn. The last Royalist army was beaten at Langport (July 10), while in Scotland the marquess of Montrose was defeated at Philiphaugh (September 13). The Scots swept through the North of England, and Parliamentary forces through the Southwest; 1646 saw the final disbandment of Royalist troops and the surrender of Oxford. King Charles took refuge with the Scots, who handed him over as a prisoner to the Parliamentarians when they left England in January 1647.

During 1647 Charles was first kidnapped by the army, which was increasingly at odds with Parliament, and then escaped, arriving by mischance in the Isle of Wight. There he negotiated with a Scottish group the secret "Engagement" (December 26), promising to establish Presbyterianism in England and suppress Independents in exchange for aid. This started the second phase of the wars, a series of Royalist rebellions, and a Scottish invasion (July 1648). All were defeated, and resentment at Charles's duplicity led to his trial and execution (January 1649).

Fighting next broke out in Ireland, where Oliver Cromwell for the newly established Commonwealth suppressed (1649–50) a major uprising of Roman Catholics and Royalists. A Scottish rebellion under Montrose was crushed (April 1650), and Charles II then made terms with the Presbyterian Covenanters. Cromwell decisively defeated them at Dunbar (Sept. 3, 1650); but, unable to follow up his victory, he then allowed Charles, recently crowned in Scotland, to march deep into England. The utter rout of the Royalists at Worcester (Sept. 3, 1651) and Charles II's subsequent flight abroad effectively ended the civil wars.

The civil wars caused comparatively little loss of life or destruction of property. Politically, their consequence was the establishment of the Commonwealth and Protectorate. In religion they fostered the English Nonconformist tradition; they also left the English with a profound distrust of standing armies.

English Classics, in horse racing, five of the oldest and most important English horse races. They are the Derby, the Oaks, the One Thousand Guineas, the Saint Leger, and the Two Thousand Guineas (*qq.v.*). For winners, owners, trainers, and jockeys, see *Sporting Record: Horse Racing*.

English East India Company: see East India Company.

English garden, French JARDIN ANGLAIS, type of garden that developed in 18th-century England, originating as a revolt against the architectural garden, which relied on rectilinear patterns, sculpture, and the unnatural shaping of trees. The revolutionary character of the English garden lay in the fact that, whereas gardens had formerly asserted man's control over nature, in the new style, man's work was regarded as most successful when it was indistinguishable from nature's. In the architectural garden the eye had been directed along artificial, linear vistas that implied man's continued control of the surrounding countryside, but in

the English garden a more natural, irregular formality was achieved in landscapes consisting of expanses of grass, clumps of trees, and irregularly shaped bodies of water.

In the 16th century the English philosopher Francis Bacon was outspokenly critical of the

English garden, Stourhead, Wiltshire, Eng.

Peter Coats

artificiality of "knot gardens." He was supported in the early 18th century by Joseph Addison and Alexander Pope, who argued that trees should be allowed to grow into natural shapes; by the artist William Hogarth, who pointed out the beauty of a wavy line; and by a new attitude that nature was good. As the factotum of the Whig aristocracy, William Kent (*q.v.*) was responsible for beginning the wholesale transformation of the old formal parterres into the new fashion. The classic example of the transformation was at Stowe in Buckinghamshire, where the greatest of England's formal gardens was by stages turned into a landscaped park under the influence of Kent and then of Lancelot Brown.

English horn, French COR ANGLAIS, German ENGLISCHHORN, orchestral woodwind instrument, a large oboe pitched a fifth below the ordinary oboe, with a bulbous bell and, at the top end, a bent metal crook on which the double reed is placed. It is pitched in F,

English horn

From *Scientific American* (October 1960)

being written a fifth higher than it sounds. Its compass is from the E below middle C to the second E above. The name first appeared in Vienna about 1760; "cor" refers to the curved or hornlike shape it then had, but the origin of "anglais" ("English") remains a mystery. The curved form, which survived locally to 1900, was nearly identical to the 18th-century *oboe da caccia* and is now sometimes used for J.S. Bach's parts for that instrument. The English horn was also built in an angular form.

The modern straight form was first exhibited in 1839 by Henri Brod of Paris. The English horn appears in many Romantic works, notably those of Hector Berlioz, César Franck, and Richard Wagner.

English language, language that originated in England and is now widely spoken on six continents. It is the primary language of the United States, the United Kingdom, Canada, Australia, Ireland, New Zealand, and various small island nations in the Caribbean Sea and the Pacific Ocean. It is also an official language of India, the Philippines, and many countries in sub-Saharan Africa, including South Africa. English is a member of the western group of the Germanic languages (itself part of the Indo-European language family) and is closely related to Frisian, German, and Netherlandic (Dutch and Flemish).

A brief treatment of the English language follows. For full treatment, see *MACROPAEDIA: Languages of the World: English language*.

In the 16th century, English was the mother tongue of only a few million people living in England, but owing to that nation's colonization of other parts of the globe and other historical factors, English was the native language of more than 350 million people by the late 20th century. It is thus the mother tongue of more people than any other language except Mandarin Chinese. English is the most widely taught foreign language and is also the most widely used second language—*i.e.*, one that two people communicate in when they cannot understand each other's native speech. It became the international language of scientific and technical discourse in the 20th century and was also widely adopted for use in business and diplomacy. In the entire world, one person in seven speaks English as either a primary or secondary language.

English is an analytic (*i.e.*, relatively uninflected) language, whereas Proto-Indo-European, the ancestral tongue of most European, Iranian, and North Indian languages, is synthetic, or inflected. (Inflections are changes in the form of words to indicate such distinctions as tense, person, number, and gender.) Over thousands of years, English has lost most of its inflections, while other European languages have retained more of theirs. Indeed, English is the only European language in which adjectives have no distinctive endings, aside from determiners and endings denoting degrees of comparison.

Another characteristic is flexibility of function. This means that one word can function as various parts of speech in different contexts. For example, the word "book" can be an adjective in "book review," a noun in "read a book," or a verb in "book a room." Because other European languages retain more inflectional endings than does English, they almost never have this characteristic. A third feature, openness of vocabulary, allows English to admit words freely from other languages and to create compounds and derivatives.

In England, British Received Pronunciation (RP) is the usual speech of educated people. In the United States, Inland Northern (popularly known as General American) is commonly used. In both countries, however, other pronunciations are acceptable.

British Received Pronunciation and American Inland Northern show several divergences: (1) After some vowels American has a semi-consonantal glide. (2) The vowel in "cod," "box," and "dock" is pronounced like "aw" in British and a sound similar to "ah" in American. (3) The vowel in "but," "cut," and "rung," is central in American but is fronted in British. (4) The vowels in the American "bath" and "bad" and in the British "bad" are all pronounced the same, but the vowel in the British "bath" is pronounced like "ah," since it is before one of the fricatives *s*, *f*, or *th* (as in "thin"). (5) When a high back vowel is preceded by *t*, *d*, or *n* in British, a glide (consonantal *y*) is inserted between them (*e.g.*, "tulip," "news"); in American the glide is omitted.

The 24 consonantal sounds comprise six stops (plosives): *p*, *b*, *t*, *d*, *k*, *g*; the fricatives *f*, *v*, *th* (as in "thin"), *th* (as in "then"), *s*, *z*, *sh* (as in "ship"), *zh* (as in "azure"), and *h*; two affricatives, *ch* (as in "church") and *j* (as in "jam"); the nasals *m*, *n*, and *ng* (as in "young"); the lateral *l*; the vibrant or retroflex *r*; and the semivowels *y* and *w*. American and British consonants have the same pronunciation with two exceptions: (1) When *r* occurs after a vowel, it is dropped in British but pronounced in American. (2) A *t* between two vowels is pronounced like *t* in "top" in British, but in American the sound is close to that of a *d*.

English is a strongly stressed language, with four degrees of stress: primary, secondary, tertiary, and weak. A change in stress can change the meaning of a sentence or a phrase. Although in comparison with other languages English stress is less predictable, there is a tendency toward antepenultimate (third syllable from the last) primary stress. This is apparent in such five-syllable words as equanimity, longitudinal, and notoriety. French stress is often sustained in borrowed words, *e.g.*, *bizárre*, *critique*, and *hotél*.

Pitch, or musical tone, may be falling, rising, or falling-rising. Word tone, which is also called pitch, can influence the meaning of a word. Sentence tone is called intonation and is especially important at the end of a sentence. There are three important end-of-sentence intonations: falling, rising, and falling-rising. The falling intonation is used in completed statements, commands, and some questions calling for "yes" or "no" answers. Rising intonation is used in statements made with some reservation, in polite requests, and in certain questions answerable by "yes" or "no." The third type of intonation, first falling and then rising pitch, is used in sentences that imply concessions or contrasts. American intonation is less singsong and stays in a narrower range than does British.

The words of the English language can be divided according to their function or form into roughly eight categories, or parts of speech: nouns, pronouns, adjectives, verbs, adverbs, prepositions, conjunctions, and interjections. Modern English nouns, pronouns, and verbs are inflected, but adjectives, adverbs, prepositions, conjunctions, and interjections are not. Most English nouns have the plural inflection (-*s*), though some remain unchanged (*e.g.*, deer). Five of the seven personal pronouns have separate forms for subject and object. English verbs are not complex. Regular or weak verbs have only four forms, strong verbs have five, and "to be" has eight. Some verbs ending in *t* or *d* have only three forms.

Besides employing inflection, English exhibits two other main morphological (structural) processes—affixation and composition—and two subsidiary ones—back-formation and blend. Affixes, word elements attached to a word, may either precede as prefixes (pre-, dis-) or follow as suffixes (-able, -er). They can be native (over-, -ness), Greek (hyper-), or Latin (-ment). English makes varied use of affixes;

often, many different ones have the same meaning, or the same one has many meanings. Suffixes are attached more closely to the stem than are prefixes and often remain permanent.

Composition, or compounding, describes putting two free forms together to form a new word. The new word can differ from the previous forms in phonology, stress, and juncture. Five types of compounds are defined by describing the relationship of the free forms to each other: (1) a compound in which the first component noun is attributive and modifies the second noun (*e.g.*, cloverleaf, beehive, vineyard); (2) one made up of a noun plus an agent noun, itself consisting of a verb-plus-agent suffix (*e.g.*, icebreaker, landowner, time-keeper); (3) a verb plus an object (*e.g.*, pastime, scarecrow, daredevil); (4) an attributive adjective plus a noun (*e.g.*, bluebell, grandson, shorthand); and (5) a noun and a present participle (*e.g.*, fact-finding, heartrending, life-giving).

Back-formation, the reverse of affixation, is the analogical formation of a new word falsely assumed to be its derivation. The verbs "to edit" and "to act" have been formed from the nouns "editor" and "actor," respectively. Blends fall into two groups: (1) coalescences, such as "bash" from "bang" and "smash," and (2) telescoped forms, called portmanteau words, such as "motorcade" from "motor cavalcade."

In English syntax, the main device for indicating the relationship between words is word order. In the sentence "The girl loves the boy," the subject is in initial position, and the object follows the verb; transposing the order of "boy" and "girl" would change the meaning. In contrast to this system, most other languages use inflections to indicate grammatical relationships. In *puerum puella amat*, which is the Latin equivalent of "The girl loves the boy," the words can be given in any order (for example, *amat puella puerum*) because the -*um* ending on the form for "boy" (*puerum*) indicates the object of the verb regardless of its position in the sentence.

English sentences generally start with the subject first, followed by the verb and then by the object. Adjectives or other single words that modify nouns are placed before the noun, while whole phrases acting as modifiers are usually placed after the noun. Adverbs are normally more mobile than adjectives, and they can occur either before or after the verb they modify. As their etymology implies, prepositions usually precede nouns, but there are a few exceptions, *e.g.*, "the whole world over." Because of the laxity of syntactic principles, English is a very easy language to speak poorly.

English has the largest vocabulary of any language in the world, chiefly because of its propensity for borrowing and because the Norman Conquest of England in the 11th century introduced vast numbers of French words into the language. The vocabulary of Modern English is thus approximately half Germanic (Old English and Scandinavian) and half Romance or Italic (French and Latin), with copious importations from Greek in science and borrowings from many other languages. Almost all basic concepts and things come from Old English, or Anglo-Saxon, as do most personal pronouns, all auxiliary verbs, most simple prepositions, all conjunctions, and almost all numbers. Many common nouns, adjectives, and verbs are of Scandinavian origin, a fact due to the Scandinavian invasions of Britain. The English language owes a great debt to French, which gave it many terms relating to dress and fashion, cuisine, politics, law, society, literature, and art. Comparison between French and English synonyms reveals the former to be more intellectual and abstract, and the latter more human and concrete. Many of the Greek compounds and derivatives in En-

glish have Latin equivalents with either similar or considerably different meanings.

The English adopted the 23-letter Latin alphabet, to which they added the letters *W*, *J*, and *V*. For the most part, English spelling is based on that of the 15th century. Pronunciation, however, has changed greatly since then. During the 17th and 18th centuries, fixed spellings were adopted, although there have been a few changes since that time. Numerous attempts have been made to reform English spelling, most of them unsuccessful.

The history of the English language begins with the migration of the Jutes, Angles, and Saxons from Germany and Denmark to Britain in the 5th and 6th centuries. Their Anglo-Saxon language is known as Old English. The formation of separate kingdoms in Britain to some extent coincided with the development of the Old English dialects of Northumbrian, Mercian, West Saxon, and Kentish. Northumbrian was in a position of cultural superiority until the destructive Viking raids of the 9th century caused cultural leadership to pass to the West Saxon kingdom of Wessex. (See Old English language.)

The Norman Conquest of 1066 set in motion the transition to Middle English. For the first century after the Conquest, a vast number of loanwords entered the English language from the dialects of northern France. The Conquest also served to place all four Old English dialects on the same cultural level and to allow them to develop independently. So West Saxon lost its supremacy, and the centre of culture gradually shifted to London. During this Middle English period the Northumbrian dialect split into Scottish and Northern, and Mercian became East and West Midland. Another outcome of the Norman Conquest was the adoption of the Carolingian script, then in use on the European continent, and changes in spelling. (See Middle English language.)

The transition from Middle to Modern English started at the beginning of the 15th century. This century witnessed three important developments: the rise of London English, the invention of printing, and the spread of new learning. The Renaissance in England produced many more scholars who were knowledgeable in foreign languages, especially Greek and Classical Latin. Their liberal attitude toward language made possible the introduction of a great number of words into English. Scholars generally date the beginning of the Modern English period at 1500. The language was subsequently standardized through the work of grammarians and the publication of dictionaries, and its vocabulary underwent another vast expansion in the 19th and 20th centuries to accommodate developments in the sciences and technology.

English lavender (aromatic plant): see lavender.

English literature, the body of written works produced in the English language by inhabitants of the British Isles from the 7th century to the present day. The major literatures written in English outside the British Isles are treated separately under American literature, Australian literature, and Canadian literature.

A brief treatment of English literature follows. For full treatment, see MACROPAEDIA: English Literature.

English literature is traditionally divided into the Old English, Middle English, Renaissance and Elizabethan, Jacobean, Restoration, 18th-century, Romantic, Victorian, and Modern periods. Literary traditions often overflow such categories, however, and diverse approaches have always coexisted. Old English and, to a lesser extent, Middle English appear to the modern reader to be foreign languages.

Old English is the first recorded English literature. The alliterative verse of Caedmon was mentioned in the Venerable Bede's *Historia ecclesiastica gentis Anglorum* ("Ecclesiastical

History of the English People") in the 8th century. Manuscripts from about AD 1000 contain the best-known Old English work, *Beowulf*, a heroic poem written about 700 to 750. Such poems were originally written to be sung, and the subject matter was generally religious or heroic. In prose there were plain-narrative historical chronicles such as *The Anglo-Saxon Chronicle*.

Middle English arguably began with the Norman Conquest of 1066. This brought both the French language, which in time combined with the Germanic Anglo-Saxon to form the basis of modern English, and a French literary influence. The Arthurian cycle became the central myth for English literature, as seen in works such as *Sir Gawayne and the Grene Knight*, an example of the alliterative revival of the 14th century, and Sir Thomas Malory's *Morte Darthur*. Geoffrey Chaucer, master of the complex narrative and sometimes presented as the first modern English writer, occupies the central position in Middle English literature. He combined the classical epic and European philosophical influence in his *Troilus and Criseyde* but also gave the vernacular a solid basis in his comic *Canterbury Tales*.

The European Renaissance had filtered into England by the 16th century and led to the questioning of the religious beliefs and assumptions of the Middle Ages. Literature began to look back beyond the medieval period to the classics for inspiration, and Neoplatonism, through Edmund Spenser and lyrical courtly poetry, became the dominant philosophical theme. Humanism emerged in Sir Philip Sidney's *Defence of Poesie* (the beginnings of English literary criticism), in Francis Bacon's prose essays, and particularly in the plays of William Shakespeare. As the central figure of the English Renaissance, Shakespeare expresses both its conflicts and its glorious energy and provides the basis for its reputation as the golden age of English literature and of English drama in particular. Shakespeare's immediate forebear, Christopher Marlowe, established the use of blank verse in plays centring on the tragic ambitions of strong personalities.

The political strife accompanying the accession of James I in 1603 produced a strain of cynicism manifested in the revenge tragedies of John Webster and the comedies of Ben Jonson and Francis Beaumont. There emerged also at this time the intellectual passion of Metaphysical poetry—with John Donne at its centre—containing the conflicts between love, religion, and the individual. Robert Herrick and other Cavalier poets, by contrast, wrote elegant and playful love lyrics. The English Civil Wars led to the closure of all English theatres in 1642 and to Oliver Cromwell's Puritan regime. The dominant literary figure was John Milton, and his influential religious epic *Paradise Lost* (1667) provided a link between the Puritan era and the restoration of the monarchy.

The return of Charles II in 1660 brought the courtly Restoration period, characterized by the witty, mannered comedies of William Congreve, the satirical poetry of Andrew Marvell, and the heroic drama and poetry of John Dryden. The diary and biography forms emerged as useful genres in the works of Samuel Pepys and Izaak Walton, and John Bunyan wrote *The Pilgrim's Progress* (1678), a popular Christian allegory.

The 18th century contained two major literary currents. The first current was the Augustan Age, or Neoclassical period, exemplified by the satires of Alexander Pope, the pamphleteering and allegory of Jonathan Swift (perhaps the greatest satirist in the language), and the criticism of Samuel Johnson. Journalism and the prose essay flourished, both influencing and being nurtured by this movement, as seen in Joseph Addison's periodical *The Spectator*.

Of great importance was the rise of the novel as an independent literary form in the works of Daniel Defoe, Samuel Richardson, Henry Fielding, and Tobias Smollett. The novelist-playwright Oliver Goldsmith, the playwright Richard Brinsley Sheridan, and Johnson's biographer, James Boswell, closed out the Augustan Age late in the century.

The second literary current to appear in the 18th century was Romanticism, which was in part a reaction against the elitism and self-imposed classical limitations of the Augustans. It began with William Blake's poetry of rebellion against convention and a new conception of the imagination as a creative force. William Wordsworth and Samuel Taylor Coleridge were central to the movement, producing a manifesto of Romantic beliefs in the preface to their joint *Lyrical Ballads* (1798). These poets concentrated on the redeeming power of nature and the destructive influence of increasing industrialization. The "second generation" of English Romanticism included John Keats, whose vivid, sensuous lyrics trace beauty and its passing; Percy Bysshe Shelley, whose works combine lyricism with political radicalism; and Lord Byron, who invented the romantic antihero in his ironic verse satires.

The 19th century was the great age of the English novel. Early in the century this form gathered strength in the fantasies of the Gothic novel and in the critical insight into polite society that was shown by Jane Austen. The historical novel was established by Sir Walter Scott in the 1820s. Charles Dickens, the greatest of all English novelists, put his comic genius at the service of exploring the ills of society and the vagaries of human nature. Following Dickens were George Eliot's portrayals of 19th-century society and its moral dilemmas, William Thackeray's ironic studies of society, and Anthony Trollope's depictions of contemporary manners and morals. Thomas Hardy marked the end of the Victorian era, and the threshold of Modernism, in his agnosticism and determinism. The two most significant figures in Victorian poetry were Robert Browning, who created psychological portraits in poems called dramatic monologues, and Alfred, Lord Tennyson, who explored the intellectual and religious problems of the time in his verse. Other notable Victorian figures were the essayist Matthew Arnold and such poets as Dante Gabriel Rossetti and Algernon Charles Swinburne. The turn of the century saw the revival of English drama by Oscar Wilde and George Bernard Shaw, together with a new profusion of novelists, among them H.G. Wells, Joseph Conrad, Arnold Bennett, John Galsworthy, E.M. Forster, and W. Somerset Maugham.

The distinctive mood of the Modern age grew from the disillusionment and cynicism that followed World War I; it appeared notably as a sense of life's bleakness in the poetry of T.S. Eliot. Writers also became increasingly self-conscious about literary form and language, as is evident in the novels of James Joyce and Virginia Woolf. Other figures, in particular the poet W.H. Auden, turned to expressing left-wing political idealism in their work. Peripheral to the Modernist movement were D.H. Lawrence, whose novels examine the complexities of sexuality and the relationships between men and women, and the Irish poet W.B. Yeats, whose work moved from Symbolism to Modernism and who was a leading figure in the Irish literary renaissance.

The novelists Evelyn Waugh, George Orwell, and Graham Greene and the Welsh poet Dylan Thomas all emerged in the 1930s but wrote some of their most important works in the years after World War II. The second half of the 20th century was characterized by a wide variety of styles and movements. An

especially vital movement was that of the Angry Young Men in the 1950s, whose members exhibited an uninhibited disdain for the traditional British establishment and class system. Drama branched out from carefully crafted and conventional plays to an emotionally raw "kitchen-sink" drama (best represented by John Osborne), the Theatre of the Absurd of Samuel Beckett, and the Theatre of Menace of Harold Pinter. Poetry showed strong regional roots as well as a deep receptivity to the way the contemporary world is underlain by strata of history. These preoccupations are imaginatively present in the work of Ted Hughes, a native of Yorkshire, and Seamus Heaney, from Northern Ireland. Fiction's many modes included the allegorical novels of William Golding, the stylized social comedies of Barbara Pym, and the satirical novels of Kingsley Amis. A major development toward the end of the century was the Postmodern novel, which made conscious use of such devices as myth, fairy tale, and fantasy. It especially served the purposes of feminist and postcolonial writers, including Angela Carter, V.S. Naipaul, and Salman Rushdie.

English oak, also called **BROWN OAK** (*Quercus robur*), ornamental and timber tree of the beech family (Fagaceae) that is native to Eurasia but also cultivated in North America and Australia. The tree has a short, stout trunk with wide-spreading branches and may grow to a height of 25 m (82.5 feet). The short-stalked leaves, 13 cm (5 inches) or more long, have three to seven pairs of rounded lobes; they are dark green above and pale green beneath and retain their colour into winter. Many varieties are cultivated as ornamentals, including a popular columnar form. The tree's

English oak (*Quercus robur*)

heavy heartwood was once extensively used in Great Britain for shipbuilding and carving.

English round hand (in calligraphy): see copperplate script.

English school, dominant school of painting in England throughout the second half of the 18th century and the first half of the 19th. Its establishment marked the rise of a national tradition that began with the emergence of native artists whose works were no longer provincial but rivaled continental art in quality and ended by exercising considerable influence on the course of European painting.

William Hogarth, a London painter and engraver, was an early representative of the English school and the first modern English master. Hogarth worked in the playful, elegant Rococo style of contemporary French art but perfected between 1730 and 1750 two new, peculiarly British forms: a type of genre painting, the "modern moral subject," which satirized contemporary life and manners with a highly narrative approach, and the small-scale group portrait, or "conversation piece."

English full-scale portraiture was revitalized by two painters, Sir Joshua Reynolds and

Thomas Gainsborough. Reynolds introduced the "Grand Manner" into English portraiture, using an extensive repertory of poses derived from Italian art in his strongly characterized portraits. His theoretical "Discourses," delivered yearly to Royal Academy students, were the single most important influence on subsequent English art. Gainsborough, who never left England and lacked Reynolds' intellectual gifts, nevertheless produced a Rococo lyricism not evident in Reynolds' work, revealing a light, fluid technique, delicate colouring, and a sensitivity to character that surpassed Reynolds' own.

Historical painting was seldom successfully attempted by English artists in the 18th century. Nevertheless, Benjamin West and John Singleton Copley, two American-born painters, gained impressive reputations in England with their innovative, if largely uninspired, depictions of current history. Genre painting flourished with such notable artists as George Morland, Joseph Wright, and the animal painter George Stubbs.

The early phase of the English school also included the beginning of the English landscape tradition, the founder of which was Richard Wilson. Applying the Classical principles of clarity and order to the depiction of the English countryside, Wilson contributed a delicate sense of light and distance and a grandeur of design to the English tradition. Though the bulk of his work was portraiture, Gainsborough was also a master of landscape and treated it with the same light touch that characterizes his portraits.

Before the turn of the 19th century, the spirit of Romanticism had begun to grow in England, and it remained dominant in English art until the mid-19th century. Among the enduring works produced are the visionary drawings of the poet William Blake and the portraits of Sir Thomas Lawrence and Sir Henry Raeburn.

The flowering of English Romantic art, however, came with the work of England's two greatest landscapists, J.M.W. Turner and John Constable. Both artists built on the tradition of Wilson and Gainsborough, as well as on the works of earlier continental painters, but they developed their mature styles with complete disregard for convention and according to their own very different personalities. Turner expressed in his highly poetic art a troubled search for peace in nature. His late work approaches abstraction—light dissolves all but the slightest indications of mass, producing pictures of almost disembodied colour. Constable limited himself almost entirely to the countryside of southern England and evolved a profoundly innovative style, characterized by a use of rough, broken touches of colour and of a fresh, bright palette free of the conventional browns within a Classical composition of receding planes. This style was especially suited to capturing the effects of light on the landscape, with which he was particularly concerned. Constable's influence on European painting was far-reaching, providing considerable inspiration to the French Impressionists.

After about 1850 the fresh observation and direct approach that had become traditional in the best English art was superseded by a self-conscious revivalism and a concern with involved theory. Though England continued to produce active movements, truly innovative development passed to other centres.

English sparrow: see house sparrow.

English sweat: see sweating sickness.

English toy spaniel, breed of dog known in Britain since Tudor times but which apparently originated in ancient Japan or China. It was favoured by Mary, Queen of Scots, King Charles II (after whom it was named the King Charles Spaniel), and Queen Victoria, as well as by members of the aristocracy. A compact

English toy spaniel, Ruby variety
Sally Anne Thompson

little dog with a domed head, short nose, and large, dark eyes, it has long, heavily haired, hanging ears and a long, soft, wavy coat. It stands 23 to 25.5 cm (9 to 10 inches) and weighs about 4 to 5.5 kg (9 to 12 pounds). There are four varieties, all similar except in colour. The King Charles variety is black and tan, as in the original members of the breed; the Prince Charles is black, tan, and white; the Blenheim is reddish brown and white; the Ruby is solid reddish brown. In Britain, all varieties except the Blenheim are grouped as King Charles spaniels.

The Cavalier King Charles spaniel is a different breed, recognized in Britain but not in the United States. It appears in the same coat colours as the English toy spaniels, but it is larger (4.5 to 8 kg [10 to 18 pounds]) and has a longer muzzle.

English yew (*Taxus baccata*), also called **COMMON YEW**, or **EUROPEAN YEW** (all three are lumber trade names), an ornamental evergreen tree of the yew family (Taxaceae), widely distributed throughout Europe and Asia as far east as the Himalayas. Some botanists consider the Himalayan form to be a separate species, called Himalayan yew. Rising to a height of from 10 to 30 m (about 35 to 100 feet), the tree has spreading branches

English yew (*Taxus baccata*)
G.E. Hyde

and slightly drooping branchlets. The bark is reddish brown and flaky, sometimes deeply fissured in very old trees. All parts of an English yew contain a substance poisonous to humans and animals. Many horticultural varieties have been developed, some of which are small shrubs. One of the most popular is the Irish yew. It has a compact, columnar form and is used in formal plantings. Several hybrids have been obtained by crossing the English yew with the Japanese yew (*q.v.*); the most common, *Taxus* × *media*, has several varieties.

engraved glass, glassware decorated with finely carved, three-dimensional patterns or pictures. The most common engraving technique involves incising a design into glass with a rapidly spinning copper wheel fed with abrasives. Other techniques include diamond scribing and stipple engraving; the former produces very delicate lines, and the latter creates shaded patterns. A design engraved in the surface of a glass article may be left rough, etched with acid, or polished. The Romans engaged in wheel engraving as early as 1 BC, producing glassware characterized by massive cut shapes. From about AD 700 to 1400 Islamic glassworkers significantly refined engraving. In addition to perpetuating the earlier modes of facet and boss cutting, they also introduced linear intaglio and relief cutting.

engraver beetle: see bark beetle.

engraving, technique of making prints from metal plates into which a design has been incised with a cutting tool called a burin. Modern examples are almost invariably made from copperplates; hence, the process is also called copperplate engraving. Another term for the process, line engraving, derives from the fact that this technique reproduces only

"Madonna and Child," engraving by Andrea Mantegna

linear marks. Tone and shading, however, can be suggested by making parallel lines or cross-hatching.

Engraving originated independently in the Rhine valley in Germany and in northern Italy about the middle of the 15th century. It seems to have been first developed by German goldsmiths now known only by their initials or pseudonyms, the most prominent being the Master E.S. and the Master of the Playing Cards. Martin Schongauer is the first engraver known to have been not only a goldsmith but also a painter. His "Temptation of St. Anthony" (c. 1470) is unprecedented in its sophisticated use of the medium to achieve a sense of form and surface texture.

In Italy, engraving grew out of both the goldsmith's art and niello work, a type of decorative metalwork. One of its earliest practitioners was the Florentine goldsmith and niellist Maso Finiguerra (1426–64). Major Italian painters adopted engraving much more enthusiastically than did their German counterparts. Before the 15th century had passed, important engravings had been made by two great Italian painters: Andrea Mantegna and Antonio Pollaiuolo. Although its quick association with painting in Italy resulted in such prodigious prints as Pollaiuolo's "Battle of the Nudes" (c. 1465), this also prevented the independent development of engraving, which soon was used primarily to reproduce paint-

ings. By the 16th century, the reproductive role of engraving had become so firmly established that Italy's greatest master of engraving technique, Marcantonio Raimondi, is mainly known for his copies of Raphael's paintings.

In northern Europe, however, engraving followed its own course, and two of its greatest 16th-century masters, Albrecht Dürer and Lucas van Leyden, produced some of their finest original work in this technique.

During the rest of the 16th century, engravers such as Hendrik Goltzius (1558–1617) continued to develop increasingly brilliant techniques. Simultaneously, however, engraving became more and more restricted to reproducing paintings. This trend, which continued throughout the 17th century, was facilitated by the popularization of techniques capable of producing gradations of tone. The dotting of the plate with short jabs of the burin, common from the late 15th century, evolved in the late 17th and 18th centuries into the techniques of stipple engraving and crayon manner (also called chalk-manner, or pastel-manner, engraving). These techniques scored the plate with numberless dots and nicks made with a burin or special tools called rockers and roulettes. With mezzotint (*q.v.*), a related technique invented in the 17th century by Ludwig von Siegen, they almost completely replaced line engraving in the 18th century. It was revived to an extent in the 20th century by the French artist Jacques Villon and the English artists Eric Gill and Stanley William Hayter. The latter demonstrated that line engraving is a suitable medium for much modern art, including abstraction. The American printmakers Mauricio Lasansky and Gabor Peterdi also produced engravings.

Engsi: see Hatchlu rug.

enhanced radiation warhead: see neutron bomb.

enharmonic, in the system of equal temperament tuning used on keyboard instruments, two tones or intervals that sound the same but are notated differently—for example, c♯ and d♭ (enharmonic tones) or c–f♯ and c–g♭ (enharmonic intervals). The different notations indicate the key to which the tone or interval belongs. Enharmonic tones and intervals often serve as pivots in modulation (change of key).

In earlier systems of tuning, such as just intonation and mean-tone tuning, the pitch of enharmonic tones was not identical; c♯ then sounded slightly lower than d♭ by about one-fifth of a tone. While the piano, harpsichord, and other fixed-pitch, equally tempered instruments cannot maintain this distinction, singers and violinists frequently do. Enharmonic in ancient Greek music referred to the tetrachord, or four-note series, containing intervals of less than a semitone.

ENI, abbreviation of ENTE NAZIONALE IDRO-CARBURI (Italian: "State Hydrocarbons Authority"), an Italian energy company operating primarily in petroleum, natural gas, and petrochemicals. By the late 1990s it was one of Europe's largest oil companies in terms of sales. Established in 1953, ENI has operations in more than 70 countries. Its headquarters are in Rome.

ENI is an outgrowth of AGIP, an oil and gas agency set up by the Italian fascist government in the 1930s. In 1952 Enrico Mattei, a former resistance fighter, persuaded the Italian postwar government to coordinate the AGIP gas and oil holdings in the new ENI; AgipPetroli is now the retail subsidiary. ENI was state-owned until 1995, when the government began to privatize the company; by the end of the 20th century, more than 60 percent of ENI was publicly owned.

ENI subsidiaries engage in exploration, production, transportation, refining, and retailing of oil and natural gas. Exploration for oil is intensive, especially in oceanic areas, and ENI

has established itself as a leader in ocean mining technology. ENI holds extensive exploration rights in northern Africa and in 2000 made an important discovery in the waters off of Angola. It also has major operations in Latin America and the North Sea. As consolidation within the oil industry increased in the late 1990s, ENI began acquiring a number of companies, including British-Borneo Oil & Gas PLC (2000) and the U.K. oil firm Lasmo PLC (2001). Among ENI's other interests are nuclear energy, chemicals, and mining and metallurgy and the manufacture of heavy machinery.

Enid, city, seat (1907) of Garfield county, north-central Oklahoma, U.S. Located at a watering place on the Chisholm (cattle) Trail (reached by the Rock Island Railroad in 1889), it was founded overnight as a tent city around a U.S. land office when the Cherokee Strip was opened by settlers on Sept. 16, 1893. Tents and shacks quickly gave way to frame houses and business establishments. The settlement was supposedly named for the character Enid in Tennyson's *Idylls of the King*. Enid subsequently became the commercial and cultural centre of northwestern Oklahoma. Wheat, cattle, and oil are its principal economic resources. Industries include flour and grain milling, meat processing, dairying, oil refining, and the manufacture of oil-field equipment. Enid is the site of Phillips University (1906), and Vance Air Force Base is nearby. Inc. 1894. Pop. (2000) city, 47,045; Enid MSA, 57,813.

Enigma, device used by the German military command to encode strategic messages before and during World War II. The Enigma code was first broken by the Poles in the early 1930s, so that German messages were eventually intercepted and deciphered by Allied code-breakers during the war. (See Ultra.)

Eniwetok (Marshall Islands): see Enewetak.

Enkhuizen, *gemeente* (commune), Nordholland *provincie*, northwestern Netherlands, on the IJsselmeer (Lake IJssel). Chartered in 1355, the town gained importance during the 16th and 17th centuries as a fishing and shipping centre for herring, although the herring-fishing industry later declined with the silting up of the Zuiderzee (late 17th century). Enkhuizen was one of the first towns in the Netherlands to revolt against the Spanish in 1572 and is today still predominantly Protestant. The Drommedaris Tower (1540) and Zuiderkerk ("South Church"), the latter containing a carillon with 48 bells, overlook the harbour. The Westerkerk ("West Church") dates from the 15th century. The Waag ("Weighhouse"; 1559), a former meeting place for surgeons, contains a 17th-century surgery, or doctor's office. The 17th-century town hall contains a self-portrait of Paulus Potter (1625–54), a renowned local painter of animals.

Industries in Enkhuizen produce electrical goods, chemicals, paper, foodstuffs, and tobacco products. Vegetables, fruit, and flowers are cultivated and dairy cattle are raised in the surrounding area and marketed in Enkhuizen. Eel fishing and the distribution of local agricultural products are economic activities connected with the harbour. A railway and roads connect Hoorn with Enkhuizen; a ferry connects it with Urk Island. A road across the IJsselmeer, between Enkhuizen and Lelystad, was completed in 1976. Pop. (1999 est.) 16,700.

Enki (Mesopotamian deity): see Ea.

enlarger, also called PROJECTION PRINTER, in photography, device for producing a photographic print or negative larger than the orig-

inal negative or transparency. The enlarger consists of a projection system, or head assembly, mounted on a horizontal base. The head assembly includes an enclosed light source, a holder for positioning and flattening the negative, a lens for projecting the image onto the base (which holds the paper), and a mechanism for focusing the image. The head assembly may be raised or lowered to adjust the size of the print.

A filter drawer between the light source and the negative permits the insertion of colour filters or variable contrast filters. Modern enlargers designed for colour printing generally incorporate adjustable filters within the head assembly itself.

Enlightenment, French *SIÈCLE DE LUMIÈRES* ("Age of the Enlightened"), German *AUFKLÄRUNG*, a European intellectual movement of the 17th and 18th centuries in which ideas concerning God, reason, nature, and man were synthesized into a worldview that gained wide assent and that instigated revolutionary developments in art, philosophy, and politics. Central to Enlightenment thought were the use and the celebration of reason, the power by which man understands the universe and improves his own condition. The goals of rational man were considered to be knowledge, freedom, and happiness.

A brief treatment of the Enlightenment follows. For full treatment, see *MACROPAEDIA: European History and Culture*.

The powers and uses of reason had first been explored by the philosophers of ancient Greece, who discerned in the ordered regularity of nature the workings of an intelligent mind. Rome adopted and preserved much of Greek culture, notably including the ideas of a rational natural order and natural law. Amid the turmoil of empire, however, a new concern arose for personal salvation, and the way was paved for the triumph of the Christian religion. Christian thinkers gradually found uses for their Greco-Roman heritage. The system of thought known as scholasticism, culminating in the work of Thomas Aquinas, resurrected reason as a tool of understanding but subordinated it to spiritual revelation and the revealed truths of Christianity.

The intellectual and political edifice of Christianity, seemingly impregnable in the European Middle Ages, fell in turn to the assaults made on it by humanism, the Renaissance, and the Protestant Reformation. Humanism bred the experimental science of Francis Bacon, Nicolaus Copernicus, and Galileo and the mathematical rigour of René Descartes, G.W. Leibniz, and Sir Isaac Newton. The Renaissance rediscovered much of classical culture and revived the notion of man as a creative being, while the Reformation, more directly but in the long run no less effectively, challenged the monolithic authority of the Roman Catholic church. For Luther as for Bacon or Descartes, the way to truth lay in the application of human reason. Received authority, whether of Ptolemy in the sciences or of the church in matters of the spirit, was to be subject to the probings of unfettered minds.

The successful application of reason to any question depended on its correct application—on the development of a methodology of reasoning that would serve as its own guarantee of validity. Such a methodology was most spectacularly achieved in the sciences and mathematics, where the logics of induction and deduction made possible the creation of a sweeping new cosmology. The success of Newton, in particular, in capturing in a few mathematical equations the laws that govern the motions of the planets gave great impetus to a growing faith in man's capacity to attain knowledge. At the same time, the idea of the

universe as a mechanism governed by a few simple (and discoverable) laws had a subversive effect on the concepts of a personal God and individual salvation that were central to Christianity.

Inevitably, the method of reason was applied to religion itself. The product of a search for a natural—rational—religion was deism, which, although never an organized cult or movement, conflicted with Christianity for two centuries, especially in England and France. For the deist a very few religious truths sufficed, and they were truths felt to be manifest to all rational beings: the existence of one God, often conceived of as architect or mechanic, the existence of a system of rewards and punishments administered by that God, and the obligation of men to virtue and piety. Beyond the natural religion of the deists lay the more radical products of the application of reason to religion: skepticism, atheism, and materialism.

The Enlightenment produced the first modern secularized theories of psychology and ethics. John Locke conceived of the human mind as being at birth a *tabula rasa*, a blank slate on which experience wrote freely and boldly, creating the individual character according to the individual experience of the world. Supposed innate qualities, such as goodness or original sin, had no reality. In a darker vein, Thomas Hobbes portrayed man as moved solely by considerations of his own pleasure and pain. The notion of man as neither good nor bad but interested principally in survival and the maximization of his own pleasure led to radical political theories. Where the state had once been viewed as an earthly approximation of an eternal order, with the city of man modeled on the city of God, now it came to be seen as a mutually beneficial arrangement among men aimed at protecting the natural rights and self-interest of each.

The idea of society as a social contract, however, contrasted sharply with the realities of actual societies. Thus the Enlightenment became critical, reforming, and eventually revolutionary. Locke and Jeremy Bentham in England, Jean-Jacques Rousseau, Montesquieu, and Voltaire in France, and Thomas Jefferson in America all contributed to an evolving critique of the arbitrary, authoritarian state and to sketching the outline of a higher form of social organization, based on natural rights and functioning as a political democracy. Such powerful ideas found expression as reform in England and as revolution in France and America.

The Enlightenment expired as the victim of its own excesses. The more rarefied the religion of the deists became, the less it offered those who sought solace or salvation. The celebration of abstract reason provoked contrary spirits to begin exploring the world of sensation and emotion in the cultural movement known as Romanticism. The Reign of Terror that followed the French Revolution severely tested the belief that man could govern himself. The high optimism that marked much of Enlightenment thought, however, survived as one of the movement's most enduring legacies: the belief that human history is a record of general progress.

Enlil (Mesopotamian deity): see *Bel*.

Enmebaragesi, also spelled *ENMEBARAGISI*, also called *ME-BARAGESI* (fl. c. 2700 BC), king of Kish, in northern Babylonia, and the first historical personality of Mesopotamia.

Enmebaragesi is known from inscriptions about him on fragments of vases of his own time, as well as from later traditions. He was the next-to-last ruler of the first dynasty of Kish. He "despoiled the weapons of the land of Elam," one inscription asserts. His son, Agga, was the last king of the dynasty, owing to his defeat by Gilgamesh, according to the Sumerian epic *Gilgamesh and Agga of Kish*.

Enmerkar, ancient Sumerian hero and king of Erech, a city-state in southern Mesopotamia, who is thought to have lived at the end of the 4th or beginning of the 3rd millennium BC. Along with Lugalbanda and Gilgamesh, Enmerkar is one of the three most significant figures in the surviving Sumerian epics.

Although scholars once assumed that there was only one epic relating Enmerkar's subjugation of a rival city, Aratta, it is now believed that two separate epics tell this tale. One is called *Enmerkar and the Lord of Aratta*. The longest Sumerian epic yet discovered, it is the source of important information about the history and culture of the Sumero-Iranian border area. According to this legend, Enmerkar, son of the sun god Utu, was envious of Aratta's wealth of metal and stones, which he needed in order to build various shrines, especially a temple for the god Enki in Eridu. Enmerkar therefore requested his sister, the goddess Inanna, to aid him in acquiring material and manpower from Aratta; she agreed and advised him to send a threatening message to the lord of Aratta. The lord of Aratta, however, demanded that Enmerkar first deliver large amounts of grain to him. Though Enmerkar complied, the lord of Aratta refused to complete his part of the agreement; threatening messages were again sent out by both men, each claiming the aid and sanction of the goddess Inanna. The text becomes fragmented at that point in the narrative, but in the end Enmerkar was apparently victorious.

The other epic relating the defeat of Aratta is known as *Enmerkar and Ensuhkeshdanna*. In this tale the ruler of Aratta, Ensuhkeshdanna (or *Ensusukshiranna*), demanded that Enmerkar become his vassal. Enmerkar refused and, declaring himself the favourite of the gods, commanded Ensuhkeshdanna to submit to him. Although the members of Ensuhkeshdanna's council advised him to comply with Enmerkar, he listened instead to a local priest, who promised to make Erech subject to Aratta. When the priest arrived in Erech, however, he was outwitted and killed by a wise old woman, Sagburru, and the two sons of the goddess Nidaba. After he learned the fate of his priest, Ensuhkeshdanna's will was broken and he yielded to Enmerkar's demands.

A third epic, *Lugalbanda and Enmerkar*, tells of the heroic journey to Aratta made by Lugalbanda in the service of Enmerkar. According to the epic, Erech was under attack by Semitic nomads. In order to save his domain, Enmerkar required the aid of Inanna, who was in Aratta. Enmerkar requested volunteers to go to Inanna, but only Lugalbanda would agree to undertake the dangerous mission. The epic concerns the events of Lugalbanda's journey and the message given him from Inanna for Enmerkar. Although obscure, Inanna's reply seems to indicate that Enmerkar was to make special water vessels and was also to catch strange fish from a certain river.

Enna, Latin *ENNA*, or *HENNA*, city, capital of Enna *provincia*, central Sicily, Italy, on a plateau dominating the valley of the Dittaino, northeast of Caltanissetta. A city of the Siculi, an ancient Sicilian tribe, and a centre of the pre-Hellenic cult of Demeter and Kore (Persephone), it originated as Henna and early came under Greek influence, first from Gela (7th century BC) and later from Syracuse, after which it fell into the hands of the Syracusan tyrant Dionysius I in about 397 BC. After a brief period (4th century) of Carthaginian rule, it passed to the Romans in 258 BC. It was the headquarters (134–132 BC) of the great Sicilian slave revolt. It was of little note in later classical times, but its natural strength and strategic position gave it renewed importance in the Middle Ages. Held by the Saracens from 859 until 1087, it was then taken by the Normans. Its medieval name *Castrogio-*

vanni, derived from the Arabic Kasr-Yani, is a corruption of the Latin *Castrum Henna*, a favourite residence of the emperor Frederick II of Hohenstaufen and of Frederick II and III of Aragon, it was among the first Sicilian cities to rally to the Italian cause in 1848 and 1860. In 1927 it resumed its ancient name.

Notable buildings include an octagonal tower of Emperor Frederick II, the cathedral (1307; rebuilt in Baroque style), and the Castello di Lombardia, the work of many periods. The Lago (lake) di Pergusa, 4 mi (6 km) south, is the traditional scene of the seizure of Proserpina (Proserpina) by Hades (Pluto), king of the underworld.

An episcopal see, the city is a summer resort and agricultural centre. Sulfur is mined in the vicinity. Pop. (1991) mun., 28,300.

Ennedi, plateau region, northeastern Chad, central Africa, centred around the town of Fada. The terrain is primarily arid desert, with sandstone peaks rising to 4,756 ft (1,450 m). Wild game is abundant. The region has a sparse population of semi-nomads, chiefly Muslims who speak the Dazaga dialect. They live in permanent villages during the rainy months of July, August, and September but disperse for the dry season. Their herds include camels, horses, donkeys, sheep, and goats. Dates, wheat, millet, and barley grow in the oases. Because the area was considered ungovernable, following Chad's independence in 1960 it remained under French military administration until 1965, when the French withdrew at Chad's request.

Ennin, original name MIBU, also called JIKAKU DAISHI (b. 794, Tsuga District, Shimotsuke Province, Japan—d. Feb. 24, 864, Japan), Buddhist priest of the early Heian period, founder of the Sammon branch of the Tendai sect, who brought from China a system of vocal-music notation still used in Japan.

At the age of 8 Ennin began his education at Dai-ji (*ji*, "temple"), and he entered the Tendai monastery of Enryaku-ji on Mt. Hiei near Kyoto when he was 15. He became a disciple of the priest Saichō, founder of the sect and the temple. Efforts were under way to harmonize Buddhism and Shinto, and the emperor Nimmyō named Ennin to a large study mission to T'ang China, where Saichō's inspiration for Tendai had originated.

Ennin spent nine years there, observing, studying, reading, and writing, and when he returned home in 847 he brought with him 559 volumes of Chinese Buddhist literature and many religious implements for Buddhist rituals. Tendai Buddhism had a strong tradition of music, and to the temple at Enryaku-ji, Ennin also brought the method of musical notation for chants used in China, a system of curved and shaped lines and figures called neumes, whose use continues in Japan. Among his voluminous writings was a detailed journal of his Chinese travels.

It was also Ennin who introduced to Japanese Buddhism *nembutsu*, the practice of chanting the name of Amida Buddha, and this contributed to a new piety developing in rural Japan. The Imperial Court recognized Ennin's contributions by naming him *daihossshi* ("great priest") in 848. Ennin's doctrines and teachings, stressing piety and the possibility of becoming a Buddha in this life, developed into the Sammon branch of Tendai Buddhism, one of the three branches of the sect that continue to exist, and influenced the course of Japanese Buddhism for centuries to come. He became chief priest of his order in 854. Upon his death in 864 the title *hōin daichi* (the highest priestly rank, in effect, "high priest of supreme wisdom") was posthumously conferred on him, and two years later he was given the honorific name Jikaku Daishi.

Ennis, Irish INIS (River-Meadow), county town (seat) of County Clare, Ireland, on the

River Fergus. Incorporated in 1612, it is now controlled by an urban district council. A Franciscan abbey, founded about 1242, is a national monument. Ennis, on the main Limerick-Galway road, is the principal rail and road junction of County Clare and has flour mills and textile, imitation jewelry, electronics, and engineering industries. Pop. (2001 est.) 18,400.

Enniskillen, also spelled INNISKILLING, Irish INIS CEITHLEANN, town and seat, Fermanagh district (established 1973), formerly in County Fermanagh, Northern Ireland. Situated on Cethlin's Island, it was a strategic crossing point of Lough Erne and an ancient stronghold of the Maguires of Fermanagh. Incorporated by the English king James I, it defeated a force sent by James II in 1689 and gained a reputation as a Protestant stronghold. Long a garrison town, it gave its name to the Royal Inniskilling Fusiliers and the 6th (Inniskilling) Dragoons, both famous regiments of the British Army. Enniskillen functions as an agricultural market; other activities include bacon curing and hosiery manufacture. On nearby Devenish Island are the ruins of St. Mary's Abbey, a 6th-century foundation of St. Molaise. Oscar Wilde, late 19th-century poet and dramatist, was a student at the Royal School, founded in 1618. Pop. (1991) 11,436.

Ennius, Quintus (b. 239 BC, Rudiae, southern Italy—d. 169 BC), epic poet, dramatist, and satirist, the most influential of the early Latin poets, rightly called the founder of Roman literature. His epic *Annales*, a narrative poem telling the story of Rome from the wanderings of Aeneas to the poet's own day, was the national epic until it was eclipsed by Virgil's *Aeneid*.

Because of the place of his birth, Ennius was at home in three languages and had, as he put it, "three hearts": Oscan, his native tongue; Greek, in which he was educated; and Latin, the language of the army with which he served in the Second Punic War. The elder Cato took him to Rome (204), where he earned a meagre living as a teacher and by adapting Greek plays, but he was on familiar terms with many of the leading men in Rome, among them the elder Scipio. His patron was Marcus Fulvius Nobilior, whose son Quintus obtained Roman citizenship for Ennius. Nothing else of significance is known about his life.

Only some 600 lines of the *Annales* survive. As an epic, it lacks unity and suffers from mixing mythological elements with eyewitness accounts of contemporary history.

Ennius excelled in tragedy. Titles survive of 19 plays adapted from the Greek, mostly Euripides; e.g., *Iphigenia at Aulis*, *Medea*, *Telephus*, and *Thyestes*. About 420 lines remain, indicating remarkable freedom from the originals, great skill in adapting the native Latin metres to the Greek framework, heightening the rhetorical element and the pathetic appeal (a feature of Euripides that he greatly admired) through skillful use of alliteration and assonance. His plays on Roman themes were *Sabinae* and, if they really were plays, *Ambrachia* (on the capture of that city by Fulvius) and *Scipio*.

In the *Saturae* Ennius developed the only literary genre that Rome could call its own. Four books in a variety of metres on diverse subjects, they were mostly concerned with practical wisdom, often driving home a lesson with the help of a fable. More philosophical were two works on the theories of Epicurus, the Sicilian poet and philosopher. Some epigrams, on himself and Scipio Africanus, are the first Latin elegiac couplets.

Ennius, who is credited also with the introduction of the double spelling of long consonants and the invention of Latin shorthand, was a man of wide interests and was conversant with the intellectual and literary movements of the Hellenistic world. He created

and did not fall far short of perfecting a mode of poetic expression that reached its greatest beauty in Virgil and was to remain preeminent in Latin literature.

Cicero and others admired the work of Ennius throughout the republican period. Critical remarks appeared in Horace, becoming more severe in Seneca and Martial.

Ennodius, Magnus Felix (b. 473/4, Arelate, Gaul—d. 521, Ticinum, Pavia), Latin poet, prose writer, rhetorician, and bishop, some of whose prose works are valuable sources for historians of his period.

A member of the important and influential family of the Anicii, Ennodius lived in Ticinum and Mediolanum (Milan), an important centre of learning. Though his interests were largely secular and literary, in 493 he was ordained deacon to the Bishop of Ticinum, and in 507 he was appointed by the Pope to compose a panegyric on Theodoric, expressing gratitude for the Arian king's tolerance of Catholicism. After a sudden illness he renounced secular pursuits in fulfillment of a vow. After appointment to the see of Ticinum in about 513, Ennodius was sent by Theodoric on an embassy to the court of the emperor Anastasius I at Constantinople. Ennodius has been represented as a friend of Theodoric, but his support of him may have been a consequence of the friendship between Theodoric and Epiphanius, the former bishop of Ticinum.

Ennodius' literary output is considerable and varied. He composed occasional poems, including two itineraries of his journeys, two poems on works of art, another on a garden, some epigrams, and other miscellaneous poems of lesser merit. His prose works include a biography of Epiphanius, which throws a valuable light on the political activity of the church and is, together with a panegyric on Theodoric, an important source for the historian; *Dictiones*, a collection of model speeches which reveal the continuance of the traditional rhetorical education and give a valuable description of the school of the grammarian Deuterius in Milan; epistles on a wide range of subjects (including some addressed to Boethius, to whom he was related); and the *Eucharisticum de vita sua*, a kind of confession. He also wrote, in a mixture of prose and verse, the *Paraenesis didascalica*, otherwise entitled *Ennodius Ambrosio et Beato*, a didactic treatise on grammar and rhetoric.

Much of Ennodius' writing shows his devotion to pagan Roman tradition, which was zealously fostered by the Anician family; like other members of his family, he sought to reconcile this tradition with Christianity. The rhetorical basis of his training and interest is reflected throughout his works, the chief concern of which is form, but his style is affected, excessive, overelaborate, and diffuse.

*A list of the abbreviations used
in the MICROPAEDIA will be found
at the end of this volume*

Enns, town, *Bundesland* Oberösterreich (federal province of Upper Austria), northeast central Austria, on the Enns River near its junction with the Danube, southeast of Linz. Its suburb of Lorch (incorporated into Enns in 1938) is on the site of the Roman camp of Lauriacum. Enns itself was established as a fortress in the 9th century and was chartered in 1212, making it the oldest chartered municipality in Austria. Notable landmarks include the parish church (1308-43), one of the finest early Gothic buildings in Austria; the Stadtturm, or Town Tower (1554-68); the castle of Ennsegg (1565; on older foundations); and the

old town hall (1547), now housing a local museum with Roman relics. The Baroque Abbey of St. Florian is to the west of the town. Enns

Stadtturm, or Town Tower, Enns, Austria
F. Wolfsberger—ZEFA

manufactures glassware, jewelry, and roofing and has breweries. Pop. (2001) 10,611.

Enoch, First Book of, also called **ETHIOPIAN BOOK OF ENOCH**, pseudepigraphal work (not included in any canon of scripture) whose only complete extant version is an Ethiopic translation of a previous Greek translation made in Palestine from the original Hebrew or Aramaic.

Enoch, the seventh patriarch in the book of Genesis, was the subject of abundant apocryphal literature, especially during the Hellenistic period of Judaism (3rd century BC to 3rd century AD). At first revered only for his piety, he was later believed to be the recipient of secret knowledge from God. This portrait of Enoch was influenced by the Babylonian tradition of the 7th antediluvian king, Enmen-duranna, who was linked to the sun god and received divine revelations. The story of Enoch reflects features of the Babylonian myth.

I Enoch is a compilation of several separate works, most of which are apocalyptic. Its oldest portion is the "Apocalypse of Weeks," written shortly before the Maccabean uprising of 168 BC against the Romans. Other sections, especially those dealing with astronomical and cosmological speculations, are difficult to date. Because of its views on messianism, celibacy, and the fate of the soul after death, parts of *I Enoch* may have originated with or been influenced by the Essene community of Jews at Qumrān. No fragments of the longest portion of the work (chapters 37–71), however, were found among the Qumrān writings. This has led scholars to theorize that this section was perhaps written in the 2nd century AD by a Jewish Christian who wished to imbue his own eschatological speculations with the authority of Enoch, and added his work to four older apocryphal Enoch writings.

I Enoch was at first accepted in the Christian Church but later excluded from the biblical canon. Its survival is due to the fascination of marginal and heretical Christian groups, such as the Manichaeans, with its syncretic blending of Iranian, Greek, Chaldean, and Egyptian elements.

Enoch, Second Book of, also called **SLAVONIC BOOK OF ENOCH**, pseudepigraphal work whose only extant version is a Slavonic

translation of the Greek original. The Slavonic edition is a Christian work, probably of the 7th century AD, but it rests upon an older Jewish work written sometime in the 1st century AD (but before the destruction of the Temple of Jerusalem in AD 70, because there are references to pilgrimages and cultic rituals connected with temple worship). In its apocalyptic and cosmological emphases, the book is similar to *First Book of Enoch* and may be dependent on it, although *II Enoch* is recognized as a separate part of the literary tradition surrounding the patriarch Enoch.

The first part of the book (chapters 1–21) deals with Enoch's journey through the seven tiers of heaven; it thus invites comparisons with descriptions of the heavenly spheres and their inhabitants in the *I Enoch* and the "Testament of Levi" in *Testaments of the Twelve Patriarchs*. The second section (chapters 22–38) is an explication of the tradition of Enoch's reception of secret wisdom from God. The final section (chapters 39–68) includes Enoch's advice to his sons and an account of his life, including his final ascension.

A product of the Greek-speaking Jewish Diaspora centred in Alexandria, Egypt, *II Enoch* includes many of the motifs characteristic of Hellenistic religious literature: visionary journeys, astrological calculations, a highly developed angelology, personal confrontations with divine beings, and a structural view of heaven.

Enomoto Takeaki, also called **ENOMOTO BUYO** (b. Oct. 5, 1836, Edo, Japan—d. Oct. 26, 1908, Tokyo), Japanese naval officer and statesman who was the last supporter of the Tokugawa family—which ruled Japan for 264 years—to capitulate to the forces that favoured the restoration of power to the emperor.

In 1868, as the fighting to end the long domination of the nation by the Tokugawa family neared a close, Enomoto took eight ships of the Tokugawa navy to Hokkaido, the northernmost Japanese island, with the intention of making it an independent republic. He surrendered to imperial forces in 1869, after which he spent three years under house arrest. Restored to favour, Enomoto later held many important ministerial positions with the government of the Meiji emperor. As envoy extraordinary to Russia (1873–76), he concluded the Treaty of St. Petersburg, by which Japan gave up its claim to Sakhalin Island in exchange for the northern Kurils. He next served as navy minister (1876–82) and was minister to China (1882–84). He subsequently held the portfolios of communications, education, foreign affairs, agriculture, and commerce. He was created viscount in 1887.

Enotah, Mount (Georgia, U.S.): see Brass-town Bald.

Enquist, Per-Olov (b. Sept. 23, 1934, Hjøgg-böle, Swed.), Swedish writer and social critic of the 1960s.

Enquist's first novels, *Kristallögat* (1961; "The Crystal Eye") and *Färdvägen* (1963; "The Route Travelled"), reflect his aesthetic interest in the form of the novel and the influence of the French new novel. As the political climate of the 1960s changed, Enquist moved from a liberal viewpoint to a socialist position. He began to take a documentary approach in both his novels and dramas. This technique, with its quasi-scholarly method, first became noticeable in *Hess* (1966) and was carried out with great effectiveness in *Legionärerna* (1968; *The Legionnaires*, 1973), a study of the extradition of Baltic refugees from Sweden at the end of World War II. A year later the book was awarded the Nordic Prize. His novel *Musikanternas utåg* (1978; "The Departure of the Musicians") deals with early unionizing efforts in his native province. His most successful drama, *Tribadernas natt* (1975; *The Night of the Tribades*, 1977), analyzes August Strindberg's marital relationship.

Later works include the novels *Kapten Nemos bibliotek* (1991; *Captain Nemo's Library*, 1992) and *Livläkarens besök* (1999; *The Royal Physician's Visit*, 2001).

Enragé (French: Madman), any of a group of extreme revolutionaries in France in 1793, led by a former priest, Jacques Roux, and Varlet, a postal official, who advocated social and economic measures favoured by the lower classes. The Enragés' name reflects the horror that they aroused in the bourgeoisie. Concerned primarily with the problem of a critical food shortage, the Enragés supported price controls over commodities, requisitioning of grain, and government assistance to the poor. In the spring of 1793, they took an active part in the popular agitation that led to the overthrow of the moderate Girondins in the National Convention and pressured the Montagnards, or the Jacobins in the convention, into taking emergency and terroristic measures to protect the Revolution. The leaders of the Enragés, fierce critics of the government, charged it with inaction and were arrested in September 1793 by order of the ruling Committee of Public Safety. The Enragés were replaced as popular leaders of the Revolution by the group known as the Hébertists.

Enrico (Italian personal name): see under Henry.

Enright, D(ennis) J(oseph) (b. March 11, 1920, Leamington, Warwickshire, Eng.—d. Dec. 31, 2002, London), British poet, novelist, and teacher.

After receiving a master's degree at Cambridge, he began a prolonged period of academic wandering with a lectureship in English at the University of Alexandria, Egypt (1947–50), followed by posts at the University of Birmingham (1950–53); Kōnan University, Japan (1953–56); Free University of Berlin (1956–57); Chulalongkorn University of Bangkok (1957–59); the University of Singapore (1960–70); and honorary professor at the University of Warwick (1975–80). He was joint editor of *Encounter* in London (1970–72). *Memoirs of a Mendicant Professor* (1969) tells of his years abroad.

Both his poetry (*Selected Poems*, 1969) and his novels (*Academic Year*, 1955; *Figures of Speech*, 1965) are anti-sentimental and reflect his life abroad. Later poetry is based on literary works or themes, as *Paradise Illustrated* (1975) and *A Faust Book* (1979). He also wrote fiction for children, such as *Joke Shop* (1976) and *Wild Ghost Chase* (1978). He edited *The Oxford Book of Contemporary Verse 1948–1980* (1980).

Enrique (Spanish personal name): see under Henry.

Enschede, gemeente (municipality), **Overijssel provincie** (province), eastern Netherlands, on the Twente Canal, near the German border, comprising the villages of Lonneker, Glanerbrug, and Boekelo and the town of Enschede. Chartered in 1325, it was a small village until the industrial development of the Twente district in the late 19th century. Now the largest town in Overijssel, it is the centre of the Dutch cotton-textile industry and is a rail junction with a canal harbour. Metallurgy and the manufacture of rubber goods and tires are also important. Destroyed by fire in 1862 and badly damaged in World War II, Enschede has been rebuilt in modern style. Twente military airport, 3.5 mi (5.6 km) to the north, is also used for domestic commercial transport. The town's principal features are the town hall (1933), the municipal theatre (1955), the Twente National Museum, the natural history museum and vivarium, the Roman Catholic and Dutch Reformed churches, and the modern synagogue. There is a technical school for textiles, as well as a technical university (1961), and Enschede is the triennial meeting

place of De Kogge, an association of Dutch, Flemish, and German writers. Boekelo is a summer resort. Enschede metropolitan area is contiguous with Hengelo (*q.v.*). Pop. (1999 est.) 148,814.

Ensenada, city, northwestern Baja California Norte state, northwestern Mexico. It is on Bahía (bay) Todos Santos of the Pacific Ocean, 43 ft (13 m) above sea level. The climate is cool and dry. Ensenada, the third largest city in Baja California Norte, derives much of its income from tourism, for it is only about 75 mi (120 km) south of Tijuana, on the United States border. Attractions include excellent seafood, swimming, hunting, and deep-sea fishing.

It is one of Mexico's most important Pacific ports. Agriculture (wheat, barley, and wine grapes), livestock raising, and fishing (sardines and lobster) are also important. The city has experienced substantial growth since 1950. It is accessible by highway and air as well as by ocean. Pop. (1995) 192,550.

Ensenada, Zenón de Somodevilla y Bengoechea, marqués de la (marquess of) (b. June 2, 1702, Alesanco, near Logroño, Spain—d. Dec. 2, 1781, Medina del Campo), Spanish statesman who as prime minister from 1743 to 1745 pursued a vigorous reform policy that succeeded in advancing internal prosperity and promoting military strength.

Ensenada owed his early advancement to the chief minister of King Philip V (reigned 1700–46), José Patiño, who put him in charge of work at the new naval arsenal at El Ferrol del Caudillo. Ensenada accompanied the successful expedition against Oran in 1732. Four years later he organized the expedition to Naples that put Philip's son Carlos on the Neapolitan throne and was rewarded with the title of marqués. He also carried out various diplomatic missions in Italy and helped negotiate an alliance with France (the Second Family Compact) in 1743. Ensenada was appointed prime minister that year.

An able and effective administrator, Ensenada encouraged the development of agriculture and industry, undertook public works, sought to reform tax collection methods, fostered education, and removed abuses in the customs system to help facilitate internal commerce. He also stimulated the development of the army and especially the navy, building up both the Atlantic and Mediterranean fleets.

In foreign affairs Ensenada took a generally pro-French yet independent stance but regarded England with some hostility. This attitude aroused resentment in the court and helped contribute to intrigues by the British ambassador that brought about Ensenada's downfall (1754) and his banishment to Granada. Ensenada was received at court after the accession of Charles III in 1759 and served as a member of a commission on taxation reform. Because of his pro-Jesuit views, he was once more banished in 1766 and thereafter took no further part in public life.

ensign wasp, any member of the insect family Evaniidae (order Hymenoptera), so called

because the small, oval abdomen is held high like an ensign, or flag. A few hundred species of this widely distributed family have been described.

The body, which is black and somewhat spider-like in appearance, ranges in length from about 1 to 1.5 centimetres (about 0.4 to 0.6 inch). All species are parasites of cockroaches, which are common household pests; thus, ensign wasps are beneficial to man. The female places its eggs in the cockroach's egg case. *Evania appendigaster* is a common North American species.

ensilage (agriculture): *see* silage.

Ensor, James (Sydney), BARON (b. April 13, 1860, Ostend, Belg.—d. Nov. 19, 1949, Ostend), Belgian painter and printmaker

"Portrait of the Artist Surrounded by Masks," oil painting by James Ensor, 1899; private collection

whose works are known for their bizarre fantasy and sardonic social commentary.

Ensor was an acknowledged master by the time he was 20 years old. After a youthful infatuation with the art of Rembrandt and Rubens, he adopted the vivacious brushstroke of the French Impressionists.

When Ensor's works were rejected by the Brussels Salon in 1883, he joined a group of progressive artists called *Les Vingt* (*q.v.*; *The Twenty*). During this period, in such works as his "Scandalized Masks" (1883; Musée Royal des Beaux-Arts de Belgique, Brussels), he began to depict images of grotesque fantasy—skeletons, phantoms, and hideous masks.

Ensor's interest in masks probably began in his mother's curio shop. His "Entry of Christ into Brussels" (1888; Musée Royal des Beaux-Arts, Antwerp), filled with carnival masks painted in smeared, garish colours, provoked such indignation that he was expelled from *Les Vingt*.

Ensor, nevertheless, continued to paint such nightmarish visions as "Masks (Intrigues)" (1890) and "Skeletons Fighting for the Body of a Hanged Man" (1891; both in the Musée Royal des Beaux-Arts, Antwerp). As criticism of his work became more abusive, the artist became more cynical and misanthropic, a state of mind given frightening expression in his "Portrait of the Artist Surrounded by Masks." He finally became a recluse and was seen in public so seldom that he was rumoured to be dead.

After 1900 Ensor's art underwent little change. When, in 1929, his "Entry of Christ into Brussels" was first exhibited publicly,

King Albert of Belgium conferred a barony on him.

enstatite, common silicate mineral in the pyroxene family. It is the stable form of magnesium silicate ($MgSiO_3$, often with up to 10 percent iron) at low temperatures. *See* orthopyroxene.

The other forms of magnesium silicate are protoenstatite, which occurs at very high temperatures, and clinoenstatite, which occurs in unstable form at low temperatures. Enstatite and protoenstatite crystallize in the orthorhombic system (three unequal axes at right angles to each other); clinoenstatite crystallizes in the monoclinic (three unequal axes with one oblique intersection). Clinoenstatite forms a series with clinoferrisilite that is analogous to the enstatite-ferrosilite series.

Enshkeshdanna, also spelled **ENKUKH-SIRANNA**, legendary ruler of the ancient Sumerian city-state of Aratta and rival of the king of Erech, Enmerkar (*q.v.*).

entablature, in architecture, assemblage of horizontal moldings and bands supported by and located immediately above the columns of Classical buildings or similar structural supports in non-Classical buildings.

The entablature is usually divided into three main sections: the lowest band, or architrave, which originally took the form of a simple beam running from support to support; the central band, or frieze, consisting of an unrolled strip with or without ornament; the top band, or cornice, constructed from a se-

ries of moldings that project from the edge of the frieze.

The germinal styles of the entablature correspond to and are one of the distinguishing features of three of the main orders of architecture: Doric, Ionic, and Corinthian. Most entablatures not associated with these three orders are derived from them. *See also* order.

entail, also called **FEE TAIL**, in feudal English law, an interest in land bound up inalienably in the grantee and then forever to his direct descendants. A basic condition of entail was that if the grantee died without direct descendants the land reverted to the grantor. The concept, feudal in origin, supported a landed aristocracy because it served to prevent the disintegration of large estates through divisible inheritance or the lack of heirs. Statutory reforms in England now permit the owner to convey the entailed land by a simple deed and even by will.

There were entailed estates in the American colonies, principally in the Middle and Southern colonies, but almost all the states emulated Thomas Jefferson's statute of 1776 for Virginia and abolished entails.

Entamoeba, protozoan genus of the rhizopodan order Amoebida. Most species are parasitic in the intestines of many vertebrates, including humans; *E. histolytica* is the cause of human amebic dysentery. The cell nucleus,

Entamoeba coli
A.L. Leu

which is distinctive for the genus, contains a central body, the endosome, and a ring of uniformly sized granules attached to the nuclear membrane.

Primary infection of the large intestine with *E. histolytica* (amebiasis) is often asymptomatic; however, diarrhea, abdominal pain, and fever may result from invasion and ulceration of intestinal walls. Secondary infection occurs in the liver, lungs, brain, and spleen after the amoebas enter the circulation by way of the portal vein and produce abscesses in these tissues. Encysted *E. histolytica* are transmitted through food and water, often by fly and cockroach droppings. Excystment (emergence from the cyst) occurs in the vertebrate intestine. The species sometimes is separated by size into the larger, pathogenic form and the smaller, nonpathogenic form, *E. hartmanni*.

Another species, *E. gingivalis*, is found around the gum margins, especially in unhealthy or pyorrhoeic mouths. It has not, however, been shown to cause disease.

Entartete Kunst: *see* Degenerate Art.

entasis, in architecture, the convex curve given to a column, spire, or similar upright member, to avoid the optical illusion of hollowness or weakness that would arise from normal tapering. Entasis is almost universal in Classic columns. Exaggerated in Greek archaic Doric work, it grew more and more subtle in the 5th and 4th centuries BC. (Entasis is also occasionally found in Gothic spires and in the smaller Romanesque columns.)

Entasis of a Doric column (the dash lines indicate how a column would look if tapered without entasis)

From M.S. Briggs, *Everyman's Concise Encyclopaedia of Architecture*, J.M. Dent & Sons and E.P. Dutton and Company, Inc.

In the many attempts that have been made to find a mathematical basis for the entasis, it has been reduced to all kinds of elliptical hyperbolic, parabolic, and even cycloidal curves. The immense variety of forms indicates, however, that the curve was probably laid out freehand and purely empirically.

Ente Nazionale Idrocarburi: *see* ENI.

Entebbe, city, south-central Uganda, eastern Africa, at the end of a peninsula jutting into Lake Victoria 21 miles (34 km) south of Kampala. Founded as a garrison post in 1893, it served as the British administrative centre of Uganda until 1958. Its elevation (3,760 feet [1,146 m] above sea level) gives it a perpetually moderate summer climate. Entebbe has noted botanical gardens, a veterinary research laboratory, and a virus research institute. Basically a residential centre for government employees, the city has no industry. It is, however, a transportation crossroads for eastern Africa, with an international airport and steamship connections via Lake Victoria to the countries of Kenya and Tanzania and to other parts of Uganda. The airport was the site of an Israeli airborne commando raid on the night of July 3/4, 1976, that freed 103 hostages from a jet

Botanical gardens in Entebbe, Uganda
Agence Hoa Qui

hijacked by Palestinian terrorists. The population is African, with small minorities of Europeans. The Asian minority was expelled in 1972. Pop. (2001 est.) 52,500.

Entebbe raid (July 3–4, 1976), rescue by an Israeli commando squad of 103 hostages from a French jet airliner en route from Israel to France that, after stopping at Athens, had been hijacked on June 27 by Palestinian terrorists and flown to Entebbe, Uganda. At Entebbe, the hijackers freed those of the 258 passengers who did not appear to be Israeli and held the rest hostage for the release of 53 fellow terrorists imprisoned in Israel, Kenya, West

Germany, and elsewhere. In response, Israel, on July 3, dispatched four Hercules C-130H cargo planes carrying 100–200 soldiers and escorted by Phantom jet fighters. After flying 2,500 miles from Israel to Uganda, the Israeli force rescued the hostages within an hour after landing. Seven of the terrorists were killed, and 11 MiG fighters supplied to Uganda by the Soviet Union were destroyed; the Israelis lost one soldier and three hostages during the operation. On the return trip the Israeli planes met an awaiting hospital plane and refueled at Nairobi, Kenya. The success of the Entebbe raid substantially boosted Israeli morale.

entelechy (from Greek *entelecheia*), in philosophy, that which realizes or makes actual what is otherwise merely potential. The concept is intimately connected with Aristotle's distinction between matter and form, or the potential and the actual. He analyzed each thing into the stuff or elements of which it is composed and the form which makes it what it is (*see* hylomorphism). The mere stuff or matter is not yet the real thing; it needs a certain form or essence or function to complete it. Matter and form, however, are never separated; they can only be distinguished. Thus, in the case of a living organism, for example, the sheer matter of the organism (viewed only as a synthesis of inorganic substances) can be distinguished from a certain form or function or inner activity, without which it would not be a living organism at all; and this "soul" or "vital function" is what Aristotle in his *De anima* (*On the Soul*) called the entelechy (or first entelechy) of the living organism. Similarly, rational activity is what makes a man to be a man and distinguishes him from a brute animal.

Gottfried Wilhelm Leibniz, a 17th-century German philosopher and mathematician, called his monads (the ultimate reality of material beings) entelechies in virtue of their inner self-determined activity. The term was revived around the turn of the 20th century by Hans Driesch, a German biologist and philosopher, in connection with his vitalistic biology to denote an internal perfecting principle which, he supposed, exists in all living organisms.

Entente Cordiale (April 8, 1904), Anglo-French agreement that, by settling a number of controversial matters, ended antagonisms between Great Britain and France and paved the way for their diplomatic cooperation against German pressures in the decade preceding World War I (1914–18). The agreement in no sense created an alliance and did not entangle Great Britain with a French commitment to Russia (1894).

The Entente Cordiale was the culmination of the policy of Théophile Delcassé, France's foreign minister from 1898, who believed that a Franco-British understanding would give France some security against any German system of alliances in western Europe. Credit for the success of the negotiation belongs chiefly to Paul Cambon, France's ambassador in London, and to the British foreign secretary Lord Lansdowne; but the pro-French inclination of the British sovereign, Edward VII, was a contributory factor.

The most important feature of the agreement was that it granted freedom of action to Great Britain in Egypt and to France in Morocco (with the proviso that France's eventual dispositions for Morocco include reasonable allowance for Spain's interests there). At the same time, Great Britain ceded the Los Islands (off French Guinea) to France, defined the frontier of Nigeria in France's favour, and agreed to French control of the upper Gambia valley, while France renounced its exclusive right to certain fisheries off Newfoundland. Furthermore, French and British zones of influence in Siam (Thailand) were outlined, with the eastern territories, adjacent to French

Indochina, becoming a French zone, and the western, adjacent to Burmese Tenasserim, a British zone; arrangements were also made to allay the rivalry between British and French colonists in the New Hebrides.

By the Entente Cordiale both powers reduced the virtual isolation into which they had withdrawn—France involuntarily, Great Britain complacently—while they had eyed each other over African affairs: Great Britain had had no ally but Japan (1902), useless if war should break out in European waters; France had had none but Russia, soon to be discredited in the Russo-Japanese War of 1904–05. The agreement was consequently upsetting to Germany, whose policy had long been to rely on Franco-British antagonism. A German attempt to check the French in Morocco in 1905 (the Tangier Incident, or First Moroccan Crisis), and thus upset the Entente, served only to strengthen it. Military discussions between the French and the British general staffs were soon initiated. Franco-British solidarity was confirmed at the Algeiras Conference (1906) and reconfirmed in the Second Moroccan Crisis (1911).

enteritis, inflammation of the intestines (especially of the small intestine), caused by irritants, poisons, disease organisms, or unknown factors. Regional enteritis (ileitis, or Crohn's disease) is a chronic inflammation that, in its classic form, is confined to the terminal portion of the ileum, the portion of the small intestine farthest from the stomach. The symptoms are extremely variable but usually include continuous or intermittent diarrhea, sometimes bloody, accompanied by painful abdominal cramps. Fever is common and sometimes overshadows the digestive symptoms; grave complications may occur, especially in infants and the elderly. Enterocolitis involves the colon as well as the small intestine, and gastroenteritis includes stomach inflammation. In all forms of enteritis, treatment is usually directed toward relief of symptoms, with anti-inflammatory agents playing an important role.

enterocoelomate, any animal in which the body cavity (coelom) arises in the embryonic stage as an outpocketing of the developing gut (enteron). This form of development, found in echinoderms (e.g., starfishes, sea urchins) and a few other invertebrate phyla and in chordates (e.g., fishes, amphibians, reptiles, birds, mammals), has been viewed as evidence of the common ancestry of echinoderms and chordates.

enterogastrone, a hormone secreted by the duodenal mucosa when fatty food is in the stomach or small intestine; it is also thought to be released when sugars and proteins are in the intestine. Enterogastrone is transported by the bloodstream to the glands and muscles of the stomach, where it inhibits gastric movements and secretions, possibly by blocking the production or activity of gastrin, the hormone that initially causes these functions. Enterogastrone may slow down stomach emptying by reducing the amount of acid produced. High acid content causes the valve between the stomach and intestine to relax, allowing food passage.

The chemical identity of enterogastrone is still uncertain. Substances from the intestine that were thought to be enterogastrone have been shown to be composed of not one but possibly as many as three independent hormones. Two of these hormones are now known as secretin and cholecystokinin. Consequently, many functions originally thought to be performed by enterogastrone have been reassigned to these other hormones.

enterokinase, also called ENTEROPEPTIDASE, proteolytic enzyme (*q.v.*), secreted from the duodenal mucosa, that changes the inactive pancreatic secretion trypsinogen into trypsin,

one of the enzymes that digest proteins. Enterokinase is believed to be produced by the glands of Brunner in the membrane lining of the duodenum. It resists destruction from the various enzymes in the small intestine but is destroyed by bacteria in the large intestine. Enterokinase can also change inactive procarboxypeptidase into the active enzyme carboxypeptidase.

enteropneust: see acornworm.

enterprise unionism, the organization of a single trade union within one plant or multi-plant enterprise rather than within a craft or industry. It is especially prevalent in Japan, where nearly all Japanese unions, representing the vast majority of union membership, are of the enterprise type.

A Japanese enterprise union contains both regularly employed white- and blue-collar workers and low-level managers. Most enterprise unions in the same industry affiliate into an industry-wide federation, and, in turn, nearly all of these federations are members of Rengō (Japanese Trade Union Confederation). An individual enterprise union, however, normally bargains without the direct participation of industrial federation or Rengō representatives. Instead, these latter groups coordinate enterprise-level bargaining, especially for the annual "spring offensive" (*shuntō*). Strikes, however, do not last long. Frequently, as in the "spring offensive," strikes are scheduled in advance as a series of short work stoppages.

To some degree, Japanese enterprise unionism reflects Japan's traditional low turnover of labour; workers usually remain with one employer for all or most of their working lives and tend to identify with the company rather than the union. In addition, some unions seem to be unduly—even at times illegally—influenced by management because of the close identification of union with enterprise. Thus, opinion is divided on whether this practice, compared to other forms of unionism, effectively advances member interests.

enthalpy, the sum of the internal energy and the product of the pressure and volume of a thermodynamic system. Enthalpy is an energy-like property or state function—it has the dimensions of energy, and its value is determined entirely by the temperature, pressure, and composition of the system and not by its history. In symbols, the enthalpy, H , equals the sum of the internal energy, E , and the product of the pressure, P , and volume, V , of the system: $H = E + PV$.

According to the law of energy conservation, the change in internal energy is equal to the heat transferred to, less the work done by, the system. If the only work done is a change of volume at constant pressure, the enthalpy change is exactly equal to the heat transferred to the system. As with other energy functions, it is neither convenient nor necessary to determine absolute values of enthalpy. For each substance, the zero-enthalpy state can be some convenient reference state.

enthymeme, in syllogistic, or traditional, logic, name of a syllogistic argument that is incompletely stated. In the argument "All insects have six legs; therefore, all wasps have six legs," the minor premise, "All wasps are insects," is suppressed. Any one of the propositions may be omitted—even the conclusion; but in general it is the one that comes most naturally to the mind. Often in rhetorical language the deliberate omission of one of the propositions has a dramatic effect. This use of the word differs from Aristotle's original application of it (in his *Prior Analytics*, ii, 27) to a rhetorical syllogism (employed for persuasion instead of instruction) based on "probabilities or signs"; i.e. on propositions that are generally valid or on particular facts that may be held to justify a general principle or another particular fact.

entisol, soil type distinguished from the nine other orders of soil taxonomy by the absence or rudimentary development of soil horizons. Such soils are formed under a wide variety of climatic and surface conditions. Entisol soils tend to be of recent origin, such as those forming over young geologic formations (fresh lava, land exposed by uplift or landslip, or stabilized sand dunes). They also include soils degraded by erosion or altered plant cover, soils forming over rock that resists weathering or is chemically toxic to plants, and youthful alluvial soils deposited by rivers and streams. Entisols are most common in mountainous and desert regions.

entodiniomorph, any ciliated protozoan of the order Entodiniomorpha. They are harmless parasites in the rumen and intestines of cattle, horses, and other herbivores. Entodiniomorphs are common and extremely numerous: one cow may harbour 10 billion or more. The cells are irregularly shaped, and extensive syncilia (specialized ciliary tufts) spiral into the anterior, elevated mouth. Several projections are found at the posterior of the cell; the largest is believed to serve as a rudder. It is possible that entodiniomorphs maintain a commensal or symbiotic relationship with their host by aiding digestion; for example, certain species digest cellulose. Entodiniomorphs reproduce asexually by binary fission and also exhibit the sexual phenomenon of conjugation. Represent-

Entodiniomorph (*Cycloposthium bipalmatum*)
J.M. Langham

tative genera include *Cycloposthium*, which is found in horses, and *Diplodinium*, which inhabits ruminants, such as cattle, antelopes, and dromedary camels.

entomology, branch of zoology dealing with the scientific study of insects. The Greek word *entomon*, meaning "notched," refers to the segmented body plan of the insect. The zoological categories of taxonomy, morphology, physiology, and ecology are included in this field of study. Also included are the applied aspects of economic entomology, which encompasses the harmful and beneficial impact of insects on humans and their activities.

Throughout history the study of insects has intrigued great scientific minds. In the 4th century BC, the Greek philosopher and scientist Aristotle provided descriptions of insect anatomy, establishing the groundwork for modern entomology. Pliny the Elder added to Aristotle's list of species. The Italian naturalist Ulisse Aldrovandi published a major treatise, *De Animalibus Insectis*... ("Of Insect Animals") in 1602. With the aid of the newly developed microscope, the Dutch naturalist Jan Swammerdam (*q.v.*) was able to observe the minute structures of many insect species. Modern insect classification began in the 18th century. The French biologist René-Antoine Ferchault de Réaumur published the first of six volumes of *Mémoires pour servir à l'histoire des insectes* ("Memoirs Serving as a His-

tory of Insects") in 1734. Carolus Linnaeus, in *Systema Naturae* (10th ed., 1758), applied his system of binomial nomenclature to organize the classification of insect species. Entomology emerged as a distinct field of study in the early 19th century, with the publication of such works as the 8-volume *British Entomology* (1824–39), by John Curtis, and the founding of entomological societies in Paris and London.

The body of knowledge gleaned from the study of insects has enabled modern economic entomologists to develop methods for controlling insect pests. Some insects are perceived as threats to humans, both as agents of crop destruction and as disseminators of disease. Methods of integrating pest management—which combine chemical, biological, cultural, and sanitation strategies—have been devised to control the damage done by insects to agricultural products. Data collected by entomologists has benefited not only pest-management practices; genetics research using the vinegar fly (*Drosophila melanogaster*) has been extremely fruitful. Insects also have been used in biochemical, developmental, and behavioral studies. The many functions that insects perform in the ecosystem—such as the pest control that dragonflies and mantises provide as predators of other insects or the decomposition of organic matter that scavenger insects accelerate—also have been elucidated by entomological study.

entoproct, any member of the phylum Entoprocta, a group of aquatic invertebrate animals, composed of more than 100 species. Entoprocts occur throughout the world, primarily in marine habitats, although one genus, *Urnatella*, is a freshwater form. Entoprocts may either exist singly or form colonies of communicating members, called zooids, by budding. The zooids measure only about 0.4 to 5 mm (0.016 to 0.2 inch) in height. Each of them has a stalk (peduncle), which may be jointed, that attaches to shells, seaweed, or to other animals, such as sponges, bryozoans, hydroids, and segmented worms, that produce water currents.

The body of an entoproct consists of a globular head (calyx) that houses a U-shaped gut and the nervous, excretory, and reproductive systems. A crown of ciliated tentacles creates a water current that draws food particles toward a central mouth. The calyx often is discarded and then regenerated in colonial species. The solitary species develop daughter buds, which detach themselves when mature. Entoprocts also have free-swimming larvae that settle and develop into new colonies or individuals. Although the larva and the pattern of its early development indicate that the entoprocts may be linked remotely with the annelids and their related phyla, there is no evidence of a close link with any phylum.

First described in 1774, entoprocts were classified with the moss animals (bryozoans), in which filter-feeding, tentaculated zooids also are present. The similarities between the two groups, however, are superficial. Their methods of food capture, for example, differ fundamentally; in addition, bryozoan zooids are coelomate, and the anus opens outside the tentacles. The name Entoprocta was introduced in 1869, and the group was first recognized as a phylum in 1888. Alternative names (Calyssozoa and Kamptozoa) were proposed in 1921 and 1929.

The phylum Entoprocta is small and has no known fossil members. The subdivision of the phylum into three families does not accord fully with the considerable differences between colonial and noncolonial forms. It might be more accurate if two orders were recognized; the first order would include the families Pedit-

Structure of entoprocts

(A) *Loxosoma singulare* zooid with two buds, (B) *Urnatella gracilis* colony consisting of a flexible stalk with urnlike segments, and (C) *Pedicellina cernua* calyx (top view)

cellinidae (about 30 species classified into six genera according to stalk structure) and Urnatellidae (2 species), and the second order would contain only the Loxosomatidae (about 100 species).

entotrochian: see dipluran.

entrapment, in law, instigation or inducement of a person into the commission of a crime by an officer of the law.

Entrapment does not include situations in which the officer has not instigated the offense but merely provided the opportunity or occasion for its commission. Thus, the use of deceptions, tricks, decoys, informers, and undercover operators, in order to convict a criminal offender, does not in itself constitute entrapment.

The doctrine has received its most frequent application in cases of liquor violations and narcotics and gambling offenses. The courts have taken the view that offenders who have been led into criminal acts by law-enforcement personnel are not guilty.

Entre Ríos, *provincia*, eastern Argentina. It is located between two rivers, the Paraná (west) and the Uruguay (east), the latter of which forms the Uruguayan border; the province's name means "between rivers." Entre Ríos is the southern part of the region sometimes called the Argentine Mesopotamia. It occupies an undulating plain that is interrupted in the north and along its eastern and western margins by forested, hilly ridges. The province tapers in the south into the Paraná deltaic lands of the northwestern Río de la Plata estuary. El Palmar National Park, near the city of Concepción del Uruguay, includes a palm forest, parts of which are 800 years old, and archaeological remains.

There were some late 16th-century colonial settlements, but the region did not receive provincial status until 1814. During the dictatorship of Juan Manuel de Rosas (1829–52), Entre Ríos became a centre of opposition based upon antagonism to his control of river trade. General Justo José de Urquiza, one of

the opposition leaders, contrived Rosas' overthrow and, as head of the new Argentine Confederation, made Paraná the national capital. The downfall of Urquiza in 1861 led to the reinstatement of Buenos Aires as the capital. In the second half of the 19th century, Entre Ríos was settled by large numbers of Italian, German, and Swiss immigrants, which led to its rapid agricultural development and economic expansion. The earliest meat-packing and preserving plants in Argentina were established there.

Agricultural activities (cattle raising, wheat, flax, rice, and citrus fruits) are of great economic significance in the province. Food-processing and consumer-goods industries are numerous, particularly in Paraná (*q.v.*), the provincial capital. Gualaguay, on the Gualaguay River in southern Entre Ríos, is the hub of a cattle-ranching area and has port facilities for river traffic. The first direct transportation links between the Argentine Mesopotamia and Buenos Aires were achieved in the late 1970s when a system of bridges, roadways, and railways 20 miles (33 km) long was completed across the Paraná River delta. Area 30,418 square miles (78,781 square km). Pop. (1991 prelim.) 1,022,865.

entrechat (probably from Italian *intrecciare*: "to weave," or "to braid"), jump in ballet, beginning in the fifth position, during which the dancer crosses his straight legs at the lower calf. Numerous rapid crossings make the entrechat a spectacular jump. Numbers (*trois*, "three"; *quatre*, "four"; and so on) are affixed to the term to designate the amount of leg movement (*entrechat-quatre* has two crossings; *entrechat-dix* has five). The dancer

Entrechat executed by Rudolf Nureyev; solo variation from "Flower Festival at Genzano" Fred Fehl

lands on both feet for even-numbered and on one foot for odd-numbered entrechats. Vaslav Nijinsky's famous jumps reputedly included the *entrechat-dix*, and an *entrechat-douze* (six crossings) was performed more recently on English television as danced by Wayne Sleep.

entropion, turning in of the border of the lower eyelid, a condition sometimes occurring in elderly persons. It is caused by (1) spasms of the orbicularis oculi, a muscle that extends along the lid margin and functions during winking, and (2) relaxation of the orbital septa, membranes of the eye socket that support the lids. The turning in of the lid margin allows the eyelashes to rub against the cornea, with resultant irritation. Ulceration of the cornea may be a complication. The treatment is surgical correction of the abnormality. Entropion may also occur as a complication of other eye diseases. *Compare* ectropion.

entropy, the measure of a system's energy that is unavailable for work. Since work is obtained from order, the amount of entropy is also a measure of the disorder, or randomness, of a system.

A brief treatment of entropy follows. For full treatment, see MACROPAEDIA: Thermodynamics, Principles of.

If energy in the form of heat dQ is added to a system held at a constant temperature T , the change in entropy dS is given by

$$dS = (dU + pdV)/T \geq dQ/T,$$

where dU is the change in energy, p is the pressure, and dV is the change in volume. For reversible processes, $dS = dQ/T$ and S is a state variable since its value is completely determined by the current state of the system—i.e., independent of what path was followed to reach the current state. All natural processes are irreversible and involve an increase in entropy, $dS > dQ/T$. Entropy is an extensive property; that is, its magnitude varies from zero to the total amount of energy within a system.

The concept of entropy was proposed in 1850 by the German physicist Rudolf Clausius and is sometimes presented as the second law of thermodynamics (see thermodynamics). According to this law, entropy increases during an irreversible process such as the spontaneous mixing of hot and cold gases, the uncontrolled expansion of a gas into a vacuum, and the combustion of a fuel.

In one statistical interpretation of entropy, it is found that for a very large system in a thermodynamic equilibrium state, entropy S is proportional to the natural logarithm of a quantity W representing the maximum number of microscopic ways in which the macroscopic state corresponding to S can be realized; that is, $S = k \ln W$, in which k is the Boltzmann constant.

All spontaneous processes are irreversible; hence, it has been said that the entropy of the universe is increasing: that is, more and more energy becomes unavailable for conversion into mechanical work, and because of this the universe is said to be "running down."

Enugu, state, south-central Nigeria. It was created in 1991 from the eastern two-thirds of Anambra state. Enugu is bounded by the states of Kogi and Benue to the north, Cross River to the east, Abia to the south, and Anambra to the west. It includes most of the Udi-Nsukka Plateau, which rises to more than 1,000 feet (300 m). Enugu state is covered by open grassland, with occasional woodlands and clusters of oil palm trees. The Igbo (Ibo) constitute the majority of the state's population.

Agriculture plays an important role in the state's economy; yams, oil palm products, taro, corn (maize), rice, and cassava are the main crops. Enugu, the state capital, is a major centre for coal mining. Iron ore also is mined, and deposits of limestone, fine clay, marble, and silica sand are worked. Industries include textile manufacturing, food processing, lumbering, soft-drink bottling, brewing, and furniture manufacturing. A network of roads connects Enugu town with Awgu, Ezangbo, and Nsukka. Enugu also is linked by the eastern branch of the Nigerian Railways with Port Harcourt, and it has an airport. The University of Nigeria was founded at Nsukka in 1960. Pop. (1991) 3,161,295.

Enugu, town, capital of Enugu state, south-central Nigeria, at the foot of the Udi Plateau. It is on the railroad from Port Harcourt, 150 miles (240 km) south-southwest, and at the intersection of roads from Aba, Onitsha, and Abakaliki. The town owes its existence to the discovery of coal on the plateau in 1909, which led to the building of Port Harcourt. With the completion of the railway from the port

in 1916, Enugu developed rapidly. Its name, enu Ugwu, meaning "at the top of the hill," comes from the traditional Igbo (Ibo) village of Enugu Ngwo on the plateau. The headquarters (1939–51) of the Eastern provinces and the regional capital (1951–67) of Eastern Nigeria, it served briefly (May–October 1967) as the provisional capital of the secessionist Republic of Biafra until its capture by federal troops.

Coal mining is still important, but Enugu's economy became more diversified in the 1960s. Near the town's airport, 7 miles (11 km) east, is the industrial estate of Emene, where steel rods, asbestos cement products, and oxygen and acetylene gases are manufactured. Enugu also has a railway workshop, an automobile assembly plant, furniture and pottery factories, a sawmill, and smaller textile and foodstuff enterprises. A cement plant at Nkalagu, 33 miles (53 km) east, uses Enugu coal and supplies Emene's cement plant. Enugu is also a trade centre for the yams, cassava, taro, corn (maize), pigeon peas, rice, onions, and cattle raised by the Igbo people of the surrounding area and is a railway collecting point for timber from Obubra and cashew nuts from nearby Oghé.

Enugu is an educational as well as a governmental and industrial centre. It is the site of the University of Nigeria (1960). It is likewise the site of the Enugu State University of Science and Technology (1980) and the Institute of Management and Technology. The state library and a radio station are also located there. Pop. (1993 est.) 293,000.

enuresis, elimination disorder characterized by four factors: the repeated voluntary or involuntary voiding of urine during the day or night into bedding or clothing; two or more occurrences per month for a child between the ages of five and six (one or more for older children); chronological age of at least five, mental age of at least four; and the absence of a causative physical disorder. Enuresis may additionally be classified as primary (when urinary continence has never been achieved), secondary (when continence was achieved for at least one year and then lost), nocturnal (occurring only during sleep), or diurnal (occurring during waking hours). The most prevalent form is nocturnal enuresis (also called bed-wetting and usually of the primary type), and the disorder occurs more often among boys than girls.

A number of genetic, social, physical, and psychological factors may play a role in the disorder. Considerable evidence indicates that enuretic individuals often are members of families in which parents or siblings also have been enuretic. Stressful life events, poor toilet training, and chronic social disadvantage are among the social factors that have been found to increase the prevalence of enuresis. No specific physical factor has been pinpointed, but slight delay in maturation and limited functional bladder capacity have been noted in some enuretic children. While some enuretic children have emotional or behavioral disorders, no causal relationship can be established with certainty. Treatment includes education and reassurance of parents and child, behavioral-conditional therapy, and the use of an alarm to awaken the child when urination is begun. The latter treatment has proved highly effective. Treatment by drugs is usually a last resort; the drug imipramine has had some success, but no single method of treatment has been entirely successful.

Enver Paşa (b. Nov. 22, 1881, Constantinople [now Istanbul], Turkey—d. Aug. 4, 1922, near Balıkhuan, Turkistan [now in Tajikistan]), Ottoman general and commander in chief, a hero of the Young Turk Revolution of 1908, and a leading member of the Ottoman government from 1913 to 1918. He played a key role in the Ottoman entry into World

War I on the side of Germany, and, after the Ottoman defeat in 1918, he attempted to organize the Turkic peoples of Central Asia against the Soviets.

An organizer of the Young Turk Revolution, Enver joined General Mahmud Şevket, under whose command an "Army of Deliverance" advanced to Constantinople to depose the Ottoman sultan Abdülhamid II. In 1911, when warfare broke out between Italy and the Ottoman Empire, he organized the Ottoman resistance in Libya, and in 1912 he was appointed the governor of Banghâzî (Benghazi; now in modern Libya).

Back in Constantinople, he participated in the politics of the Committee of Union and Progress, leading the coup d'état of Jan. 23, 1913, which restored his party to power. In the Second Balkan War (1913), Enver was chief of the general staff of the Ottoman army.

Enver Paşa, detail of an oil painting by A. Fischer, 1917; in the Topkapı Sarayı Museum, Istanbul

By courtesy of the Topkapı Sarayı Museum, Istanbul

On July 22, 1913, he recaptured Edirne (Adrianople) from the Bulgars; and until 1918, the empire was dominated by the triumvirate of Enver, Talât Paşa, and Cemal Paşa.

In 1914 Enver, as minister of war, was instrumental in the signing of a defensive alliance with Germany against Russia. When the Ottoman Empire entered World War I on the side of the Central Powers (November 1914), Enver cooperated closely with German officers serving in the Ottoman army. His military plans included Pan-Turkic (or Pan-Turanian) schemes for uniting the Turkic peoples of Russian Central Asia with the Ottoman Turks.

These plans resulted in the disastrous defeat in December 1914 at Sarıkamış, where he lost most of the 3rd Army. He recovered his prestige, however, when the Allied forces withdrew from the Dardanelles (1915–16). In 1918, following the Russian Revolution of 1917 and Russia's withdrawal from the war, he occupied Baku (now in Azerbaijan). After the Armistice in Europe, Enver fled to Germany (November 1918).

In Berlin he met the Bolshevik leader Karl Radek, and in 1920 he went to Moscow. He proposed the idea of overthrowing the regime of Mustafa Kemal (Atatürk) in Turkey with Soviet aid, but this plan received no support from Moscow. Though the Russian leaders became suspicious of him, Enver was nevertheless allowed to go to Turkistan with a plan for helping to organize the Central Asian republics. In 1921, however, the revolt of the Basmachi in Bukhara against the Soviet regime flared up, and Enver joined the insurgents. He was killed in action against the Red Army.

Envigado, city, Antioquia *departamento*, northwestern Colombia. It is situated near the Porce River, between the Occidental and Central ranges of the Andes Mountains, at an elevation of 5,085 feet (1,550 m) above sea level. Formerly a commercial and manufacturing centre for a fertile agricultural and pastoral area, Envigado is now part of the industrial complex centring on the department capital of Medellín, 6 miles (10 km) north by highway. Its principal industry is textile manufacturing. Pop. (1995 est.) 109,240.

environment, the complex of physical, chemical, and biotic factors that act upon an organism or an ecological community and ultimately determine its form and survival.

The Earth's environment is treated in a number of articles in the *MACROPAEDIA*. The major components of the physical environment are discussed in the articles Atmosphere, Climate and Weather, Continental Landforms, Hydrosphere, and Oceans. The principal biological systems and components of the environment, and the major ecosystems of the Earth, are treated in the article Biosphere. The significant environmental changes that have occurred during Earth's history are surveyed in the article Geochronology. The pollution of the environment and the conservation of its natural resources are treated in the article Conservation of Natural Resources. The modern environmental movement and the body of domestic and international law created to address environmental problems are discussed in the article Environmentalism and Environmental Law. Hazards to life in the biosphere are discussed in the articles Death, Disease, and Immunity.

environmental biology: see ecology.

environmental engineering, the development of processes and infrastructure for the supply of water, the disposal of waste, and the control of pollution of all kinds. These endeavours protect public health by preventing disease transmission, and they preserve the quality of the environment by averting the contamination and degradation of air, water, and land resources.

Environmental engineering is a broad field that draws on such disciplines as chemistry, ecology, geology, hydraulics, hydrology, microbiology, economics, and mathematics. It was traditionally a specialized field within civil engineering and was called sanitary engineering until the mid-1960s, when the more accurate name environmental engineering was adopted.

Projects in environmental engineering involve the treatment and distribution of drinking water; the collection, treatment, and disposal of wastewater; the control of air and noise pollution; the management of municipal solid waste and of hazardous waste; the cleanup of hazardous-waste sites; and the preparation of environmental assessments, audits, and impact studies. Mathematical modeling and computer analysis are widely used to evaluate and design the systems required for such tasks. Chemical and mechanical engineers may also be involved in the process. Environmental engineers' functions include applied research and teaching; project planning and management; the design, construction, and operation of facilities; the sale and marketing of environmental control equipment; and the enforcement of environmental standards and regulations.

The education of environmental engineers usually involves graduate-level course work, though some colleges and universities allow undergraduates to specialize or take elective courses in the environmental field. Programs offering associate (two-year) degrees are also

available for training environmental technicians. In the public sector, environmental engineers are employed by national and regional environmental agencies, local health departments, and municipal engineering and public works departments. In the private sector, they are employed by consulting engineering firms, construction contractors, water and sewerage utility companies, and manufacturing industries. (J.A.N.)

environmental geology, field concerned with applying the findings of geologic research to the problems of land use and civil engineering. It is closely allied with urban geology and deals with the impact of human activities on the physical environment (*e.g.*, contamination of water resources by sewage and toxic chemical wastes). Other important concerns of environmental geology include reclaiming mined lands; identifying geologically stable sites for constructing buildings, nuclear power plants, and other facilities; and locating sources of building materials, such as sand and gravel.

environmental sculpture, 20th-century art form intended to involve or encompass the spectators rather than merely to face them; it developed as part of a larger artistic current that sought to break down the historical dichotomy between life and art. The environmental sculptor can utilize virtually any medium, from mud and stone to light and sound.

The works of the American sculptor George Segal (*q.v.*) are among the best-known self-contained sculptural environments; his characteristic white plaster figures situated in mundane, authentically detailed settings evoke feelings of hermetic alienation and suspension in time. By contrast, the eerily realistic figures of Duane Hanson, an American influenced by Segal, are usually displayed in such a way as to partake of, contribute to, and indeed often disturb the given exhibition environment. Other notable sculptors of indoor environmental works include the American artist Edward Kienholz, whose densely detailed, emotionally charged works often incorporate elements of the surreal, and Lucas Samaras and Robert Irwin, also Americans, both of whom have employed transparent and reflective materials to create complex and challenging optical effects in gallery and museum spaces.

The larger context of the natural and urban outdoors has preoccupied another group of environmental artists. The controversial "earthworks" of Robert Smithson and others frequently have entailed large-scale alterations of the Earth's surface; in one notable example, Smithson used earth-moving equipment to extend a rock and dirt spiral, 1,500 feet (460 m) long, into Great Salt Lake in Utah ("Spiral Jetty"; 1970). The Bulgarian-born artist Christo (*q.v.*) has involved large numbers of people in the planning and construction of such mammoth *alfresco* art projects as "Valley Curtain" (1972; Rifle Gap, Colo.). Christo's numerous "wrapped buildings" have been notable among urban environmental works of the past few decades.

environmentalism, in politics and philosophy, the movement that seeks to improve and protect the quality of the natural environment through changes to environmentally harmful activities by humans and the adoption of environmentally benign forms of political, economic, and social organization. For full treatment, see *MACROPAEDIA*: Environmentalism and Environmental Law.

environmentalism, in the social sciences, any theory that emphasizes the importance of environmental factors in the development of culture and society.

The theory of environmental determinism states that the physical milieu of a people, including natural resources, climate, and geogra-

phy, is the major determining factor in the formation of their culture. Determinism thereby rejects history and tradition, social and economic factors, and other aspects of culture as explanations of social development. Environmental possibilism, an opposing doctrine, suggests that habitat acts only to create possibilities from which people may choose.

Contemporary environmentalists recognize that physical surroundings are only part of a total environment that includes social and economic factors, cultural tradition, and reciprocal influences between societies and their environment.

Enzinas, Francisco de (b. 1520, Burgos, Spain—d. Dec. 30, 1552?, Strassburg [now Strasbourg, France]), Spanish scholar and humanist, one of the most important figures of the abortive Spanish Reformation.

While studying at Wittenberg University, Enzinas became a friend and protégé of the Lutheran reformer Philipp Melancthon. Enzinas' Spanish translation of the New Testament, which was published in Antwerp in 1543, was proscribed by the Spanish Inquisition. Enzinas' published works, which often appeared under the pseudonyms of Francisco de Chesne and Dryander, included a history of religion in Spain and translations of Livy and Plutarch.

enzyme, a substance that acts as a catalyst in living organisms, regulating the rate at which chemical reactions proceed without itself being altered in the process.

A brief treatment of enzymes follows. For full treatment, see *MACROPAEDIA*: Biochemical Components of Organisms.

The biological processes that occur within all living organisms are chemical reactions, and most are regulated by enzymes. Without enzymes, many of these reactions would not take place at a perceptible rate. Enzymes catalyze all aspects of cell metabolism. This includes the digestion of food, in which large nutrient molecules (such as proteins, carbohydrates, and fats) are broken down into smaller molecules; the conservation and transformation of chemical energy; and the construction of cellular macromolecules from smaller precursors. Many inherited human diseases, such as albinism, result from a deficiency of a particular enzyme.

Enzymes also have valuable industrial and medical applications. The fermenting of wine, leavening of bread, curdling of cheese, and brewing of beer have been practiced from earliest times, but not until the 19th century were these reactions understood to be the result of the catalytic activity of enzymes. Since then, enzymes have assumed an increasing importance in industrial processes that involve organic chemical reactions. The uses of enzymes in medicine include killing disease-causing microorganisms, promoting wound healing, and diagnosing certain diseases.

Chemical nature. All enzymes were once thought to be proteins, but since the 1980s the catalytic ability of certain nucleic acids, called messenger RNAs, has been demonstrated, refuting this axiom. Because so little is yet known about the enzymatic functioning of RNA, this discussion will focus primarily on protein enzymes.

A large protein enzyme molecule is composed of one or more amino acid chains called polypeptide chains. The amino acid sequence determines the characteristic folding patterns of the protein's structure, which is essential to enzyme specificity. If the enzyme is subjected to changes, such as fluctuations in temperature or pH, the protein structure may lose its integrity (denature) and its enzymatic ability. Denaturation is sometimes, but not always, reversible.

Bound to some enzymes is an additional chemical component called a cofactor, which is a direct participant in the catalytic event and thus is required for enzymatic activity. A co-

factor may be either a coenzyme—an organic molecule, such as a vitamin—or an inorganic metal ion; some enzymes require both. A cofactor may be either tightly or loosely bound to the enzyme. If tightly connected, the cofactor is referred to as a prosthetic group.

Nomenclature. An enzyme will interact with only one type of substance or group of substances, called the substrate, to catalyze a certain kind of reaction. Because of this specificity, enzymes often have been named by adding the suffix “-ase” to the substrate’s name (as in urease, which catalyzes the breakdown of urea). Not all enzymes have been named in this manner, however, and to ease the confusion surrounding enzyme nomenclature, a classification system has been developed based on the type of reaction the enzyme catalyzes. There are six principal categories and their reactions: (1) oxidoreductases, which are involved in electron transfer; (2) transferases, which transfer a chemical group from one substance to another; (3) hydrolases, which cleave the substrate by uptake of a water molecule (hydrolysis); (4) lyases, which form double bonds by adding or removing a chemical group; (5) isomerases, which transfer a group within a molecule to form an isomer; and (6) ligases, or synthetases, which couple the formation of various chemical bonds to the breakdown of a pyrophosphate bond in adenosine triphosphate or a similar nucleotide.

Mechanism of enzyme action. In most chemical reactions, an energy barrier exists that must be overcome for the reaction to occur. This barrier prevents complex molecules such as proteins and nucleic acids from spontaneously degrading, and so is necessary for the preservation of life. When metabolic changes are required in a cell, however, certain of these complex molecules must be broken down, and this energy barrier must be surmounted. Heat could provide the additional needed energy (called activation energy), but the rise in temperature would kill the cell. The alternative is to lower the activation energy level through the use of a catalyst. This is the role that enzymes play. They react with the substrate to form an intermediate complex—a “transition state”—that requires less energy for the reaction to proceed. The unstable intermediate compound quickly breaks down to form reaction products, and the unchanged enzyme is free to react with other substrate molecules.

Only a certain region of the enzyme, called the active site, binds to the substrate. The active site is a groove or pocket formed by the folding pattern of the protein. This three-dimensional structure, together with the chemical and electrical properties of the amino acids and cofactors within the active site, permits only a particular substrate to bind to the site, thus determining the enzyme’s specificity.

Enzyme synthesis and activity also are influenced by genetic control and distribution in a cell. Some enzymes are not produced by certain cells, and others are formed only when required. Enzymes are not always found uniformly within a cell; often they are compartmentalized in the nucleus, on the cell membrane, or in subcellular structures. The rates of enzyme synthesis and activity are further influenced by hormones, neurosecretions, and other chemicals that affect the cell’s internal environment.

Factors affecting enzyme activity. Because enzymes are not consumed in the reactions they catalyze and can be used over and over again, only a very small quantity of an enzyme is needed to catalyze a reaction. A typical enzyme molecule can convert 1,000 substrate molecules per second. The rate of an enzymatic reaction increases with increased substrate concentration, reaching maximum velocity when all active sites of the enzyme molecules are engaged. The enzyme is then said to be saturated, the rate of the reaction

being determined by the speed at which the active sites can convert substrate to product.

Enzyme activity can be inhibited in various ways. Competitive inhibition occurs when molecules very similar to the substrate molecules bind to the active site and prevent binding of the actual substrate. Penicillin is a competitive inhibitor that blocks the active site of an enzyme that many bacteria use to construct their cell walls.

Noncompetitive inhibition occurs when an inhibitor binds to the enzyme at a location other than the active site. In some cases of noncompetitive inhibition, the inhibitor is thought to bind to the enzyme in such a way as to physically block the normal active site. In other instances, the binding of the inhibitor is believed to change the shape of the enzyme molecule, thereby deforming its active site and preventing it from reacting with its substrate. This latter type of noncompetitive inhibition is called allosteric inhibition; the place where the inhibitor binds to the enzyme is called the allosteric site. Frequently, an end-product of a metabolic pathway serves as an allosteric inhibitor on an earlier enzyme of the pathway. This inhibition of an enzyme by a product of its pathway is a form of negative feedback.

Allosteric control can involve stimulation of enzyme action as well as inhibition. An activator molecule can be bound to an allosteric site and induce a reaction at the active site by changing its shape to fit a substrate that could not induce the change by itself. Common activators include hormones and the products of earlier enzymatic reactions. Allosteric stimulation and inhibition allow production of energy and materials by the cell when they are needed and inhibit production when the supply is adequate.

enzyme analysis, in blood serum, measurement of the activity of specific enzymes in a sample of blood serum, usually for the purpose of identifying a disease. The enzymes normally are concentrated in cells and tissues where they perform their catalytic function; in disease, however, certain enzymes tend to leak into the circulation from the injured cells and tissues. More than 50 enzymes have been found in human serum; in routine clinical practice, the six most common ones are amylase, lipase, alkaline phosphatase, acid phosphatase, peptidases, and transaminases. As with other types of blood analyses, enzyme assays have been automated with autoanalyzers, which make it possible to obtain data on the serum activity of up to 20 or more enzymes simultaneously on one sample of serum.

Eocene Epoch, major worldwide division of the Tertiary Period that began about 57.8 million years ago and ended about 36.6 million years ago. It follows the Paleocene Epoch and precedes the Oligocene Epoch. The Eocene is often divided into Early (57.8 to 52 million years ago), Middle (52 to 43.6 million years), and Late (43.6 to 36.6 million years) epochs. The name Eocene is derived from the Greek *ēōs* (“dawn”) and refers to the dawn of recent life; during the Eocene, all the major divisions, or orders, of modern mammals appeared.

Eocene rocks have a worldwide distribution. In western Europe, several stages and their temporal equivalents (ages) are recognized on the basis of characteristic lithologies and fossil faunas; they are, from earliest to latest, the Ypresian, Lutetian, Bartonian, and Priabonian. In North America, stages are recognized on the basis of marine rocks and fossil assemblages as well as primarily terrestrial or continental deposits and vertebrate faunas; the vertebrate stages, which are well known and of great importance, consist, from oldest to youngest, of the Wasatchian, Bridgerian, Uintan, and Duchesnean stages. Lower Eocene assemblages are poorly represented in England and in the Patagonian region of South America. Later Eocene vertebrate faunas are

somewhat better developed in areas outside of North America; the Mokattam Beds in Egypt contain a middle Eocene vertebrate assemblage. Late Eocene faunas occur in Myanmar (Burma) and Mongolia. It is in North America, however, especially the western United States, that the most abundant and extensive Eocene record exists. Eocene rocks were deposited in much the same regions as those of the preceding Paleocene Epoch. During the Eocene, climates were warm and humid. Temperate and subtropical forests were widespread, but grasslands were of limited extent; the Eocene forests of Oregon, for instance, consisted of trees and plants similar to or identical to those now found in Central and South America.

The lower Eocene vertebrate faunas of North America and Europe are very similar; many genera occur in both regions, indicating that interchange could occur. Early Eocene faunas were essentially those of the Paleocene with the addition of newer types, but the archaic Paleocene groups gradually became extinct.

The start of the Eocene is marked by the appearance of two new groups of animals: the perissodactyls, or odd-toed ungulates; and the artiodactyls, the even-toed ungulates. The perissodactyls include the horses, rhinoceroses, and tapirs; among the artiodactyls are the deer, cattle, and sheep. The early horse ancestor, the dawn horse, known in North America as *Eohippus*, is among the fossil perissodactyls found in the lower Eocene rocks of North America and Europe. Artiodactyls, rare during the early Eocene, became abundant later in the epoch.

The archaic Paleocene primate forms declined during the Eocene; many of their ecological niches were usurped by the more efficient rodents. Middle Eocene vertebrate faunas were not as cosmopolitan as those of the early Eocene; the isolation that resulted allowed different evolutionary trends to occur in the ungulate groups of North America and Europe. Extensive interchanges of faunal elements were possible once again late in the Eocene Epoch. The Eocene Epoch marks the first appearance in the fossil record of the two completely marine mammal groups, the cetaceans (whales, porpoises, and dolphins) and the sirenians (akin to the modern manatees and dugongs). Similarly, the Eocene provides the first elephant-like animals and the early bats. Many essentially modern bird orders appeared during the Eocene.

Eocene Series, second of five main divisions (in ascending order) in the Tertiary System, representing all those rocks on a global basis that were deposited during the Eocene Epoch (57.8–36.6 million years ago). It designates a subdivision proposed in 1833 by the Scottish geologist Charles Lyell based on the percentage of fossil mollusks in Eocene strata with living representatives. Foraminifera, calcareous nannofossils, and radiolaria biozones are most widely used for biostratigraphic zonation within the series. The base of the Eocene Series has yet to be defined by a global stratotype section and point (GSSP), but the top of the series is well-defined by the base of the overlying Oligocene Series, as designated by its GSSP.

Eochaid Ollathair (Celtic mythology): *see* Dagda.

Eohippus, genus of ancestral horse. *See* dawn horse.

EOKA, abbreviation of ETHNIKÍ ORGÁNOSIS KIPRIAKOÚ AGÓNOS (Greek: “National Organization of Cypriot Struggle”), underground nationalist movement of Greek Cypriots dedicated to the expulsion of the British from Cyprus (achieved in 1960) and the eventual union (Greek *énosis*) of Cyprus with Greece.

EOKA was organized c. 1955 by Col. Georgios Grivas, an officer in the Greek Army, with the support of Makarios III, Orthodox archbishop of Cyprus. Its terrorist campaign, begun early in 1955, reached a climax in 1956, with the exile of Makarios and the temporary depletion of British forces in the island because of the Suez crisis. By early 1957, however, a reinforced British army successfully attacked the terrorists' mountain hideouts, considerably weakening EOKA, which had never numbered more than 300 men. Violence subsided after Makarios' release in March 1957, though there was a recurrence in mid-1958, when EOKA clashed with Turkish Cypriot guerrillas. In 1958 Makarios announced he would accept independence for Cyprus rather than *énosis*, and in March 1959 Grivas reluctantly disbanded his organization after obtaining amnesty for its members.

In 1971 Grivas, who had served for a time as commander of the Greek Cypriot National Guard but had been recalled by the Greek government, reentered Cyprus secretly to form EOKA B, to "prevent a betrayal of *énosis*." After Grivas' death in January 1974, his followers vowed to continue the struggle. President Makarios officially proscribed EOKA B in April 1974, three months before he was ousted and before Turkish forces landed and divided the country in a brief civil war. Thereafter, EOKA disappeared.

eolian sound, also spelled **AEOLIAN**, sound produced by wind when it encounters an obstacle. Fixed objects, such as buildings and wires, cause humming or other constant sounds called eolian tones; moving objects, such as twigs and leaves, cause irregular sounds. A wind that flows over a cylinder or stretched wire produces a sound the frequency (pitch) of which is a function of wind speed and the diameter of the cylinder or wire; it is independent of the tension, composition, and length of the wire.

Eolie Islands, Italian **ISOLE EOLIE**, Latin **INSULAE AEOLIAE**, also called **AEOLIAN ISLANDS**, or **LIPARI ISLANDS**, volcanic group in the Tyrrhenian Sea (of the Mediterranean) off the north coast of Sicily, Italy. The group, administered as part of Messina province, consists of seven major islands and several islets, with a total land area of 34 sq mi (88 sq km), lying in a general "Y" shape, the base of the "Y" being the westernmost island, Alicudi, the northern tip Stromboli, and the southern tip Vulcano. The other major islands are Lipari, Salina, Filicudi, and Panarea.

The islands represent the summits of a submerged mountain chain rising to 3,156 ft (962 m) on Salina. Seismic and volcanic activity has been known since ancient times, and the Greeks believed the islands to be the home of Aeolus, king of the winds, whence their name. Vulcano and Stromboli are active and there are fumaroles on Lipari and Panarea.

Excavations in the 20th century have established an uninterrupted archaeological record from the Neolithic period (7000–3000 BC). The volcanic obsidian, the islands' principal export in prehistoric times, has been detected as far east as Crete. Panarea has remains of a Bronze Age village (dating from 3000 BC). The Greeks established themselves in the islands early in the 6th century BC. Later there was a Carthaginian naval station, until the Romans took over in 252 BC. In Roman times, as in the Fascist era prior to World War II in the 20th century, the islands served as a place of banishment for political prisoners. In early medieval times they were conquered by the Saracens, who were expelled by the Normans in the 11th century. The Eolie Islands frequently changed hands between the Angevins of Naples and the Sicilian kings in the 14th

century. Alfonso V of Aragon annexed them to Naples, but Ferdinand II of Aragon finally united them to Sicily in the late 15th century.

Pumice is exported from the islands, and the principal agricultural product is a heavy malmsey-type wine from Lipari. There are alum quarries on Vulcano. Lipari, the chief town of the islands, is the seat of a bishop and of the important Aeolian archaeological museum; much of the remaining population is concentrated in the three towns on Lipari. Stromboli's continuously active volcano is a noted tourist attraction. There is regular steamer service to Milazzo, Messina, and Naples, and in summer a hydrofoil service to Palermo. Pop. (1991) 13,264.

eon (religion): *see* aeon.

Éon de Beaumont, Charles (-Geneviève-Louis-Auguste-André-Timothée), chevalier d' (knight of) (b. Oct. 5, 1728, Tonnerre, Fr.—d. May 21, 1810, London), French secret agent from whose name the term "eonism," denoting the tendency to adopt the costume and manners of the opposite sex, is derived.

His first mission was to the Russian empress Elizabeth in 1755, on which he seems to have disguised himself as a woman. After good service as a dragoon captain, he went to London in 1762, with the Duc de Nivernais (Louis Jules Mancini). On returning to Versailles with the Treaty of Paris ratified (1763), he received the cross of St. Louis. Sent back to London with secret instructions from the King for espionage, he became involved in a quarrel with the French ambassador but refused to return to France—afterward claiming that Louis XV had instructed him to disguise himself as a woman and to hide in the city.

Speculation began in London as to the Chevalier's sex. Eventually, in need of money, he pretended to Beaumarchais in 1775 that he was really a woman. Believing this, Beaumarchais managed to get him a pension, but Eon was ordered to return to France wearing women's dress. In 1777 he received the command, "By order of the king: Charles-Geneviève-Louis-Auguste-André-Timothée d'Éon de Beaumont is commanded to leave off the dragoon's uniform which she is wearing, and to dress according to her sex." Thenceforth he always wore women's dress. Having returned to London in 1785, he died there 25 years later. An autopsy performed two days after his death certified him male.

Eondekoeter, Melchior de (Dutch painter); *see* Hondecoeter, Melchior de.

Eos (Greek), Roman **AURORA**, in Greco-Roman mythology, the personification of the dawn. According to the Greek poet Hesiod, she was the daughter of the Titan Hyperion and the Titaness Theia and sister of Helios, the sun god, and Selene, the moon goddess. By the Titan Astraeus she was the mother of the winds Zephyrus, Notus, and Boreas, and of Hesperus (the Evening Star) and the other stars; by Tithonus of Assyria she was the mother of Memnon, king of the Ethiopians. She bears in Homer's works the epithet Rosy-Fingered.

Eos was also represented as the lover of the hunter Orion and of the youthful hunter Cephalus, by whom she was the mother of Phaethon. In works of art she is represented as a young woman, either walking fast with a youth in her arms or rising from the sea in a chariot drawn by winged horses; sometimes, as the goddess who dispenses the dews of the morning, she has a pitcher in each hand.

In Latin writings the word *aurora* was used (e.g., by Virgil) for the east.

Eospirifer, genus of extinct brachiopods, or lamp shells, found as fossils in Middle Silurian to Lower Devonian marine rocks (the Silurian Period ended and the following De-

vonian Period began about 395,000,000 years ago). The genus *Eospirifer* is closely related to

Eospirifer

By courtesy of the trustees of the British Museum (Natural History), photograph, Imfor

other genera included in the brachiopod group known as the spiriferids, a formerly important group of animals. *Eospirifer* has a moderate-sized shell bearing fine, radiating ribs (costae). Arcuate (bow-shaped) growth lines are also present.

Eötvös, József, Báró (Baron) (b. Sept. 13, 1813, Buda, Hung.—d. Feb. 2, 1871, Pest), novelist, essayist, educator, and statesman, whose life and writings were devoted to the

József Eötvös, steel engraving by C. Mahlknecht after a drawing by Miklós Barabás, 1841

By courtesy of the Petöfi Irodalmi Múzeum, Budapest

creation of a modern Hungarian literature and to the establishment of a modern democratic Hungary.

During his studies in Buda (1826–31), Eötvös became inspired with liberalism and the desire to reform Hungarian society. Between 1836 and 1841 he studied social conditions in England and France and returned deeply impressed by liberal philanthropy, Romanticism, and Utopian socialism.

Eötvös proclaimed the social mission of literature and in all his writings fought for alleviation of poverty. His first novel, *A karthausi* (1839–41; "The Carthusians"), expresses disappointment at the July Revolution in France (1830); Eötvös intended it as a criticism of feudalism in Hungary. His essays and prose works also advocated a modernized penal code and an end to poverty. *A falu jegyzője* (1845; *The Village Notary*, 1850) bitterly satirized old Hungary, and a historical novel about the 16th-century Hungarian peasant rebellion, *Magyarország 1514-ben* (1847; "Hungary in 1514") mobilized public opinion against serfdom.

Eötvös became minister of education in the revolutionary government of 1848, but disagreement with Lajos Kossuth caused him to resign later that year. Until 1851 he lived in Munich, where he began his great work, *A tizenkilencedik század uralkodó eszméinek befolyása az álladalomra* (1851–54; "The Influence of the Ruling Ideas of the 19th Cen-

tury on the State"). This work attempted to work out the principles of the French Revolution and depicted an ideal liberal state, based on English constitutional ideas and practice. Eötvös wished to base the relationship between Austria and Hungary on the principles of 1848, and the compromise of 1867 was partly his work.

His later years were devoted to political and philosophical activity. His collected reflections (published 1864) show a growing stoicism of a type peculiar to Hungarian literature of the post-revolutionary period. He played a distinguished part in the reorganization of the Hungarian Academy and maintained close relations with Western scholars. Eötvös became minister of education again after 1867 and devoted his energies to modernizing the educational system.

After the revolution, Eötvös wrote no poetry and only one novel, *Nővérék* (1857; "The Sisters"), which explained his ideas on education. Yet his literary work is of great importance. His short stories mark the beginning of a new portrayal of the peasant in Hungarian literature, and at a time when the Romantic novel was in fashion he was a pioneer of Realism.

Eötvös, Roland, Baron von (German), Hungarian LORÁND, BÁRÓ EÖTVÖS (b. July 27, 1848, Pest, Hung.—d. April 8, 1919, Budapest), Hungarian physicist who introduced the concept of molecular surface tension. His study of the Earth's gravitational field—which led to his development of the Eötvös torsion balance, long unsurpassed in precision—resulted in proof that inertial mass and gravitational mass are equivalent, later a major principle of Albert Einstein's general theory of relativity.

Eötvös, the son of Baron József Eötvös, was minister of public instruction in the Cabinet of Sandor Wekerle, resigning in 1895 to devote himself to teaching physics at the University of Budapest.

Epaminondas (b. c. 410 BC, Thebes—d. 362, Mantinea), Theban statesman and military tactician and leader who was largely responsible for breaking the military dominance of Sparta and for altering permanently the balance of power among the Greek states. He defeated a Spartan army at Leuctra (371 BC) and led successful expeditions into the Peloponnese (370–369, 369–368, 367, and 362), being killed in battle during the last of those invasions.

Epaminondas was the son of a Theban aristocrat. His father, though poor, provided him with a good education. Particularly attracted to philosophy, the boy became a devoted pupil of Lysis of Tarentum, a Pythagorean, who had settled in Thebes. Epaminondas did not at first take any part in political life but served on military expeditions. There is a legend that he saved the life of his colleague Pelopidas in battle in 385.

In 382 the Spartans took advantage of an expedition to northern Greece to conspire with a few Thebans and seize power by a sudden coup. For three and a half years the government was in the hands of this small dictatorship, backed by a Spartan garrison in the Cadmeia (the citadel of Thebes). Many of the previous leaders, including Pelopidas, were driven into exile. Epaminondas remained in private life, but when Pelopidas, returning secretly from Athens, successfully overthrew the dictatorship in 379 and frightened the Spartan garrison into surrender. Epaminondas is said to have been one of those who led the popular uprising in Thebes. No individual part is attributed to him for the next eight years, during which Thebes, in alliance with Athens, successfully fought off Sparta and reestablished its traditional leadership in a federation of the cities of Boeotia. In 371 the general war was ended at a peace conference, but Sparta and Athens combined to refuse recognition to

the Theban federation by insisting that each city of Boeotia should be a separate party to the treaty, while Thebes claimed that its federation should be treated as a single unit. Epaminondas, who was boeotarch (one of the five magistrates of the federation), maintained this position, even when it led to the exclusion of Thebes from the peace treaty. The Spartans had an army stationed on Thebes's western frontier, waiting to follow up their diplomatic success by a crushing military attack. But in the Battle of Leuctra (371) Epaminondas was ready with a tactical innovation. Instead of the usual advances of heavily armed infantry drawn up in an equal number of ranks over the whole front, he massed his troops on the left wing to the unprecedented depth of 50 ranks against an overall Spartan depth of 12. The Spartans, who according to Greek convention had their best troops on the right wing, were overwhelmed by the force of the Theban advance. The novelty consisted in striking the enemy first at their strongest, instead of their weakest, point, with such crushing force that the attack was irresistible. The defeat of the Spartans inflicted such heavy losses on the very limited numbers of the Spartan soldiers that it seriously threatened the possibility of raising another Spartan army. The Boeotian federation had been saved, and after more than a year the Theban army, once more led by Epaminondas, proceeded to press home its victory. In the winter (a most unusual season for Greek warfare) of 370–369 they invaded the Peloponnese and penetrated the valley of the Eurotas (modern Evrôtas). For the first time for at least two centuries an enemy army was in sight of Sparta. The subject population of Helots revolted, and Epaminondas re-created the state of Messenia, which had been enslaved by the Spartans for 300 years. He also encouraged the Arcadians, who had broken from Sparta's league, to found Megalopolis (Big City) as a federal capital. These new political creations served to keep Sparta in check so that it was never again a serious military power outside the Peloponnese. Epaminondas' brilliant success was met with jealousy and political opposition at home. He had stayed abroad over his year of office and was impeached on his return but acquitted. In 369–368 he led a second successful invasion of the Peloponnese, gaining further allies for Boeotia. In 367 he also served as a common soldier in an army sent to rescue his friend Pelopidas, who was a prisoner of Alexander, tyrant of Pherae (Thessaly). The expedition got into difficulties from which it was only rescued when Epaminondas was appointed general. This resulted in his reelection as boeotarch. He then returned to Thessaly and secured the release of Pelopidas. In 366 he invaded the Peloponnese for a third time, with a view to strengthening the Theban position there. He obtained assurances of fidelity from several states and, perhaps because of these assurances, decided not to overthrow the oligarchical governments that had been established by the Spartans. This was not accepted by the Theban government, which was in favour of overthrowing the oligarchs and establishing new democracies.

Athens had supported Sparta and was at war with Thebes. In 364–363 Epaminondas made a bold attempt to challenge Athens' naval empire. With a new Boeotian fleet, he sailed to Byzantium, with the result that a number of cities in the Athenian Empire rebelled against their now-threatened masters. But the next year the outbreak of civil war in the Arcadian league brought Epaminondas once more to the head of a large allied army in the Peloponnese. He was met by Sparta, Athens, and their allies in the Battle of Mantinea (362). Epaminondas repeated on a large scale the tactics of Leuctra and was once more victorious but died of a wound on the field of battle.

With his death all constructive initiative appeared to vanish from Theban policy.

(H.W.P.)

BIBLIOGRAPHY. Of ancient sources, Nepos' *Epaminondas* is vague and moralizing. Plutarch's *Life of Epaminondas* is lost but can be indirectly approached through his *Life of Pelopidas* and Pausanias. There is no important single work on the subject by a modern scholar, so it is best studied in the standard general histories. See especially M. Cary in the *Cambridge Ancient History*, vol. 6, ch. 4 (1927); and N.G.L. Hammond, *A History of Greece to 322 BC*, 2nd ed., ch. 2–3 and appendix 7 (1967), in which special attention is given to the chronological problems.

Epanagoge (Greek: "Introduction"), legal code compiled c. 879, during the reign of the Byzantine emperor Basil I, intended as the introduction to a comprehensive collection of laws to be published in Greek. Its chief importance lies in its exposition of the theory of the separation of the powers of church and state.

Based on the *Ecloga*, a law code drawn up during the reign of the Byzantine emperor Leo III the Isaurian (717–741), and the law books of the emperor Justinian I (reigned 527–565), the *Epanagoge* is original in those parts dealing with the rights and obligations of the emperor, the patriarch, and other lay and ecclesiastical dignitaries. State and church were conceived as a unity presided over by emperor and patriarch, who should work in harmony for the benefit of mankind, the emperor fostering the material well-being of his subjects, the patriarch promoting their spiritual welfare. Photius, patriarch of Constantinople during this period and defender of the autonomous traditions of the Eastern Orthodox Church, is believed to have been the author of this theory.

The *Epanagoge* served as the basis for the *Basilica*, an extensive revision of Justinian's code published during the reign of Leo VI (886–912). Many extracts from it can also be found in Slavic codes including the Russian *Book of Rules*, an administrative code.

eparch, the leading Byzantine government official from the 6th to the 11th century, entrusted with the authority to maintain public order and safety in Constantinople (modern Istanbul), the Byzantine capital. Called the "father of the city," he ranked just beneath the emperor in importance.

His authority included the direction of the lawcourts, provisioning of the city, and the conduct of trade and industry. His jurisdiction over the corporations and guilds (*collegia*) of craftsmen and traders was delineated in the *Book of the Eparch*, probably written in the 9th–10th century. His primary economic concern focussed on guilds such as those of cattle traders, butchers, fishmongers, bakers, and innkeepers, which held monopolies on supplying provisions for the capital. An entire bureau of the government, the *secretum*, acted to carry out his orders.

In 1028 the eparch Romanus Argyrus married the daughter of the dying emperor Constantine VIII (reigned 1025–28) and was later proclaimed emperor as Romanus III Argyrus (reigned 1028–34). In the 12th century the eparch's most important functions passed to other officials, and under the Palaeologian dynasty (1261–1453) the name survived only as a court title.

Epe, town and port, Lagos State, southwestern Nigeria; it lies on the north bank of the coastal Lagos Lagoon and has road connections to Ijebu-Ode and Ikorodu. A traditional settlement of the Ijebu people (a subgroup of the Yoruba), it was established by the mid-18th century as the chief port (slaves, cloth, agricultural produce) for Ijebu-Ode (17 mi [27 km] north-northwest), the capital of the

Ijebu kingdom. It later served as the refuge for the forces of Kosoko, the Yoruba king ousted from Lagos (42 miles [68 km] west-southwest) by the British in 1851. In 1892 Epe was the embarkation point for the military expedition sent by Sir Gilbert Carter, the governor of Lagos, to defeat the *awujale* (the Ijebu political and spiritual ruler) at Ijebu-Ode.

Modern Epe is a collecting point for the export of fish, cassava, corn (maize), green vegetables, coconuts, cocoa, palm produce, rubber, and firewood to Lagos. Special leaves useful in preserving kola nuts are trucked to Ijebu-Ode, Shagamu, and the other main kola-shipping towns. Epe is best known for its construction of the motorized, shallow-draft barges that navigate the coastal lagoons. Fishing is the major occupation. The town is served by secondary schools, several hospitals, and a health office. Pop. (1992 est.) 91,280.

épée, sword developed in the 19th century for use in fencing practice and contests. In early contests, fencers used blunted dueling swords and tried for a single touch on any point of the opponent's body, with no regard for the usual fencing conventions of limited target and right-of-way on attack. The number of touches required to win a match was increased to three in 1932 and five in 1955, but other rules have remained essentially the same.

The modern épée is a thrusting weapon 770 g (27.16 ounces) in weight and 110 cm (3 feet 7 inches) in overall length, with a blade 900 mm (35.43 inches) long. The blade is triangular in cross section and fairly rigid, tapering to a sharp point blunted with a stop, or button. The handguard is circular and bowl-shaped, similar to that of the foil but slightly larger.

If used with electrical scoring apparatus, the épée's tip contains a spring device that registers only touches of 750 grams or more. The device will not register an opposing hit scored more than $\frac{1}{25}$ of a second after the first. If a double hit is recorded, it is scored against both fencers.

Touches are made with the tip only, and a retreat by a fencer of more than 10 m (about 33 feet) scores as a touch against the defender. If both contestants reach five on a double hit, both are defeated.

Épée fencing is an international and Olympic Games fencing event and is also included in modern (or military) pentathlon competition. For world épée champions since 1947, see Sporting Record: *Fencing*. See also Olympic Games.

epirogeny, in geology, broad regional upwarp of the cratonic (stable interior) portions of continents. In contrast to orogeny (*q.v.*), epirogeny takes place over broad, nonlinear areas, is relatively slow, and results in only mild deformation. Phenomena accompanying epirogeny include the development of regional disconformities that gently bevel underlying strata and the formation of regressive deposits if marine incursions have taken place. Igneous intrusion and regional metamorphism rarely, if ever, are associated with epirogeny. The causes of epirogeny are not well known but may include large-scale adjustments of the continental crust to phase transitions in the Earth's mantle.

Some geologists believe that large-scale cycles of epirogeny that affect entire cratonic plates can be recognized. Strata deposited in the intervals between such cycles in North America have been called sequences and have been given formal names. The most widely

recognized of these are the Sauk Sequence (Late Precambrian to mid-Ordovician; about 650 to 460 million years ago), the Tippecanoe Sequence (mid-Ordovician to Early Devonian; about 460 to 400 million years ago), the Kaskaskia Sequence (Early Devonian to mid-Carboniferous; about 408 to 320 million years ago), and the Absaroka Sequence (Late Carboniferous to mid-Jurassic; about 320 to 176 million years ago).

epergne, dining table centrepiece—usually of silver—that generally sits on four feet supporting a central bowl and four or more dishes held by radiating branches and used to serve pickles, fruits, nuts, sweetmeats, and other small items. Occasionally, epergnes have additional holders for candles, casters, or cruet.

The earliest record of an epergne is in 1725, and extant pieces date from the 1730s. In the

George II silver epergne, by Thomas Pitts, London, 1761; in the Folger's Coffee Collection of Antique English Silver
By courtesy of the Procter and Gamble Company

late 19th century similar pieces, made largely of glass or porcelain and intended to hold flowers, came into fashion.

Eperjes (Slovakia): see Prešov.

Épernay, town, Marne *département*, Champagne-Ardenne *région*, northeastern France. It lies on the left bank of the Marne River, 17 miles (27 km) south-southwest of Reims. The archbishops of Reims held it from the 5th to the 10th century, and it then passed to the counts of Champagne and in 1642 to the Duke of Bouillon. Having been destroyed or burned more than 20 times, the town has few old buildings. With Reims, Épernay is the main centre for bottling, storing, and selling the wines of the Champagne region. Most of the town is built on chalk rock, in which numerous tunnels more than 30 miles (48 km) long have been cut for storing the wine. The Château Perrier houses a library with famous 9th-century manuscripts, as well as a wine museum and some archaeological artifacts. The town has railway repair yards and manufactures furniture, ceramics, and wood products. Pop. (1990) 27,738.

Épernon, Jean-Louis de Nogaret de La Valette, Duke (duc) d' (b. May 1554, Caumont, Fr.—d. Jan. 13, 1642, Loches), one of the most powerful new magnates in French politics at the turn of the 17th century.

Of obscure nobility, La Valette rose to prominence as a favourite of Henry III, who created him duke and peer of France in 1582. He and Anne de Joyeuse acted virtually as prime ministers in the 1580s. His rapacity was notorious, but he also showed great political ability and energy and did much to defend the crown during the civil wars of Henry's reign.

Temporarily out of favour with the king, he returned to his side after the murder of Henri, Duke de Guise (1588), and advised reconciliation with Henry of Navarre, the future Henry IV of France. When Henry III was murdered (1589), Épernon at first refused to serve Henry IV, who was then still a Protestant, and even made a secret treaty with Spain. When Henry was established as king, however, Épernon appeared at court posing as a loyal subject. He joined in every conspiracy of the reign without ever being caught, and there are grounds for believing that he helped to arrange the murder of the king by François Ravaillac, who is known to have received money from Épernon's mistress, Catherine du Tillet, and who was kept in protective custody by Épernon for a whole day after the murder (May 14, 1610). Épernon then carried out the minor

coup d'état that made Marie de Médicis regent for Henry's infant son Louis XIII, but she did not include him in her government. He fell into disgrace after Louis came into power (1617) but avenged himself by planning Marie de Médicis' escape from her exile in Blois in 1619 and supporting her in the civil war that ensued. In 1622 he was appointed governor of Guienne, where he lived in wanton luxury

Épernon, engraving by Michel L'Asne, 1632

punctuated by quarrels with the archbishop of Bordeaux. Cardinal de Richelieu deprived him of his governorship in 1638 and exiled him to Loches in 1641.

ephebus, in ancient Greece, any male who had attained the age of puberty. In Athens it acquired a technical sense, referring to young men aged 18–20. From about 335 BC they un-

derwent two years of military training under the supervision of an elected *kosmetes* and 10 *sōphronistai* ("chasteners"). At the end of the first year each ephebe received a sword and shield from the state; probably at this stage he took the ephebic oath. During their service, ephebi were exempt from civic duties and deprived of most civic rights. During the 3rd century BC, ephebic service ceased to be compulsory and the duration was reduced to one year. The *ephebia* became an institution for the wealthy classes only. By the 1st century BC foreigners were admitted, and the curriculum was expanded to include philosophic and literary studies, although the military character of the *ephebia* was not wholly lost. The system began to decay late in the 3rd century AD. In other Hellenistic cities the term ephebi was applied to youths aged 15–17.

Ephedra, the only genus of the family Ephedraceae, an evolutionally early group of low, straggling, or climbing gymnospermous desert shrubs and the only family in the order Ephedrales. *Ephedra* contains about 40 species, among them the Asiatic plants known as *ma huang*, sources of the decongestant drug ephedrine. The joint pine of the eastern Mediterranean region is *Ephedra fragilis*. The North American species include the plants joint fir and Mormon tea bush, sources of food and medicinals. The leaves, reduced to scales about one centimetre long, are opposite or whorled about the nodes of green branchlets that resemble those of the horsetail. In certain anatomical and reproductive features, the plants are close to the angiosperms.

ephedrine, alkaloid used as a decongestant drug. It is obtainable from plants of the genus *Ephedra*, particularly the Chinese species *E. sinica*, and it has been used in China for more than 5,000 years to treat asthma and hay fever. It is effective when administered orally, and its effects persist for several hours. Since 1927 synthetic ephedrine has been used in the United States as a bronchodilator and nasal decongestant and in controlling urinary incontinence. When its longer duration of action is desirable, ephedrine replaces epinephrine in nonemergency treatment of allergic reactions. Its slow action renders it useless in arresting acute allergic attacks. Ephedrine is usually used in combination with sedatives.

ephemeris, plural EPHEMERIDES, table giving the positions of one or more celestial bodies, often published with supplementary information. Ephemerides were constructed as early as the 4th century BC and are still essential today to the astronomer and navigator.

Modern ephemerides are calculated when a theory (mathematical description) of the motion of a heavenly body has been evolved, based on observations. Heavy computing and careful checking are involved. Until the 20th century, tables of logarithms were the chief aid to computation. The gradual introduction of mechanical calculators increased the speed and accuracy of the work. Of greater effect was the development of electronic calculators and computers. These have made feasible the solution of problems formerly considered impossible because of the tremendous labour involved. The simultaneous integration of the equations of motion of the five outer planets, for every 40th day, from the year 1653 to 2060 is typical.

A number of national ephemerides are published regularly. The oldest is the *Connaissance des temps*, founded in Paris in 1679 as the direct successor to a series of ephemerides originally begun by the German astronomer Johannes Kepler in 1617. The British *Nautical Almanac* and *Astronomical Ephemeris* commenced through the initiative of Nevil Maskelyne in 1766. The *American Ephemeris and Nautical Almanac* was first published in Washington, D.C., in 1852 for the year 1855.

From 1877, under the direction of the astronomer Simon Newcomb, it became the best of the national ephemerides. To avoid duplication of costs, it has since 1960 been unified with the British national publication, which at the same time was renamed *The Astronomical Ephemeris*. The two are of identical content, reproduced separately in each country; the work of computing is shared. Beginning in 1981, both national ephemerides were renamed *The Astronomical Almanac. Ephemerides of Minor Planets*, compiled and published annually by the Institute of Theoretical Astronomy, St. Petersburg, represents further international cooperation.

Ephemeris Time (ET), the first dynamical time scale in history; it was defined by the International Astronomical Union in the 1950s and was superseded by Barycentric Dynamical Time in 1984. (See dynamical time.)

Ephemeris Time could be obtained by observing the orbital position of any planet or satellite and then using an ephemeris, which lists calculated orbital positions as a function of time. The orbital position of the Earth about the Sun, as developed mathematically in the American astronomer Simon Newcomb's tables of the Sun (1898), were selected as the standard to define the numerical measure of Ephemeris Time. (The Earth and Sun are 180° apart; that is, opposite each other in the plane of the ecliptic, so that an observation of the Sun with respect to the stars gives the orbital position of the Earth.) Newcomb's tables were used to form a solar ephemeris, or a table that gives the Sun's coordinates for successive values of Ephemeris Time.

Values of Ephemeris Time were also obtained from observations of the Moon by using the lunar ephemeris for the calculated position. The lunar ephemeris, however, contains an empirical, nongravitational term, which was needed to correct for the effects of tides raised in the Earth by the Moon. The Moon was generally used to determine Ephemeris Time because of its rapid orbital motion. Very accurate positions of the Moon were obtained visually by observations of occultations of stars by the Moon. By the time Ephemeris Time was superseded in 1984, it had served two important purposes: (1) the definition of a second of Ephemeris Time served as the basis for the redefinition in 1967 of the SI second on the atomic time scale, and (2) ET was the reference scale used for comparison with rotational time to determine variations in the Earth's rotational speed from about 700 BC to AD 1955.

ephemeropteran, a member of the insect order Ephemeroptera, comprising the insects commonly known in their winged stages as mayflies, shadflies, dayflies, fishflies, or drakes. During their larval phase in fresh water or occasionally in brackish water they are called nymphs or naiads. There are approximately 2,000 known species, of which about 600 inhabit the North American continent. They are found on all land areas except Antarctica.

A brief treatment of ephemeropterans follows. For full treatment, see MACROPAEDIA: Insects.

While fossil records are incomplete, evidence suggests that ephemeropterans were present during the Upper Carboniferous Period (280,000,000 to 325,000,000 years ago). They range in size in the adult phase from 2.5 to 32 millimetres (0.1 to 1.3 inches). The life cycle encompasses four stages: egg, nymph, subimago, and imago.

In the aquatic nymphal stage, ephemeropterans have six legs, each of which ends in a claw. The body is divided into 10 segments, some of which have gills. The body terminates in two or three thin tails. Adaptation in nymphs has produced species with jaws and appendages especially suited for burrowing and species with flattened bodies for mobility

through narrow spaces and for minimizing resistance to stream currents. Other species have legs adapted for movement over river bottoms and other surface features and for adhering to aquatic vegetation.

Most ephemeropteran species remain in the nymphal stage for about a year. During this period they shed their external layer (molt) up to 50 times. Once they have matured they molt their last nymphal coat and emerge as winged subimagos or duns. Unlike all other insects, the mayfly molts again after it has acquired fully developed wings. After a period ranging from several minutes to several days, but usually overnight, the imago molts and emerges as the mature adult, known as the imago or spinner. Both imagos and subimagos are characterized by wispy tails, two pairs of thickly-veined wings, and short antennae. Both have compound eyes and are equipped with nonfunctioning mouthparts and digestive apparatus.

Mating behaviour begins shortly after entrance into the imago phase and ends with the death of both male and female following the extrusion of fertilized eggs (oviposition). The entire life span of the adult mayfly is usually only a few hours, although at least one species lives for up to two days. Mating begins with the dance of a swarm of males over water at nightfall. Females soon respond, and mating is carried out in the air. Fertilized eggs, which are produced in clusters of fewer than 50 to more than 10,000, are usually deposited by the females on the surface of water. Some species descend beneath the water to oviposit on submerged surfaces. Once deposited, eggs adhere to a submerged object or fall to the bottom; they generally hatch within two weeks.

Mayflies in all three growth stages are important in the food chains of aquatic ecosystems. As nymphs they consume algae and other aquatic vegetation and the products of organic decay, and they serve as prey for fish and a number of invertebrate carnivores. Predators of subimagos and imagos include hornets, dragonflies, bats, birds, beetles, spiders, and mammals; mayflies become food for fish once again as they mate and die at or near the surface of the water.

Ephesians, Letter of Paul to the, New Testament writing once thought to have been composed by Paul in prison but more likely the work of one of Paul's disciples, who probably wrote the text sometime before AD 90 while consulting Paul's letter to the Colossians. The words "in Ephesus" are lacking in the earliest manuscripts and citations. The letter declares that the Christian mystery (gospel) of salvation, first revealed to the Apostles, is the source of true wisdom (perhaps an indirect repudiation of Gnostic claims to esoteric knowledge of the supernatural) and that salvation through Christ is offered to Jews and Gentiles alike. The writer affirms that there is but "one Lord, one faith, one baptism, one God and Father of us all" (4:5–6), who united all things in Christ, through whose death all men are redeemed. The author exhorts his readers—parents and children, masters and slaves—to lead exemplary Christian lives and to arm themselves with the "shield of faith," "the helmet of salvation," and "the sword of the Spirit, which is the Word of God" (6:16–17), in order to resist the wiles of the devil.

Ephesus, Greek EPHEOSOS, the most important Greek city in Ionian Asia Minor, the ruins of which lie near the modern village of Selçuk in western Turkey.

In Roman times it was situated on the northern slopes of the hills Coressus and Pion and south of the Cayster (Küçük menderes) River, the silt from which has since formed a fertile plain but has caused the coastline to move

ever farther west. The Temple of Artemis, or Diana, to which Ephesus owed much of its fame and which seems to mark the site of the classical Greek city, was probably on the seaboard when it was founded (about 600 BC), one mile east by northeast of Pion (modern Panayir Dağ). In Roman times a sea channel was maintained with difficulty to a harbour well west of Pion. By late Byzantine times this channel had become useless, and the coast by the mid-20th century was three miles farther west. Ephesus commanded the west end of one great trade route into Asia, that along the Cayster valley, and had easy access to the other two, along the Hermus (Gediz) and the Maeander (Büyükmenderes) rivers.

History. Ephesus enters history in the mid-7th century BC, when it was attacked by the Cimmerians. Unlike its neighbour, Magnesia, it survived the attacks. For part of the early 6th century the city was under tyrants. Though allied by marriage to the kings of Lydia, its people could not hold back the Lydian Croesus, who asserted a general suzerainty over the city. He did, however, present many columns and some golden cows for a new and splendid rebuilding of the Artemiseum (Temple of Artemis). At this time, according to Strabo, the Ephesians began to live in the plain; and to

this period, too, should be allotted the redrafting of the laws, said to have been the work of an Athenian, Aristarchus. Ephesus soon submitted to Cyrus of Persia. Early in the Ionian revolt (499–493 BC) against the Persians, Ephesus served as a base for an Ionian attack on Sardis; but it is not mentioned again until 494, when the Ephesians massacred the Chiot survivors of the Battle of Lade. The massacre may have occurred because Ephesus was a commercial rival of the chief rebels, Chios and Miletus. Ephesus maintained friendly relations with Persia for about 50 years: in 478 Xerxes, returning from his failure in Greece, honoured Artemis of Ephesus, although he sacked other Ionian shrines, and left his children for safety in Ephesus; and Themistocles landed there in the 460s on his flight to Persia. But after 454 Ephesus appears as a regular tributary of Athens. Great Ephesians up to this time had been Callinus, the earliest Greek elegist (mid-7th century BC), the satirist Hipponax, and the famous philosopher Heraclitus, one of the Basilids.

Ephesus shared in a general revolt of 412 BC against Athens, siding with Sparta in the Second Peloponnesian War, and remained an effective ally of Sparta down to the end of the war. Threatened by Persia after 403, Ephesus served in 396 as the headquarters of King Agesilaus of Sparta. In 394 the Ephesians deserted to Conon's anti-Spartan maritime league, but

by 387 the city was again in Spartan hands and was handed by Antalcidas to Persia. There followed the pro-Persian tyranny of Syrophax and his family, who were stoned to death in 333 on Alexander the Great's taking the city. After 50 years of fluctuating fortune, Ephesus was conquered by the Macedonian general Lysimachus and resettled around Coressus and Pion (286–281 BC). Lysimachus introduced colonists from Lebedus and Colophon and renamed the city after his wife, Arsinoö—a name soon dropped. This was the beginning of Ephesus' Hellenistic prosperity. It became conspicuous for the abundance of its coinage.

After the defeat of Antiochus the Great, king of Syria, by the Romans in 189 BC, Ephesus was handed over by the conquerors to the king of Pergamum. Attalus III of Pergamum bequeathed Ephesus with the rest of his possessions to the Roman people (133 BC). Thenceforth, Ephesus remained subject to Rome, except for a brief time beginning in 88 BC, when, at the instigation of Mithradates the Great of Pontus, the cities of Asia Minor revolted and killed their Roman residents. The Ephesians even killed those Romans who had fled for refuge to the Artemiseum; notwithstanding which they returned in 86 BC to their former masters. Their claim, preserved on an extant inscription, that in admitting Mithradates they had merely yielded to superior force was rudely brushed aside by Sulla, who inflicted a very heavy fine. Although it twice chose the losing side in the Roman civil wars and although it was stoutly opposed by Pergamum and Smyrna, Ephesus became under Augustus the first city of the Roman province of Asia. The geographer Strabo wrote of its importance as a commercial centre in the 1st century BC. The triumphal arch of 3 BC and the aqueduct of AD 4–14 initiated that long series of public buildings, ornamental and useful, that make Ephesus the most impressive example in Greek lands of a city of imperial times.

Meanwhile the Christian Church began to win converts. A famous protest in the theatre against the teachings of St. Paul, described in Acts 19, is dated about AD 57. According to local belief Ephesus was the last home of the Virgin, who was lodged near the city by St. John and died there. The tradition that St. Luke also died there seems to be less strongly supported. Ephesus was one of the seven churches of Asia to which the Revelation to John was addressed.

The Goths destroyed both city and temple in AD 262, and neither ever recovered its former splendour. The emperor Constantine, however, erected a new public bath, and Arcadius rebuilt at a higher level the street from the theatre to the harbour, named after him, the Arkadiane. A general council of the church, held at Ephesus in 431 in the great double church of St. Mary, condemned Nestorius and justified the cult of the Virgin as Theotokos (Mother of God). A few years later, according to legend, the Seven Sleepers of Ephesus (a group of 3rd-century Christian martyrs) were miraculously raised from the dead. They too became the object of a famous cult. The emperor Justinian built the magnificent basilica of St. John in the 6th century. By the early Middle Ages, the city was no longer useful as a port and fell into decline; late Byzantine Ephesus, conquered by the Seljuqs in 1090, was merely a small town. After brief splendour in the 14th century, even this was deserted, and the true site of the Artemiseum remained unsuspected until 1869.

Excavations and extant remains. J.T. Wood, working at Ephesus for the British Museum between 1863 and 1874, excavated the odeum and theatre. In May 1869 he struck a corner of the Artemiseum. His excavation exposed to view not only the scanty remains of the latest edifice (built after 350 BC) but the platform below it of an earlier temple of

(Top) Principal sites of Hellenistic and Byzantine Ephesus; (bottom) ruins of the odeum, 2nd century AD

(Top) Adapted from J. Keil, *Ephesus* (1964), Austrian Archaeological Institute, Vienna, (bottom) Ara Güler

identical size and plan subsequently found to be that of the 6th century BC, to which Croesus contributed. The sculptured fragments of both temples were sent to the British Museum. In 1904 D.G. Hogarth, heading another mission from the museum, examined the earlier platform and found beneath its centre the remains of three yet older structures. In its earliest known phase the temple was apparently a small platform of green schist, containing a sealed deposit of primitive coins and other objects. These date from c. 600 BC.

It is impossible to assign the various architects named by ancient authors to the respective phases of the temple. At best, Chersiphron and Metagenes can be tentatively assigned to the Temple of Croesus, Chirocrates or Dinocrates to that of the 4th century. There had perhaps been some repairs toward 400 BC, associated with the architects Paeonius and Demetrius and with the prize-winning dedicatory hymn of the famous musician Timotheus. The Artemiseum passed rapidly through three phases before c. 550 BC. The Temple of Croesus (the fourth phase) was remarkable for its great size (it was more than 300 feet long and 150 feet wide), for the carved figures around the lower drums of its columns (*columnae caelatae*), and for the smaller but elaborate figured friezes along its roof gutter (*simā*). Croesus' temple seems to have been burned down in 356 BC. The new temple built shortly afterward copied the old in its *columnae caelatae*, one of which was by Scopas; but the new *simā*, instead of small, crowded figures, had a more conventional, if vigorous, *rinceau* ornament. The cella contained, among other great works, the Amazons of Polyclitus, Phidias, and Cresilas.

Lysimachean Ephesus has been continuously excavated since 1894 by the Austrian Archaeological Institute, but so solid and extensive is the Roman town that by the early 1960s the Austrians had rarely penetrated to Hellenistic levels.

On the hill of Ayasoluk (Hagios Theologos) is Justinian's church of St. John the Theologian, built around a shrine variously associated in the early Middle Ages with the death or bodily assumption of St. John. The church, uncovered since 1922, is a noble structure but badly restored. On the hill there is also a beautiful Seljuq mosque dedicated in 1375.

The public buildings of the city are arranged in a rectangular street pattern going back to Hellenistic days. They include the theatre, capable of seating nearly 25,000 spectators and completed in its present form under Trajan; the agora (marketplace), surrounded by stoas (sheltered promenades), dating from the time of Severus; the library of Celsus, also Trajanic and well known because of its facade; and an immense array of baths and gymnasiums.

All these buildings are to the west of Pion. On its north side is the stadium and north of this the gymnasium of Publius Vedius Antoninus, relatively small but very complete and with a notable chapel for the cult of Antoninus Pius. South of Pion were the odeum—another gift of Vedius—a roofed semicircular theatre to hold 1,400 persons; also a series of fountains and aqueducts, notably the aqueduct of Gaius Sextilius Pollio, which crossed the valley from Coressus. The unmortared city wall along the crest of Coressus appears to be that of Lysimachus.

Of the early Byzantine city, besides the stretch of curtain wall on Panajir Dağ, there remain the ruined church of the Seven Sleepers to its east and the long double basilica of the Virgin, the scene of the council, to its west. This basilica was rebuilt several times; it was largely around this building, between the great gymnasiums and the stadium of the classical city, that the early Byzantine Ephesians gathered.

Wood, *Modern Discoveries on the Site of Ancient Ephesus* (1890).

Ephesus, councils of, three assemblies held in Asia Minor to resolve problems of the early Christian Church.

In 190 Polycrates, bishop of Ephesus, convened a synod to establish the 14th of Nisan (the date of the Jewish Passover) as the official date of Easter. Pope Victor I, preferring a Sunday as more convenient and desiring uniformity, repudiated the decision and separated the rebels from Rome.

In 431 Pope Celestine I commissioned Cyril, patriarch of Alexandria, to conduct proceedings against Nestorius, his longtime adversary, whose doctrine of two Persons in Christ the Pope had previously condemned. When the Eastern bishops (more sympathetic to Nestorius) arrived and learned that the council summoned by Emperor Theodosius II had been started without them, they set up a rival synod under John of Antioch and excommunicated Memnon, bishop of Ephesus, along with Cyril. When Pope Celestine pronounced his excommunication of Nestorius and ratified his deposition as bishop of Constantinople, the Emperor abandoned his neutral position and sided with Cyril. Perhaps as a rebuke to the rebels, the council also made the Church of Cyprus independent of the see of Antioch. This council is known as the third ecumenical council of the church.

In 449 Emperor Theodosius II convened a council in Ephesus to uphold the Monophysite Eutyches in his battle against Flavian, who, as patriarch of Constantinople, championed the doctrine of two natures in Christ. Dioscorus (Cyril's successor at Alexandria) supported Eutyches and concurred in the anathematization of Flavian and other bishops over the protests of the papal legate. Dioscorus even attempted to excommunicate Pope Leo I, who referred to the gathering as the "Robber Synod." The Monophysite doctrine of the one nature of Christ was condemned in 451 during the Council of Chalcedon.

not letter by letter*

Ephialtes (d. 461 BC), leader of the radical democrats at Athens in the 460s, who by his reforms prepared the way for the final development of Athenian democracy. His hostility toward Sparta and his advocacy of power for the Athenian common people made him the enemy of the pro-Spartan politician Cimon, who had the support of the nobles. Elected general soon after 465, Ephialtes unsuccessfully opposed (462) the sending of an Athenian contingent under Cimon to assist in putting down a revolt of the helots in Sparta. The Spartans, however, dismissed the Athenian troops sent to relieve them. Outrage over the dismissal swung Athenian opinion in Ephialtes' favour, so that he was able in 462/461 to carry measures stripping the aristocratic court, the Areopagus, of its political power and to establish the dominance of the Ecclesia (the Popular Assembly), the Boule (Council), and law courts. Opposition to these measures resulted in the assassination of Ephialtes, but his political revolution was consolidated.

ephod, also spelled EFOD, part of the ceremonial dress of the high priest of ancient Israel described in the Old Testament (Ex. 28:6-8; 39:2-5). It was worn outside the robe and probably kept in place by a girdle and by shoulder pieces, from which hung the breast piece (or pouch) containing the sacred lots

(divinatory objects), Urim and Thummim, whose precise function is now unknown. It is uncertain whether the ephod covered the back, encircling the body like a kind of waistcoat, or only the front. It was not a garment in the ordinary sense, and its association with the sacred lots indicates that the ephod was used for divination.

A similar vestment, made of linen, was worn by persons other than the high priest. Samuel wore the ephod when he served before the tabernacle at Shiloh (I Sam. 2:18), as did David when he danced before the Ark at its entry into Jerusalem (II Sam. 6:14).

ephor (Greek *ephoros*), title of the highest Spartan magistrates, five in number, who with the kings formed the main executive wing of the state. In antiquity, time periods were recorded by the names of the ephors on a list that dated back to 754 BC. The origins of the ephorate are uncertain, however, being variously ascribed to the reforms of Lycurgus and to the necessity of maintaining state authority in the absence of the kings during the Messenian Wars.

Every adult male citizen was eligible for election, which was annual. In classical times an oath was sworn monthly: by the kings that they would observe the laws; by the ephors on behalf of the city that on this condition they would maintain the king's authority. The ephors presided over meetings of the council of elders, or *gerousia*, and assembly, or *apella*, and were responsible for the execution of their decrees. Their extensive police powers allowed them to make the annual declaration of war on the helots and, in emergency, arrest, imprison, and participate in the trial of a king. The most famous of them was Chilon in the middle of the 6th century BC, one of the Seven Wise Men of Greece.

Ephorus (b. c. 405 BC, Cyme, Aeolis—d. 330 BC), Greek historian, the author of the first universal history, who, despite his defects, was esteemed in classical times and is considered the best of the historians writing in his period.

According to uncertain tradition, Ephorus was the pupil of Isocrates, whose school rivalled Plato's Academy in fame. Ephorus' *Historiai*, his major work, was completed with a 30th book added by his son Demophilus, who edited the entire work. It begins with the return of the Heracleidae to Peloponnesus and ends with the siege of Perinthus (340) by Philip II of Macedonia, with a further extension in the 30th book which centres on the Second Sacred War of 355-46. Ephorus was the first historian to divide his work into books, to each of which he wrote a preface, and he treated his material under subject headings rather than chronologically. The work shows a critical historical sense: Ephorus usually (though not always) distinguished clearly between the mythical and the historical and recognized that any account of far-distant history that is too detailed should be viewed with some suspicion.

Ephorus' work was used as a source by Diodorus Siculus, whose chronological blunders arise in part from trying to reproduce him in annalistic form. Polybius gave Ephorus credit for knowledge of naval warfare conditions but belittled his descriptions of certain land operations.

Several other works have been attributed to Ephorus, including a treatise on discoveries, another on the history and antiquities of Cyme, and an essay on style.

Ephraem SYRUS, SAINT, SYRIAN APHREM, also called EPHRAIM THE SYRIAN, DEACON OF EDESSA, OF HARP OF THE HOLY SPIRIT (b. c. 306, Nisibis, Mesopotamia—d. June 9, 373, Edessa, Osroëne; Western feast day June

9, Eastern feast day January 28), Christian theologian, poet, hymnist, and doctor of the church who, as doctrinal consultant to Eastern churchmen, composed numerous theological-biblical commentaries and polemical works that, in witnessing to the common Christian tradition, have exerted widespread influence on the Greek and Latin churches. He is recognized as the most authoritative representative of 4th-century Syriac Christianity.

Deacon to Bishop James of Nisibis and tutor in theology, Ephraem went to teach at the academy in Edessa when his native town was ceded to the Persians in 363; his record of these events in verse, *Carmina Nisibena* ("Songs of Nisibis") constitutes a valuable historical source. Declining any higher office in the church (he escaped being consecrated bishop by feigning madness) and tempering his natural irascibility by monastic asceticism, he produced a wealth of theological literature. The 5th-century Byzantine historian Sozomen credits Ephraem with more than 1,000 writings, composed of approximately 3,000,000 lines. As a biblical exegete, Ephraem wrote commentaries on the Old Testament books of Genesis and Exodus and annotated the important 2nd-century Syriac-Greek version of the New Testament, the *Diatessaron*. His favourite literary form was verse, in which he composed treatises, sermons, and hymns; the result, in early Syriac, is often tedious because of expansive metaphor and allegory. Much of his hymnology was directed against the principal heresies of his day, particularly the teachings of Marcion and Bardesanes, 2nd-century Gnostics. Certain hymns attacked Christological heterodoxy, especially Arianism, while others extoll the church as the continuation of Christ on earth, the theology of faith, the moral superiority of virginity, and the phases of Christ's mission in his Passion and Resurrection. According to historians of the 5th century Christians gave enthusiastic prominence to these hymns in their liturgical assemblies. Ephraem further emphasized devotion to the Virgin Mary, particularly her sinlessness and exemplary fidelity. Additional doctrinal themes integrated in his prose and poetry include the Trinitarian teaching on the eternity of Father, Son, and Spirit; the union of divinity and humanity in Christ; the essential function of the Holy Spirit in prayer, especially in rendering Christ's actual Presence in the celebration of Communion; the resurrection of all men, wherein he maintained the traditional Syriac belief that each individual would need to await the end of the world (the Last Judgment) to gain heavenly beatitude. Ephraem's graphic description of heaven and hell contributed to the inspiration of Dante's *Divine Comedy*.

Modern scholars have undertaken the critical reconstruction of Ephraem's original texts, heretofore frequently edited and altered to suit the personal views of the various redactors, many of whose editions are full of defective translations and interpolations in their Greek and Latin versions. The most complete collection in Syriac and Greek is that of J.S. and S.E. Assemani (6 vol., 1732-46), while supplementary material has been supplied by T. Lamy (Malines, Belgium, 1882-1902). English translations of selections from Ephraem's writings are available in his *Hymns and Homilies*, edited by H. Burgess (2 vol., 1835), and in the edition of J. Gwynn in the collection *Nicene and Post-Nicene Christian Fathers* (1898). Pope Benedict XV formally declared Ephraem a doctor of the church in 1920.

Ephraim, one of the 12 tribes of Israel that in biblical times comprised the people of Israel who later became the Jewish people. The tribe

was named after one of the younger sons of Joseph, himself a son of Jacob.

After the death of Moses, Joshua, an Ephraimite, led the Israelites into the Promised Land and assigned territory to each of the 12 tribes. Members of his tribe settled in the fertile, hilly region of central Palestine. They gradually gained great power, for the Ephraimites acted as hosts to the tribal assemblies and had within their borders such religiously important centres as Shiloh and Bethel.

In 930 BC the tribe of Ephraim led the 10 northern tribes in a successful revolt against the south and established the Kingdom of Israel, with Jeroboam I, an Ephraimite, as king. The seventh king of Israel, Ahab (reigned c. 874-c. 853 BC), was also an Ephraimite. His generally peaceful reign was marred by the worship of the Canaanite god Baal by his wife, Jezebel. From about 745 BC, the northern kingdom was often referred to as the Kingdom of Ephraim, a reflection of the tribe's importance. Assyrian conquerors overran the kingdom in 721 BC, dispersing some of the inhabitants and gradually assimilating others, occurrences that account for the eventual disappearance of the tribe of Ephraim along with the nine other northern tribes. They have become known in legend as the Ten Lost Tribes of Israel.

Ephraim THE SYRIAN: see Ephraem Syrus, Saint.

Ephrata Community, U.S. Protestant monastic settlement, an offshoot of the Germantown Dunkers, founded in 1732 by Johann Conrad Beissel on Cocalico Creek in Lancaster County, Pa.; the present town of Ephrata grew up around it. Beissel and his followers observed the sabbath on the seventh day and espoused ascetic ideals. In the Ephrata cloisters the members, both men and women, were celibate, worked hard, ate a mainly veg-

Ephrata Community cloisters, Ephrata, Pa.

etarian diet, and lived in tiny cells, where they slept on benches with wooden blocks as pillows, interrupting their sleep for lengthy prayer vigils. Frequent hymn singing was part of their regimen. "Outdoor members" were permitted marriage and lived according to a more relaxed discipline.

The community thrived in the mid-18th century, building quarters of a remarkable architectural originality and establishing a gristmill, a papermill, and in 1745 a printing press. Affiliated communities were founded in Germantown and at Snow Hill in Franklin County. After Beissel's death (1768) the community declined, and during the Revolution the community was decimated by smallpox. Although Beissel's followers were pacifists, they extended hospitality to American Revolutionary soldiers and cared for those wounded in the

Battle of Brandywine (1777); the community press printed Continental dollars.

In 1786 the community first allowed private ownership of property, and by 1814 the remaining members reorganized themselves as the Seventh Day German Baptists. The Ephrata congregation was dissolved in 1934, but two small congregations continued in central Pennsylvania in the late 1970s.

Epi, formerly **TASIKO**, or **VOLCANO**, island of Vanuatu, in the southwestern Pacific Ocean. Volcanic in origin, it is 27 mi (43 km) long and 11 mi wide, with an area of 171 sq mi (444 sq km), and rises to 2,733 ft (833 m). Although it is fertile, Epi's copra plantations are deteriorating. There is a Presbyterian hospital at Vaemali, on the north coast. Pop. (1989) 3,268.

EPI (navigation): see Ioran.

epic, long narrative poem in an elevated style celebrating heroic achievement and treating themes of historical, national, religious, or legendary significance. It is to be distinguished from the briefer heroic lay, the less elevated, less ambitious folktale and ballad, and the more consistently extravagant and fantastic medieval romance, though in the narrative poetry of Ariosto, Boiardo, and Spenser the categories tend to merge. One may also distinguish "primary" or traditional epic, shaped from the legends and traditions of a heroic age, from "secondary" or literary epic self-consciously produced by sophisticated poets adapting aspects of traditional epic for specific literary and ideological purposes. Homer's *Iliad* and *Odyssey* are primary epics; Virgil's *Aeneid* and Milton's *Paradise Lost* are secondary epics.

A brief treatment of the epic poem follows. For full treatment, see **MACROPAEDIA: Literature, The Art of**.

While the Mesopotamian verse-narratives of Gilgamesh, dating from the 3rd millennium BC, have claims to constitute the earliest epic, the Homeric poems, which assumed their final form in the period 900-750 BC, are usually regarded as the first important epics and the main source of epic conventions and characteristics in the secondary epics of western Europe. It is now generally agreed that such Homeric features as descriptive set-pieces, stock epithets, and formulaic phrases and lines for recurring elements of the poem are attributable to narrative and metrical convenience in improvised oral composition and transmission.

The main aspects of epic convention are the centrality of a hero, sometimes semidivine, of military, national, or religious importance; an extensive, perhaps even cosmic, geographical setting; heroic battle; extended and often exotic journeying; and the involvement of supernatural beings in the action. Epics usually begin with a statement of the theme, invoking the assistance of a muse, and then plunge into the middle of the story, filling in the earlier stages later on with retrospective narrative by figures within the poem. Since epic subject matter tends to be familiar and traditional, this permits immediate dramatic involvement without bewildering the audience. Catalogs and processions of heroes, often associated with specific localities, are common, and when such heroes speak it is often in set speeches delivered in formal circumstances. Epic narrative is often enriched by extended epic similes that go beyond an initial point of correspondence to elaborate a whole scene or episode drawn from a different area of experience.

The self-consciousness of literary epic and its cultural context in a post-heroic age encourage an element of criticism, ironic deployment, or even parody of standard epic materials and conventions. This is already present in the *Aeneid*, in which epic battle may be brutal and degrading as well as heroic, and Milton

in *Paradise Lost* attributes to his villain Satan many of the characteristics of the old warring hero of epic tradition. The heroic world with its formal conventions, supernatural "machinery," and epoch-making events may be used as a framework to recount trivial, squalid, or irreverent matters for satiric purposes in poems such as Alexander Pope's *The Rape of the Lock* and *The Dunciad* and Lord Byron's *Don Juan*. Henry Fielding exploited the dignity and structure of epic and a sense of its incongruity with contemporary experience with comic effect in *Tom Jones*, while later novels such as James Joyce's *Ulysses* have achieved epic stature by recreating Homeric materials.

Primary epics registering heroic experience in the vernacular languages of Europe continued to appear long after Virgil popularized secondary epic. The Spanish *Poema de mio Cid* ("Song of My Cid") celebrates the hero of the wars against the Moors in the 11th century; the 12th-century French *La Chanson de Roland* ("The Song of Roland") commemorates an 8th-century battle in the Pyrenees between Charlemagne's army and the Saracens; the 13th-century German *Nibelungenlied* ("Song of the Nibelungs") recounts a story that derived ultimately from the war between the Burgundians and the Huns in the 5th century; and the Anglo-Saxon *Beowulf* refers to historical characters and events of the 6th century as it describes Beowulf's struggles against the monsters that threaten the heroic fellowship of the mead-hall. But long before these poems assumed the form in which they now exist, the historical elements in them had passed into myth and attracted other legendary materials and themes from other periods and traditions. The *Kalevala* (1835; enlarged 1849; "Land of Heroes"), the Finnish national poem, is a synthetic primary epic that incorporates ancient orally transmitted lays into a single narrative structure.

The epic poem was generally regarded as a superseded form in the 20th century.

epic formula, convention of language and theme peculiar to oral epic poetry that is often carried over to the written form. The most obvious epic formulas are the "fixed epithets," stereotyped descriptive phrases that can be varied in different places in the poetic line to suit the demands of the metre. These stock expressions have the twofold function of lightening the oral poet's task in telling the story and making it easier for the audience to follow him. In the Homeric poems, Achilles is "fleet-footed" whether he is sitting, standing, or sleeping. Odysseus is "wily," dawn is "rosy-fingered," and the heroes exchange "winged words." Homer uses numerous less striking formulas to describe everyday activities: for example, a meal usually ends "when they had put aside desire for food and drink." To a great extent epic formulas are distinctive features of an epic.

Because written epics are a later development of the genre, they all bear some trace of the underlying oral stamp. In literary epics, however, the formulas have lost their special function as mnemonic adjuncts to the oral poet's storytelling. They are employed rather for their archaic charm and heroic connotations.

epic theatre, German EPISCHES THEATER, form of didactic drama presenting a series of loosely connected scenes that avoid illusion and often interrupt the story line to address the audience directly with analysis, argument, or documentation. Epic theatre is now most often associated with the dramatic theory and practice evolved by the playwright-director Bertolt Brecht in Germany from the 1920s onward. Its dramatic antecedents include the episodic structure and didactic nature of the pre-Expressionist drama of the German playwright Frank Wedekind and the Expressionist theatre of the German directors Erwin Piscator (with whom Brecht collaborated in 1927)

and Leopold Jessner, both of whom made exuberant use of the technical effects that came to characterize epic theatre.

Brecht's perspective was Marxian, and his intention was to appeal to his audience's intellect in presenting moral problems and reflecting contemporary social realities on stage. He wished to block their emotional responses, and to hinder their tendency to empathize with the characters and become caught up in the action. To this end, he used "alienating" or "distancing" effects to cause the audience to think objectively about the play, to reflect on its argument, to understand it, and to draw conclusions.

Brecht's epic theatre was in direct contrast to that encouraged by the Russian director Konstantin Stanislavsky, in which the audience was persuaded—by staging methods and naturalistic acting—to believe that the action onstage was "real." Influenced by conventions of Chinese theatre, Brecht instructed his actors to keep a distance between themselves and the characters they portrayed. They were to disregard inner life and emotions while emphasizing stylized external actions as signs of social relationships. Gesture, intonation, facial expression, and grouping were all calculated to reveal overall attitudes of one character toward another. Compare Stanislavsky method.

epicentre, point on the surface of the Earth that is directly above the source of an earthquake (called the focus). There the effects of the earthquake usually are most severe. The epicentre can be located by constructing arcs from each of three or more seismic observatories, with the arcs' radii equal to the distance from each station to the focus of the earthquake. The point of intersection of the arcs marks the epicentre.

Epicharmus (b. c. 530 BC—d. c. 440 BC), Greek poet who, according to the *Suda* lexicon of the 10th century AD, was the originator of Sicilian (or Dorian) comedy. He was born in a Dorian colony, either Megara Hybaea or Syracuse, both on Sicily, or Cos, one of the Dodecanese islands. He has been credited with more than 50 plays written in the Sicilian dialect; titles of 35 of his works survive, but the remains are scanty.

Many of Epicharmus' plays were obviously mythological burlesques in which even the gods were satirized. Major features of his works were set debates, and the stock characters, such as the parasite and the rustic, were later characteristic of Middle and New Comedy. Some of his titles suggest parodies of tragedies.

Epicharmus' style was lively, and his comedies seem more akin to mime and to New Comedy than to the Old Comedy of his time. They were apparently short and largely farcical but contained an admixture of philosophical moralizing in the form of gnomic maxims. These maxims were later collected separately and sometimes forged; hence, perhaps, his posthumous reputation in antiquity as a philosopher. Ancient authorities also attributed to him works on ethics and medicine, and tradition made him a pupil of Pythagoras.

epiclesis (Greek: "invocation"), in the Christian eucharistic prayer (anaphora), the special invocation of the Holy Spirit; in most Eastern Christian liturgies it follows the words of institution—the words used, according to the New Testament, by Jesus himself at the Last Supper—"This is my body . . . this is my blood"—and has a clearly consecratory character. The epiclesis specifically asks that bread and wine be made the body and blood of Christ, and the actual change (Greek: *metabolē*) is attributed to the Holy Spirit. It reflects the prevailing sacramental theology of the Eastern Church, which interprets the effectiveness of the sacraments as an answer of God to the prayer of the

church rather than as a result of the vicarious powers of a priest pronouncing the appropriate formula. The epiclesis also maintains the trinitarian character of the eucharistic prayer, which is addressed to the Father, commemorates the saving action of the Son, and invokes the power of the Spirit.

In the 14th century the epiclesis became an issue in the polemics between Greeks and Latins, because all Eastern eucharistic prayers included an invocation of the Holy Spirit while the Roman canon of the mass did not. Most modern scholars agree that there had been an epiclesis in the original Eucharist of the early church of Rome, in addition to the other Latin eucharistic prayers. Medieval Latin theology, however, allowed for the disappearance of the epiclesis since it was believed that the consecration of bread and wine and their transubstantiation into the body and blood of Christ took place when the priest pronounced the words of institution.

The question of the epiclesis was debated at the Council of Ferrara-Florence (1438–45), but no formal definition was made. The medieval Latin view was then endorsed by the Council of Trent (1545–63), but the liturgical reforms adopted in Roman Catholicism after the second Vatican Council (1962–65) include an epiclesis in the canon of the mass. This epiclesis, however, is placed before the words of institution so that the consecratory function of the latter can still be maintained.

Epictetus (fl. c. 520–500 BC), Greek potter and painter who worked in Athens. His work is praised for its care, grace, vitality, delicate line, and fine draftsmanship. He signed his works as both maker and decorator.

Epictetus is most frequently mentioned in connection with a series of medallions on plates in the British Museum in London and

"Barbarian Archer in Scythian Costume," Athenian plate by Epictetus, late 6th century BC; in the British Museum

By courtesy of the trustees of the British Museum

the Cabinet des Médailles in Paris. The medallion paintings represent a "Young Man on his Horse" and a "Man" (possibly Silenus) on his way home from a banquet.

A kylix (drinking cup), found in Vulci and now in the British Museum, is signed "Python made [it]; Epictetus painted [it]." Dating from 520–510 BC, it features the paintings "Flute Player and Dancer," on the inside, and "Heracles Slaying Busiris," on the outside.

Epictetus (b. c. AD 55, probably at Hierapolis, Phrygia [now Pamukkale, Turkey]—d. c. 135, Nicopolis, Epirus [Greece]), Greek philosopher associated with the Stoics, remembered for the religious tone of his teachings, which commended him to numerous early Christian thinkers.

His original name is not known; *epiktētos* is the Greek word meaning "acquired." As a boy he was a slave but managed to attend lectures by the Stoic Musonius Rufus. He later became a freedman and lived his life lame and in ill health. In AD 90 he was expelled from Rome with other philosophers by the emperor Domitian, who was irritated by the favourable reception given by Stoics to opponents of his tyranny. The rest of his life Epictetus spent at Nicopolis.

As far as is known, Epictetus wrote nothing. His teachings were transmitted by Arrian, his pupil, in two works: *Discourses*, of which four books are extant; and the *Encheiridion*, or *Manual*, a condensed aphoristic version of the main doctrines. In his teachings Epictetus followed the early rather than the late Stoics, reverting to Socrates and to Diogenes, the philosopher of Cynicism, as historical models of the sage. Primarily interested in ethics, Epictetus described philosophy as learning "how it is possible to employ desire and aversion without hindrance." True education, he believed, consists in recognizing that there is only one thing that belongs to an individual fully—his will, or purpose. God, acting as a good king and father, has given each being a will that cannot be compelled or thwarted by anything external. Men are not responsible for the ideas that present themselves to their consciousness, though they are wholly responsible for the way in which they use them. "Two maxims," Epictetus said, "we must ever bear in mind—that apart from the will there is nothing good or bad, and that we must not try to anticipate or to direct events, but merely to accept them with intelligence." Man must, that is, believe there is a God whose thought directs the universe.

As a political theorist, Epictetus saw man as a member of a great system that comprehends both God and men. Each human being is primarily a citizen of his own commonwealth, but he is also a member of the great city of gods and men, of which the political city is only a poor copy. All men are the sons of God by virtue of their rationality and are kindred in nature with the divinity. Thus, man is capable of learning to administer his city and his life according to the will of God, which is the will of nature. The natural instinct of animated life, to which man also is subject, is self-preservation and self-interest. Yet men are so constituted that the individual cannot secure his own interests unless he contributes to the common welfare. The aim of the philosopher, therefore, is to see the world as a whole, to grow into the mind of God, and to make the will of nature his own.

Epicureanism, in a strict sense, the philosophy of the ancient Greek Epicurus (341–270 BC); and in a broad sense, a system of ethics embracing every conception or form of life traceable to the principles of his philosophy. Epicureanism espouses, in physics, Atomism and a largely mechanical conception of causality, with the gods remaining extraneous; and, in ethics, the identification of good with pleasure and the absence of pain, utility and the limitation of desire, and a withdrawn and quiet life enriched by the company of friends.

A brief treatment of Epicureanism follows. For full treatment, see MACROPAEDIA: Philosophical Schools and Doctrines.

After having taught in a number of cities in Asia Minor, Epicurus established his permanent home in Athens and founded a school of philosophy, teaching his pupils in his garden, which he bequeathed to the school under his will. As the society that he gathered round him included women as well as men, it frequently met with public scandal and even persecution. Nonetheless communities modelled on the

original garden were founded throughout the Mediterranean world. In modern philosophy, the most significant revival of Epicureanism was the Christian interpretation developed by Pierre Gassendi in the 17th century.

Ethics. The philosophic outlook of Epicurus was fundamentally ethical, and his concern with other studies seems to have been small. Even his interest in physics is purely subsidiary to the ethical end; *i.e.*, to obtaining a theory of life that shall ensure "quietude of mind and a steadfast faith."

For Epicurus the sole criterion of good and evil is sensation; so that "we declare pleasure to be the beginning and end of the blessed life." However, while every pleasure is in itself good, not all pleasures are to be chosen, since certain pleasures are produced by means which entail annoyances many times greater than the pleasures themselves. Thus pleasure as contemplated by Epicurus is not so much active enjoyment as the absence of pain.

Physics. The Epicurean doctrine of atoms and the void is derived directly from that of Democritus. The universe is said to consist of bodies and the space (void) in which they move. Bodies are either compound or the elements of which greater bodies are compounded. These elements are indivisible (*atoma*, atoms) and unchangeable. The number of atoms, the extent of the void, and the universe itself are all regarded as infinite.

The atoms vary in size but are not of all sizes; otherwise some would be visible. They are in perpetual motion, moving all with the same velocity, swift as thought. Because of an inherent "swerve" (this, of course, is a necessary postulate) the atoms collide and rebound to a lesser or greater distance, thus forming compound bodies of greater or lesser density.

Psychology. According to Epicurus, the soul is a material body of fine parts and is distributed through the whole bodily structure. So long as it is protected by the body, it is capable of sensation and of communicating sensation to the body. When it leaves the body, it is dissipated; the body, on the other hand, is no longer capable of sensation.

Sensory perception is a purely material process. From the surface of all bodies there are continually being discharged images, hollow films of exceedingly fine texture, which in shape are exact replicas of the bodies. Sensation of such images is the sole source of knowledge, and all sensuous perceptions are true. Error can arise only when, beyond what is given in sensation, the mind forms an opinion that is afterward contradicted or unconfirmed.

Theology. Epicurus holds that there can be no life to come, since the soul is of such a nature as to be dissolved immediately on leaving the body into the primordial atoms of which it was compounded; thus, death is not to be feared. As for fear of the gods, it too can be avoided through adopting the true teachings of philosophical theology. Epicurus does not deny the existence of the gods: rather he holds that "their existence is known to us by immediate apprehension." Fashioned of finer stuff than humankind, they dwell afar in the intermundial spaces, neither troubling human affairs nor troubled by them. The more one is at peace to receive the images emanating from the gods, the more easily will one win participation in the serenity of the heavenly beings.

Epicurus (b. 341 BC, Samos, Greece—d. 270, Athens), Greek philosopher, author of an ethical philosophy of simple pleasure, friendship, and retirement. He founded schools of philosophy that survived directly from the 4th century BC until the 4th century AD.

Early life and training. Epicurus was born on the island of Samos of Athenian parents who had gone there as military settlers. His father, a schoolteacher, was named Neocles, his

mother Chairestrate; both were of the same village, the deme Gargettos. According to his own report, Epicurus began his study of philosophy at the age of 14. One account has

Epicurus, bronze bust from a Greek original, c. 280–270 BC; in the Museo Archeologico Nazionale, Naples

By courtesy of the Soprintendenza alle Antichità della Campania, Naples

him turning to philosophy when his schoolmaster could not explain the concept of chaos in Hesiod, an early Greek philosophical poet. His first master is said to have been the Platonist Pamphilus of Samos. Much more significant, however, is the report that Epicurus was for three years (327–324) a student in the Ionian city of Teos, where his teacher was Nausiphanes, a disciple of the naturalistic philosopher Democritus. It may have been from this source that Epicurus' atomistic theory came, which he used not as a means of studying physics but as the basis for a philosophical system that ultimately sought ethical ends.

At the age of 18, Epicurus went to Athens to perform the two years of military training required for Athenian citizenship. While there he may have heard Xenocrates, second in succession after Plato as head of his Academy, and Aristotle, who was then in Athens. One year later Epicurus rejoined his parents at Colophon, where they had gone as exiles when, at the close of the Lamian War, Athens lost Samos to the Macedonians. For the next 10 years, there is virtually no record. It seems probable that Epicurus travelled and studied, and it is reasonable to suppose that this was the period during which he developed his philosophical outlook and confirmed it in exchanges with the Platonists and Aristotelians. A letter written by him from Teos, addressed to his mother, was preserved by Diogenes of Oenoanda. At the age of 32, Epicurus began to teach, first at Mytilene and subsequently at Lampsacus, a period that lasted from 311/310 to 307/306.

In various places Epicurus met the disciples who were destined to follow him to Athens and to become of great significance as vehicles through whom the Epicurean school would achieve its mature development: at Mytilene, he met his first disciple, Hermarchus, who eventually succeeded him as head of the Athenian school; and at Lampsacus, he met Metrodorus and Polyaeus, whose death preceded the master's and whose sons Epicurus provided for in his will; Metrodorus' brother, Timocrates; Leonteus and his wife, Themista, who had been a hetaera (an independent courtesan); Colotes, whom Epicurus flattered with the pet name Colotarian; and Idomeneus and his wife, Batis, sister of Metrodorus.

Thus, apart from his two years in Athens, Epicurus spent the first 35 years of his life in Asia. This need not mean, however, that he

developed an aversion to the literary circles in Athens. Instead, his Asiatic ties, which he continued to cultivate intensely all his life (including two or three actual journeys to Asia Minor) seem to have been reflected mainly in his choice of words and style and, more significantly, in the ecumenical scope of his philosophy.

The schools at Athens and elsewhere. When Epicurus and his followers came to Athens in 306, he bought a house and, in the garden, established a school, which came to be known as Ho Kepos (The Garden). At this time in Athens, cultural life was dominated by the Academy of Plato and the Lyceum of Aristotle, both of which had passed into the hands of successors. These schools attracted both the best theoretical students and those concerned with the application of philosophy to politics and public life. Therefore, any school that hoped to endure through this period had to enter into direct rivalry with the Academy and the Lyceum by establishing itself—as did the Stoa a few years later—in the city of Athens.

What Epicurus brought to Athens was more a way of life than a school or a community. Unlike both of the famous schools, it admitted women, and even one of Epicurus' slaves, named Mouse. It taught the avoidance of political activity and of public life, although, when one follower from a school outside Athens rose to political power and then fell, he was succoured by the school. Quite different from the usual connotations borne by the term epicurean today, life in the house and garden was simple. Water was the usual drink, although a half-pint daily ration of wine was allowed, and barley bread was eaten. During a famine Epicurus saved his students by doling out a few numbered beans daily. There was no communal property, as was the case in Pythagorean schools. Whereas the relationships of the members of the school were not platonic, in either the contemporary or any later sense, there are only the attacks of Stoic opponents to support any idea of sexual irregularity. Epicurus wrote clearly but in no highly organized way. There was much correspondence with students in Athens and at other schools, some letters being concerned with doctrinal matters but many seeming to be merely social and friendly.

On the day in his 72nd year that Epicurus died painfully of prostatitis, he dictated an affectionate and touching letter to Idomeneus—probably intended, in fact, for all of his friends in Lampsacus—which displayed the spirit in which he had remained true to his philosophy of repose and serenity even in the throes of pain. Epicurus' will left the house, garden, and some funds to trustees of the school. Remaining funds were left to honour Epicurus' deceased family and to celebrate his birthday annually and his memory monthly. His slaves were freed, and provision was made that the daughter of Metrodorus should be wed to someone in the Athenian school, with the approval of Hermarchus.

Writings and assessment. Diogenes Laërtius described Epicurus as a most prolific writer and preserved three of his letters and the *Kyriai doxai* ("Principal Doctrines"). The three letters are (1) *To Herodotus*, dealing with physics; (2) *To Pythocles* (probably a disciple's abridgement), on meteorology; and (3) *To Menoecus*, on ethics and theology. The *Kyriai* consists of 40 short aphoristic statements. Another major source is the papyrus from the Casa dei Papiri discovered at Herculaneum (1752–54), which include not only parts of his great work *Peri physeōs* ("On Nature"), originally in 37 books, but also numerous fragments of correspondence with his friends.

Many of Epicurus' methods made him comparable to a religious figure. The breadth of his appeal in Rome during the 1st century BC is indicated by the fact that the poet-philosopher Lucretius based his work on Epicurus

(Lucretius in fact held Epicurus in reverential awe), by the references to his thought by the statesman-moralist Cicero, and by the detailing by the biographer Plutarch of how Cassius soothed the mind of Brutus with his Epicurean ideas. Epicurus' atomistic theory was revived in the 17th century by Pierre Gassendi, a French philosopher-scientist.

(C.D.)

Epidaurus, in ancient Greece, important commercial centre on the eastern coast of the Argolid in the northeastern Peloponnese; it is famed for its 4th-century-BC temple of Asclepius, the god of healing. Excavations of the sacred precinct reveal that it contained temples to Asclepius and Artemis, a theatre, stadium, gymnasiums, baths, a *tholos*, a hospital, and an *abaton*, an area where patients slept. Inscriptions record divine medical cures. Originally Ionic, Epidaurus became Doric under the influence of Argos, to which it owed religious allegiance; politically it remained independent.

epidemic, an occurrence of disease that is temporarily of high prevalence. An epidemic occurring over a wide geographical area is called a pandemic. The rise and decline in epidemic prevalence of an infectious disease is a probability phenomenon dependent upon transfer of an effective dose of the infectious agent from an infected individual to a susceptible one. After an epidemic has subsided, the affected host population contains a sufficiently small proportion of susceptible individuals that reintroduction of the infection will not result in a new epidemic. Since the parasite population cannot reproduce itself in such a host population, the host population as a whole is immune to the epidemic disease, a phenomenon termed herd immunity.

Following an epidemic, however, the host population tends to revert to a condition of susceptibility because of: (1) the deterioration of individual immunity; (2) the removal of immune individuals by death; and (3) the influx of susceptible individuals by birth. In time the population as a whole again becomes susceptible. The time elapsing between successive epidemic peaks is variable and differs from one disease to another.

By the late 20th century the definition of epidemic had been extended to include outbreaks of any chronic disease (e.g., heart disease or cancer) influenced by the environment.

The term epidemic is sometimes reserved for disease among human beings; in such instances the term used for animals other than man is epizootic.

epidemic parotitis: see mumps.

epidemiology, branch of medical science that studies the distribution of disease in human populations and the factors determining that distribution, chiefly by the use of statistics. Unlike other medical disciplines, epidemiology concerns itself with groups of people rather than individual patients and is frequently retrospective, or historical, in nature. It developed out of the search for causes of human disease in the 19th century, and one of its chief functions remains the identification of populations at high risk for a given disease, so that the cause may be identified and preventive measures implemented.

Epidemiologic studies may be classified as descriptive or analytic. In descriptive epidemiology, demographic surveys are used to determine the nature of the population affected by the disorder in question, noting factors such as age, sex, ethnic group, and occupation among those afflicted. Other descriptive studies may follow the occurrence of a disease over several years to determine changes or variations in incidence or mortality; geographic variations may also be noted. Descriptive studies also help to identify new disease syndromes or

suggest previously unrecognized associations between risk factors and disease.

Analytic studies are conducted to test the conclusions drawn from descriptive surveys or laboratory observations. These studies divide a sample population into two or more groups, selected on the basis of suspected causal factor (for example, cigarette smoking) and then monitor differences in incidence, mortality, or other variables. One form of analytic study is the prospective-cohort study, in which members of a population are followed over time to observe differences in disease incidence.

In addition to providing clues to the causes of various diseases, epidemiologic studies are used to plan new health services, determining the incidence of various illnesses in the population to be served, and to evaluate the overall health status of a given population. In most countries of the world, public-health authorities regularly gather epidemiologic data on specific diseases and mortality rates in their populations.

Epidendrum, genus of tropical orchids, family Orchidaceae, with about 1,000 species that are distributed from southeastern North America to central South America. *Epidendrum* species are primarily epiphytic (supported by

Epidendrum ibaguense
A Z Botanical Collection—EB Inc

other plants and having aerial roots exposed to the humid atmosphere), but some grow on rocks or in soil. Flowers are usually borne on a terminal spike.

Some species have large pseudobulbs (swollen stems) with two or three leathery leaves; other species lack pseudobulbs and have long, thin stems. The only *Epidendrum* species native to nontropical North America is the greenfly orchid (*E. conopseum*), which has clusters of purplish-green flowers.

epidermal tooth, any of several hard, horny projections analogous to but not homologous with true teeth (*q.v.*). Epidermal teeth are found in the jawless fish (e.g., lampreys), on the edges of the jaws of tadpoles (larval frogs and toads), in the mouth of the platypus, where horny plates replace the true teeth before birth, and in sirenians (e.g., sea cows) accompanying true teeth.

epidermis, in zoology, protective outermost portion of the skin. There are two layers of epidermis, the living basal layer, which is next to the dermis, and the external stratum corneum, or horny layer, which is composed of dead, keratin-filled cells that have migrated outward from the basal layer. The melanocytes, responsible for skin colour, are found in the basal cells. The epidermis has no blood supply and depends on diffusion from the dermal cells for its metabolic needs. The dead-cell layer of the stratum corneum provides the protection from water loss that

allows vertebrates to dwell on land. Keratin, produced in migrating epidermal cells, forms the basis of nails, feathers, beaks, and other epidermal derivatives. In humans, epidermal fragments are constantly shed, but the "skin," or stratum corneum, of a snake is ordinarily shed all at once in a period of ecdysis.

epidermis, in botany, outermost, protoderm-derived layer of cells covering the stem, root, leaf, flower, fruit, and seed parts of a plant. The epidermis and its waxy cuticle provide a protective barrier against mechanical injury, water loss, and infection. Various modified epidermal cells regulate transpiration, increase water absorption, and secrete substances.

epididyme, either of a pair of elongated crescent-shaped structures attached to each of the two male reproductive organs, the testes (*see testis*). Sperm cells produced in the testes are transported to the epididymes, where they mature and are stored. Each epididymis has three regions, called, respectively, the head, body, and tail. The head is the uppermost and largest part of the epididymis; it lies on the top surface of the testis. The body is attached to the anal side of the testis and extends the length of the gland. The smallest region is the tail, which begins at the point of separation of the epididymis from the testis. Sperm cells mature primarily in the head and body of the epididymis and are stored in the tail.

The epididymis receives sperm from the tubules in the mediastinum testis, the region in the testis in which all its sperm-producing tubules converge and empty. Leading from the mediastinum to the head of the epididymis are 15–20 small, tightly coiled ducts called the ductuli efferentes. The cells lining the ductuli have pigiment granules, secretory granules, and cilia (hairlike structures). In the head region of the epididymis, all the ductuli efferentes connect to one large vessel, the ductus epididymidis. This duct is also extremely coiled, being about 4 to 5 m (13 to 16 feet) long when stretched out. The ductus epididymidis extends through both the body and the tail region of the epididymis. In the tail region it becomes thicker, less coiled, and larger in diameter. As it emerges from the end of the epididymis, it straightens out to form the ductus deferens (*q.v.*).

During ejaculation, sperm are propelled through the ductuli efferentes and ductus epididymidis in two ways. First, the muscle tissue, by contracting, narrows the ducts, propelling the sperm. Second, the cilia located in the ductuli efferentes can propel sperm by their continual swaying motions. As sperm pass through the various ducts, they acquire small amounts of fluids that help to keep them alive. These secretions include high concentrations of potassium, sodium, and a substance known as glycylphosphorylcholine, which is an energy source for sperm.

epidote, any of a group of colorless to green or yellow-green silicate minerals with the general chemical formula $A_2B_3(\text{SiO}_4)_3(\text{Si}_2\text{O}_7)\text{O}(\text{OH})$, in which *A* is usually calcium (Ca), though manganese (Mn) or cerium (Ce) is sometimes substituted; and *B* is generally aluminum (Al), with the main substitution being ferric iron (Fe^{+3}). Structurally the epidote group consists of chains of AlO_6 and $\text{Al}_4(\text{OH})_2$ octahedra linked by independent SiO_4 and Si_2O_7 groups. The *A* atoms are in eight-fold coordination between the chains. Members of the epidote group include epidote ($A = \text{Ca}$, $B = \text{Al, Fe}$); cli-

nozoisite ($A = \text{Ca}$, $B = \text{Al}$, monoclinic); zoisite ($A = \text{Ca}$, $B = \text{Al}$, orthorhombic); piedmontite ($A = \text{Ca}$, $B = \text{Al, Mn, Fe}$); allanite ($A = \text{Ca, Mn, Ce}$, $B = \text{Fe, Al}$).

The epidote group occurs as secondary minerals in low-grade regionally metamorphosed rocks where its occurrence is used as an indicator of metamorphic grade. Members of the group are also produced during retrograde metamorphism of basic igneous rocks. In some cases, they may occur as a product of hydrothermal alteration of plagioclase feldspar. Manganese-rich piedmontite is as-

sociated with manganese deposits of metasomatic origin. For detailed physical properties, *see* silicate mineral (table).

epidote-amphibolite facies, one of the major divisions of the mineral-facies classification of metamorphic rocks, the rocks of which form under moderate temperature and pressure conditions (250°–400° C [500°–750° F] and up to 1 or 2 kilobars [1 kilobar equals about 15,000 pounds per square inch]). This facies grades into the greenschist facies under less intense metamorphic conditions and into the amphibolite facies with greater temperature and pressure. Minerals typical of the rocks of the epidote-amphibolite facies include biotite, almandite garnet, plagioclase, epidote, and amphibole. Chlorite, muscovite, staurolite, and chloritoid may also occur. Biotite, which can be identified easily, is used to identify the lower boundary of this facies; amphibole may also be used as an index mineral to identify the facies. Depending upon the composition of plagioclase, this facies may be subdivided into two subfacies, the albite-epidote-amphibolite subfacies and the oligoclase-epidote-amphibolite subfacies.

epigram, originally an inscription suitable for carving on a monument, but since the time of the Greek Anthology (*q.v.*) applied to any brief and pithy verse, particularly if astringent and purporting to point a moral. By extension the term is also applied to any striking sentence in a novel, play, poem, or conversation that appears to express a succinct truth, usually in the form of a generalization. Catullus (c. 84–c. 54 bc) originated the Latin epigram, and it was given final form by Martial (AD 40–103) in some 1,500 pungent and often indecent verses that served as models for French and English epigrammatists of the 17th and 18th centuries.

The epigram was revived by Renaissance scholars and poets, such as the French poet Clément Marot, who wrote epigrams in both Latin and the vernacular. In England the form took shape somewhat later, notably in the hands of Ben Jonson and his followers, among whom was Robert Herrick, writer of such graceful examples as the following:

I saw a Flie within a Beade
Of Amber cleanly buried:
The Urne was little, but the room
More rich than *Cleopatra's* Tombe.

As the century progressed, the epigram became more astringent and closer to Martial

in both England and France. The *Maximes* (1665) of François VI, Duke de La Rochefoucauld marked one of the high points of the epigram in French, influencing such later practitioners as Voltaire. In England, John Dryden, Alexander Pope, and Jonathan Swift produced some of the most memorable epigrams of their time.

Samuel Taylor Coleridge (1772–1834), writing at the beginning of the 19th century, produced an epigram that neatly sums up the form:

What is an Epigram? A dwarfish whole,
Its body brevity, and wit its soul.

The *Sinngedicht*, or sententious epigram, engaged German taste in the 18th and early 19th centuries, culminating in J.W. von Goethe's *Zahme Xenien* (1820; "Gentle Epigrams"). Among the more recent masters of the English epigram were Oscar Wilde and George Bernard Shaw. Wilde became famous for such remarks as "A cynic is a man who knows the price of everything and the value of nothing." Shaw, in his *Annajanska* (1919), commented that "All great truths begin as blasphemies."

epigraphy, the study of written matter recorded on hard or durable material. It is a prime tool in recovering much of the firsthand record of antiquity.

A brief treatment of epigraphy follows. For full treatment, *see* MACROPAEDIA: History, The Study of.

Epigraphy is the study of inscriptions from the earliest civilizations through the present day, their interpretation and their classification. Preserved in materials that range in durability from papyrus to stone, inscriptions are often the only surviving records of ancient historical events and of extinct cultures, their languages, and their systems of writing. Epigraphy attracted the interest of historians as early as Polybius (204–122 bc) and Thucydides, and the renewed study that was begun during the Renaissance has culminated in comprehensive editions by modern scholars that gather inscriptions from virtually every major source.

Epigraphs are classified as either monumental, those intended for preservation; archival, those intended as records; and incidental, as in graffiti. Because present techniques of historiography are of relatively late origin, inscriptions of all three types are frequently invaluable in separating historical fact and chronology from the personal and legendary accounts of other written documents.

Inscriptions from ancient Mesopotamia show the processes of cultural evolution from the earliest Sumerian communities through the later periods of Assyrian and Babylonian domination. From the Sumerians, surviving documents include a chronology of kings, legendary songs that supplied the traditional material for the Akkadian *Epic of Gilgamesh*, and a number of prayers, proverbs, prophecies, and other ritual and literary texts. Other inscriptions from this region include records of commercial transactions and legal proceedings, and the monumental legal code on the stela of Hammurabi, dating from about 1750 bc.

Cuneiform Akkadian inscriptions are also important as the primary international medium of writing during the most crucial epochs of Egyptian civilization. The bulk of Egyptian epigraphy consists of personalized historical accounts, of which many survive from as early as the 4th dynasty (2613–2494 bc). These documents became increasingly prominent during the large-scale expansionist campaigns of the 18th dynasty, and their eventual decline parallels Egypt's replacement as a major power by the kingdoms of Babylonia and Assyria. Extant religious texts consist of detailed records of dramatic ritual, ceremonies for the dead, and numerous prophetic and magical writings. Narratives of the creation

myths of Atum and Ptah, hymns to the gods, and amatory and other secular lyrics are also preserved in inscriptions.

Elsewhere in the ancient Middle East, historical inscriptions are plentiful from the height of the Hittite Empire (preserved at Boğazköy in Asia Minor), and the period following the decline of the Hittites can be traced through later Syrian and Palestinian inscriptions, which also mark the replacement of cuneiform with Hittite and Semitic systems of writing. Persian epigraphs from the Achaemenian Empire of the 6th century BC that survive in several different languages are of particular value for linguistic analysis and for comparison with Greek historical accounts of the same era.

An important body of epigraphs also survives from ancient India, though the absence of a linear conception of history and the mixture of legend and myth make them unreliable as historical documents. However, Aśoka's reign over most of India, beginning in the 3rd century BC, has left inscriptions whose historicity is supported by references to foreign political events of known date. The historicity of Chinese inscriptions from roughly the 23rd century BC on has been established through comparisons with archaeological evidence and nonepigraphic documents. A strong Chinese influence is detectable through epigraphs from the Central Asian Turk dynasty of the 8th century AD.

The decipherment in 1952 of the long-undeciphered Minoan Linear B tablets has been widely accepted as evidence that the spoken language of Cretans and Mycenaeans during the 2nd millennium BC was a form of Greek. (Some authorities reject the decipherment of the tablets as Greek.) Though these Linear B inscriptions consist primarily of inventories, they supply direct evidence of social and economic structures and demonstrate the Mycenaean origin of classical Greek religion. The production of epigraphs in later Greece shows an increase that parallels the spread of literacy, though inscriptional historiography is minimal and is rivaled by a sophisticated literary tradition.

The epigraphs that have survived from the Roman Empire, though highly standardized, exhibit wide stylistic and linguistic variations. Besides Latin, they were commonly written in Greek and Oscan, and their extensive use of abbreviations and of Etruscan dialect often make interpretation problematic. Roman epigraphs of historical significance were not produced before the 2nd century BC; and, although that era has left important legal inscriptions, most Roman law was recorded in nonepigraphic media. More common are inscriptions that record ritual practices of religions, as well as epitaphs.

In northern Europe, where writing was a late development, inscriptions are few, though some of Celtic origin survive. Runic messages, carved in a Germanic alphabet or in one of its European derivatives and dating from about 200 BC, are often commemorative or dedicatory or take the form of epitaphs.

Because epigraphs are generally executed soon after the occasions they commemorate, the dating of the inscription itself through radiocarbon or stratigraphic analysis or through paleographic analysis of the script and style often provides a key to the chronology of historical events. In many instances they are the only available evidence, while in others they may help to reinforce or refute the assertions of ancient historiographers. Their records of extinct and obsolete languages are often crucial in tracing the origin, evolution, and migration of ancient cultural and linguistic families and in determining the relationships among them.

epilepsy, sudden and recurrent disturbances in mental function, state of consciousness, sensory activity, or movements of the body, caused by paroxysmal malfunction of cere-

bral nerve cells. Epilepsy includes generalized convulsions in which there is sudden unconsciousness with falling and shaking of limbs (grand mal; *q.v.*), momentary lapses of awareness (petit mal; *q.v.*), and local movements and sensations in parts of the body (focal seizure; *q.v.*), as well as other types of activity that may include bizarre automatic behaviour, strange memories, illusory and hallucinatory experiences, and changes in mood. Epilepsy is not a specific disease but rather a complex of symptoms that results from any of a number of conditions that excessively excite nerve cells of the brain. The terms cerebral seizure and convulsive disorder are synonymous with epilepsy.

Epilepsy is a relatively common disorder (estimated incidence: 0.5 percent of the population) that is slightly more prevalent among males than females (about 10:8). More than 70 percent of epileptic individuals have their first attack before age 20.

Type of seizures. The most frequently used nomenclature for the categories of epilepsy are grand mal, petit mal, psychomotor, infantile spasms, and epileptic equivalents; but many epileptic individuals exhibit more than one type. Neurologists attempt to classify each case of epilepsy in three ways: clinical patterns, originating locus in the brain, and cause of the disorder in brain function.

The forms of epilepsy that appear to involve all or most of the brain at once are generalized convulsions without focal onset (originating in a specific area of the brain), short absences of consciousness, massive spasms in infancy and early childhood, generalized muscle jerks, and loss of muscle tone, with falling. Seizures that originate in local areas of the brain and may spread are of six main types: focal motor, focal sensory, psychomotor, aphasic, visceral, and psychical seizures. In more than 50 percent of persons with generalized convulsions, there is some evidence of a beginning in a local area. Focal onset may be manifested by localized movements or sensations of a part of the body or by subjectively experienced warnings, called auras, that last from a fraction of a second to a few seconds. Auras arising from specific areas of the brain include illusions that the environment is strangely familiar, auditory or visual hallucinations, ringing in the ears, and unpleasant odours or tastes. Although part of the seizure proper, auras are considered warnings of an impending attack.

Diagnosis. A person with recurrent seizures is considered to have epilepsy. Diagnosis is based on the clinical description of recurring episodes of changes in consciousness and involuntary movements. It is important to determine whether a curable condition is responsible. A complete history, general physical and neurological examination, and certain laboratory studies are required. X rays of the skull and studies of the blood and spinal fluid are often needed. Both the electroencephalogram and echoencephalogram help to confirm the diagnosis, locate the site, and assist in discovering the cause of the attack.

Other methods used in the search for brain lesions responsible for seizures include brain-scanning with radioisotopes, cerebral angiography, and pneumoencephalography.

Treatment. Some of the causes of seizures can be treated; these include some brain tumours, infections, metabolic and endocrine abnormalities, and the formation of epileptogenic brain tissue as a result of trauma. Surgical removal of epileptiform brain tissue is indicated in a limited number of individuals, particularly those in whom the lesions are contained in a single, surgically accessible area. In most epileptic individuals, however, the brain damage cannot be reversed, and the control of seizures will depend on attempts at prevention of attacks by medicinal means and the handling of problems of social adjustment. The most effective treatment is anticonvulsant

medication. Approximately 20 useful anticonvulsants are available. It is usually necessary to continue medication for several years after seizures are fully controlled.

Epilepsy in domestic animals. Epilepsy occurs in many animals, most often in the dog, especially in highly inbred breeds. Convulsions usually appear in the second year. A predisposition to epilepsy is apparently inherited. The illness may become chronic and controllable with drugs, or the brain may be gradually destroyed and treatment unavailing. Canine hysteria, or psychomotor epilepsy, is characterized by longer seizures of fright, restlessness, and barking and running fits.

Epilobium, genus of about 200 plants, in the evening primrose family (Onagraceae), native to most temperate regions. It includes fireweed (*q.v.*; species *E. angustifolium*), which rapidly covers newly burned areas. The young parts of some species can be cooked and eaten as potherbs. The plants are sometimes cultivated but must be carefully confined.

Flower of *Epilobium angustifolium*
Rutherford Platt

The hairy willow herb, or codling-and-cream (*E. hirsutum*), up to 2 m (6 feet) high, is similar to fireweed but has hairy leaves and stalks and notched flower petals; it is found in waste places in eastern North America. Rock fringe (*E. obcordatum*) is a prostrate form from the western United States; it has rose-purple flowers. Two alpine species are *E. alsinifolium* and *E. fleischeri*, with almost needlelike leaves and purplish red or rose-red flower spikes. *E. nummularifolium*, from New Zealand, has whitish flowers and brownish red leaves; it is grown in rock gardens for its attractive matlike growth. *E. montanum*, with pale pink flowers, is found in temperate-zone woods.

epilogue: see prologue and epilogue.

Epimenides (fl. 6th century BC?), Cretan seer, reputed author of religious and poetical writings. He conducted purificatory rites at Athens about 500 BC according to Plato (about 600 according to Aristotle). All surviving fragments, including a line quoted by St. Paul (Titus 1:12), are attributable to other sources. Stories of his advanced age (157 or 299 years), his miraculous sleep of 57 years, and his wanderings outside the body have led some scholars to regard him as a legendary figure of a shamanistic type.

Epimenides' paradox: see liar paradox.

Épinal, town, capital of the Vosges département, Lorraine région, eastern France, on the Moselle River, south-southeast of Nancy. The town, located on two arms of the Moselle, is divided into four parts. The town proper, known as the *grande ville* ("large town"), or *vieille ville* ("old town"), stands on the right bank of the main river. The *petite ville* ("little town") is on an island between the two branches. On the left bank of the smaller branch, called the Canal des Grands Moulins, stands the Quartier de la Gare ("Station Quarter"), divided by the railway line from the Quartier de Chantraine to the west. The

town lies between forests to the west and lush meadows to the east.

The Place des Vosges in the *grande ville* has preserved its ancient arcades and some old houses. Nearby stands the basilica of Saint-Maurice, parts of which date from the 11th century. The town originally developed around a 10th-century monastery. It passed to Charles VII, king of France from 1422 to 1461, and was then ceded to the dukes of Lorraine in 1465. It was incorporated into France in 1766. The town became famous in the 18th and 19th centuries for making coloured picture prints, and the museum houses a collection of them. In the 20th century Épinal became a centre for the manufacture of cotton goods, rubber, and synthetic fibres. Pop. (1982) 37,228.

Épiny, Louise-Florence-Pétronille Tardieu d'Esclavelles, dame de La Live d', by-name MADAME D'ÉPINAY (b. March 11, 1726, Valenciennes, Fr.—d. April 17, 1783, Paris), a distinguished figure in advanced literary circles in 18th-century France. Though she wrote

Mme d'Épiny, detail of a pastel by Jean Étienne Liotard, c. 1759; in the Musée d'Art et d'Histoire, Geneva

By courtesy of the Musée d'Art et d'Histoire, Geneva

a good deal herself, she is more famous for her friendships with three of the outstanding French writers and thinkers of her day, Denis Diderot, Baron Friedrich de Grimm, and Jean-Jacques Rousseau.

Mme d'Épiny interested herself in literature and the welfare of men of letters after the breakdown of her marriage to Denis-Joseph de La Live d'Épiny, a financier. She set up a congenial salon in her country house at La Chevrette, near Montmorency, and offered hospitality to the Philosophes, the leading intellectual figures of the period immediately prior to the French Revolution. Her friendship with Grimm was long and untroubled, and Mme d'Épiny collaborated with him on his famous correspondence. Her association with Rousseau, on the other hand, was brief and stormy: in 1756 he accepted her offer of accommodation in the "Hermitage," a small dwelling near her country house, and wrote his novel *La Nouvelle Héloïse* there. But then he quarreled with his hostess, and the two became implacable foes. Mme d'Épiny was the author of several novels and works on education, but her writings are of interest now chiefly for their autobiographical revelations.

Épiny-sur-Seine, town, northern suburb of Paris, Seine-Saint-Denis *département*, Paris region, north-central France, on the Seine River. Épiny originated from a Gallic-Roman settlement called Spinogelum (Place of Thorns and Gorse), and in the Middle Ages it was the site of La Brache, a castle of the Frankish kings. During the Franco-German War a battle was fought there (Nov. 30, 1870). The town has a chemical industry and film studios. Pop. (1982) 50,280.

epinephrine and norepinephrine, also called ADRENALINE and NORADRENALINE, two separate but related hormones secreted by the medulla of the adrenal glands (*q.v.*). They are also produced at the ends of sympathetic nerve fibres, where they serve as chemical mediators for conveying the nerve impulses to effector organs. Chemically, the two compounds differ only slightly; and they exert similar pharmacological actions, which resemble the effects of stimulation of the sympathetic nervous system. They are, therefore, classified as sympathomimetic agents. The active secretion of the adrenal medulla contains approximately 80 percent epinephrine and 20 percent norepinephrine; but this proportion is reversed in the sympathetic nerves, which contain predominantly norepinephrine.

The actions of epinephrine and norepinephrine are generally similar, although they differ from each other in certain of their effects. Norepinephrine constricts almost all blood vessels, while epinephrine causes constriction in many networks of minute blood vessels but dilates the blood vessels in the skeletal muscles and the liver. Both hormones increase the rate and force of contraction of the heart, thus increasing the output of blood from the heart and increasing the blood pressure. The hormones also have important metabolic actions. Epinephrine stimulates the breakdown of glycogen to glucose in the liver, which results in the raising of the level of blood sugar. Both hormones increase the level of circulating free fatty acids. The extra amounts of glucose and fatty acids can be used by the body as fuel in times of stress or danger where increased alertness or exertion is required. Epinephrine is sometimes called the emergency hormone because it is released during stress and its stimulatory effects fortify and prepare an animal for either "fight or flight."

The purified, active compounds are used clinically and are obtained from the adrenal glands of domesticated animals or prepared synthetically. Epinephrine may be injected into the hearts of victims of cardiac arrest to stimulate heart activity. It also dilates the bronchioles and in this way is an aid to respiration for asthma sufferers. Epinephrine is also useful in acute allergic disorders, such as drug reactions, hives, and hay fever. Norepinephrine is administered by intravenous infusion to combat the acute fall in blood pressure associated with certain types of shock. Norepinephrine is formed in the body from the amino acid tyrosine, and epinephrine is in turn formed from norepinephrine.

epinicion, also spelled EPINIKION, plural EPINICIA, or EPINIKIA, choral lyric ode honouring a victor in the great Hellenic games, performed as part of the celebration on his triumphal return to his city. The epinicion had a basis in improvised celebration, but the form as it has survived is highly literary. One of the earliest examples extant is that of Simonides of Ceos, an ode for an Olympic victory in 520 BC.

Though the epinicion's structure is not fixed, there is a certain uniformity in content and arrangement. The occasion demands a reference to the victor and the nature and place of his victory; to this may be added reference to victories of members of his family or a compliment to his trainer. Generally there is a myth, more or less elaborate and relevant to the occasion. There is also a gnomic element of wise sayings and reflections on life.

The epinicion ode did not use traditional lines or stanzas, but the metre was formed afresh for each poem and was never used again in exactly the same form. The strophes, or stanzas, either single or in systems of three, were repeated through the poem, and often their form was related to the accompanying dance. Its performance required a trained choir and musicians skilled in the lute and the

lyre. The form reached its zenith in the odes of Pindar (518 or 522 to after 446 BC). Those of his younger contemporary, Bacchylides, signaled the end of its popularity. *See also* ode.

Epiphanius OF CONSTANTIA, SAINT (b. c. 315, Palestine—d. May 403, at sea; feast day May 12), bishop noted in the history of the early Christian Church for his struggle against beliefs he considered heretical. His chief target was the teachings of Origen, a major theologian in the Eastern Church. The harsh attacks by Epiphanius, who considered Origen more a Greek philosopher than a Christian, did much to discredit Epiphanius' principles.

Epiphanius studied and practiced monasticism in Egypt and then returned to his native Palestine, where near Eleutheropolis he founded a monastery and became its superior. In 367 he was made bishop of Constantia (Salamis) in Cyprus. He spent the rest of his life in that post, spreading monasticism and campaigning against heretics. His orthodox views conflicted with those of the Roman emperor Valens, who governed in the East from 364 to 378 and who had embraced Arianism, but Epiphanius was protected by the veneration in which men held him for his sanctity.

In 403 Epiphanius went to Constantinople to campaign against the bishop there, St. John Chrysostom, who had been accused of sheltering four monks expelled from Alexandria for their Origenistic views. Becoming convinced of the falsity of this and related charges made by Bishop Theophilus of Alexandria (who wanted to depose John), Epiphanius set sail for Cyprus but died en route.

A zealous bishop and a revered ascetic, Epiphanius was lacking in moderation and judgment. These defects are reflected in his writings, of which the chief work is the *Panarion* (374–377), an account of 80 heresies including Greek philosophical schools, Jewish sects, and Samaritans; it ends with a statement of orthodox doctrine. His *Ancoratus* (374) is a compendium of the teachings of the church. His works are valuable as a source for the history of theological ideas.

Epiphany (from Greek *epiphaneia*, "manifestation"), festival celebrated on January 6; it is one of the three principal and oldest festival days of the Christian Church (including Easter and Christmas). It commemorates the first manifestation of Jesus Christ to the Gentiles, represented by the Magi, and the manifestation of his divinity, as it occurred at his Baptism in the Jordan River and at his first miracle at Cana in Galilee.

The festival originated in the Eastern Church, where it at first included a commemoration of Christ's birth. In Rome, by 354, Christ's birth was being celebrated on December 25, and later in the 4th century the church in Rome began celebrating Epiphany on January 6. In the Western Church the festival primarily commemorates the visit by the Magi to the infant Jesus. In the East it primarily commemorates the Baptism of Jesus.

In the West the evening preceding Epiphany is called Twelfth Night.

epiphyseal ischemic necrosis (disorder): *see* osteochondrosis.

epiphysis cerebri: *see* pineal gland.

epiphyte, any plant that grows upon or is in some manner attached to another plant or object merely for physical support. Epiphytes are primarily tropical in distribution and are often known as air plants because they have no attachment to the ground or other obvious nutrient source. They obtain water and minerals from rain and also from debris that collects on the supporting plants. Orchids, ferns, and members of the pineapple family are common tropical epiphytes. Lichens, mosses, liverworts, and algae are epiphytes of temperate regions. Mistletoes, which are partly parasitic

Epiphytes on limbs of jungle tree

Harrison Forman

on their host plants, are sometimes considered to be epiphytes.

Epirus, Modern Greek *ÉPIROS*, coastal region of northwestern Greece and southern Albania. It extends from Valona Bay (Gji i Vlorës) in Albania (northwest) to the Gulf of Arta (southeast); its hinterland extends eastward to the watershed of the Pindus Mountains. The *nomoi* (departments) of Arta, Ioánnina, Prêveza (*qq.v.*), and Thesprotia make up the Greek part of Epirus. The Pindus Mountains separate Epirus from the Greek regions of Macedonia and Thessaly to the east. The principal town in Greek Epirus is Ioánnina, and the largest settlement in Albanian Epirus is Gjirokastër.

Epirus is largely made up of great limestone ridges oriented northwest-southeast and north-south; they reach up to 8,600 feet (2,600 m) in height and fall off more steeply to the west. These ridges generally parallel the coast and are so steep that the valley land between them is mostly suitable only for pasture, though northern Epirus has more plains and cereal production. Much of Epirus lies on the windward side of the Pindus Mountains and hence receives the prevailing winds off the Ionian Sea, with the result that it receives more rainfall than does any other region of mainland Greece.

Poor-quality soils, faulty farming practices, and fragmented landholdings have kept the region's agricultural productivity low. Sheep and goats are raised, and corn (maize) is the chief crop. Olives and oranges are also cultivated, and tobacco is grown around Ioánnina. There is also some dairying and fishing. Wheat and vegetables must be imported.

Epirus has few resources and industries, and its population has been depleted by emigration. The population is concentrated in the area around Ioánnina, which has the largest number of manufacturing establishments.

In the Neolithic period Epirus was populated by seafarers along the coast and by shepherds and hunters from the southwestern Balkans who brought with them the Greek language. These people buried their leaders in large mounds containing shaft graves. Similar burial chambers were subsequently used by the Mycenaean civilization, suggesting that the founders of Mycenae may have come from Epirus and central Albania. Epirus itself remained culturally backward during this time, but Mycenaean remains have been found at two religious shrines of great antiquity in the region: the Oracle of the Dead on the Acheron River, familiar to the heroes of Homer's

Odyssey, and the Oracle of Zeus at Dodona, to whom Achilles prayed in the *Iliad*.

After the Mycenaean civilization declined, Epirus was the launching area of the Dorian invasions (1100–1000 bc) of Greece. The region's original inhabitants were driven southward by the Dorians, and out of the ensuing migrations three main clusters of Greek-speaking tribes emerged in Epirus: the Thesproti of southwestern Epirus, the Molossi of central Epirus, and the Chaones of northwestern Epirus. They lived in clusters of small villages, in contrast to most other Greeks, who lived in or around city-states.

In the 5th century Epirus was still on the periphery of the Greek world. To the 5th-century historian Thucydides, the Epirotes were "barbarians." The only Epirotes regarded as Greek were the Aeacidae, who were members of the Molossian royal house and claimed descent from Achilles. From about 370 bc on, the Aeacidae were able to expand the Molossian state by incorporating tribes from the rival groups in Epirus. The Aeacidae's efforts gained impetus from the marriage of Philip II of Macedon to their princess, Olympias. In 334, while Alexander the Great, son of Philip and Olympias, crossed into Asia, his uncle, the Molossian ruler Alexander, attacked southern Italy, where he was eventually checked by Rome and killed in battle in about 331. Upon Alexander the Molossian's death, the Epirote tribes formed a coalition on an equal basis but with the Molossian king in command of their military forces. The greatest Molossian king of this coalition was Pyrrhus (319–272); he and his son Alexander II ruled as far south as Acarnania and to central Albania in the north. Pyrrhus' military adventures overstrained his state's military resources, but they also brought great prosperity to Epirus. He built a magnificent stone theatre at Dodona and a new suburb at Ambracia (now Arta), which he made his capital.

After the Aeacid monarchy ended in 232, the Epirote alliance was transformed from a coalition of tribes into a federal state, the Epirote League, with a parliament (*synedrion*). The league steered an uneasy course during the conflicts between Rome and Macedonia, and in 170 bc, during the Third Macedonian War (171–168), the league split apart, the Molossians supporting Macedonia, the Chaones and Thesproti siding with Rome. Molossia was taken in 167 by victorious Rome, and 150,000 of its inhabitants were enslaved.

Central Epirus did not recover until the Byzantine period, but the coastal areas continued to prosper as part of a Roman province. When the Roman Empire split in ad 395, Epirus was the westernmost province of the Eastern Empire. When the Byzantine Empire became fragmented, an independent kingdom was maintained in Epirus (*see* Epirus, Despotate of) after 1204 ad, but in 1318 Serbs and Albanians overran the area, and in 1430 the Ottoman Turks annexed it. Under Turkish rule, the region suffered from overcultivation and deforestation that caused soil erosion and depopulation. In the 18th century Turkish sovereignty over Epirus was threatened by a Turko-Albanian despot, Ali Paşa Tepelenë, who was recognized in 1778 by Turkey as pasha of Ioánnina. His oppressive rule was extended by 1810 to most of the Peloponnese, central Greece, and parts of western Macedonia and was a leading cause of the War of Greek Independence (1821–29).

Much of northern Epirus was united with Greece in 1913, leaving minorities on both sides of the Greek-Albanian frontier. In 1939 Italy annexed all of Albania but in 1940, after attempting to invade Greece, was pushed out of Greek Epirus by the Greek army and lost much of northern Epirus until the German attack on Greece. The German occupation followed (1940–44) until the Allies restored the Greek-Albanian frontier.

Epirus, Despotate of (1204–1337), Byzantine principality in the Balkans that was a centre of resistance for Byzantine Greeks during the western European occupation of Constantinople (1204–61).

The despotate was founded in what is now southern Albania and northwestern Greece by Michael Angelus Ducas, a member of the dethroned Byzantine imperial house. His half brother and successor, Theodore Ducas, extended his rule eastward to Thessalonica in 1222 and claimed the title of Byzantine emperor.

Theodore's rivals, John III Vatatzes, emperor of Nicaea, and John Asen II of Bulgaria, attacked him from the east and north; John Asen II defeated and captured Theodore in 1230 at the Battle of Klokotnitsa (now in Bulgaria).

Under Michael II (reigned 1236–71), Epirus was greatly reduced, and in 1264 Michael was forced to recognize the suzerainty of Michael VIII Palaeologus, who had expelled the Latins from Constantinople and restored the Byzantine Empire.

In the 13th century Epirus promoted a revival of classical studies that contributed to the development of Renaissance Italy. The principality was reannexed to the Byzantine Empire in 1337.

episcopacy, in some Christian churches, the office of a bishop and the system of church government based on the three orders, or offices, of the ministry: bishops, priests, and deacons. The origins of episcopacy are obscure, but by the 2nd century ad it was becoming established in the main centres of Christianity. It was closely tied to the idea of apostolic succession, the belief that bishops can trace their office in a direct, uninterrupted line back to the Apostles of Jesus.

A 2nd-century bishop was charged with the spiritual welfare of his congregation; he was the chief liturgical minister, and he baptized, celebrated the Eucharist, ordained, absolved, controlled finances, and settled matters of dispute. With state recognition of Christianity in the 4th century, the bishop came to be regarded not only as a church leader but also as an important figure in secular affairs.

As the bishops' duties increased and congregations grew in size and number, it became necessary either to have more bishops or to delegate some of their functions to others. Congregations in an area (diocese) were entrusted to presbyters (priests), assisted by deacons, under the supervision of a bishop. It was this system of church government that became established throughout the church. The bishop retained as his exclusive right the power to confirm church members, ordain priests, and consecrate other bishops.

As the Middle Ages advanced, the system of delegation of duties became excessively organized, and an ecclesiastical bureaucracy came into being. A complex hierarchy of subordinate officials acted on the bishop's behalf. Although bishops made important contributions to the medieval state, this activity interfered with the office of church leader.

During the Reformation in the 16th century, episcopacy was repudiated by many Protestant churches, partly on the grounds of its corruption but also because many believed the system was not based on the New Testament. The Roman Catholic, Eastern Orthodox, Anglican, Old Catholic, Swedish Lutheran, and some other churches have the episcopal form of church government. Abuses of the system that developed during the medieval period were eliminated after the Reformation.

In the 20th-century ecumenical movement, episcopacy has been problematic for churches seeking reunion. Some maintain its necessity

to the church, others think it beneficial to the church, and still others consider it neither necessary nor beneficial. Most Christians agree that *episkopos* in its original Greek sense of "overseer" is essential to the church, but they differ as to the functions of the overseer. See also ministry; bishop.

Episcopal Church: see Protestant Episcopal Church.

Episcopal Church in Scotland, independent church within the Anglican Communion that developed in Scotland out of the 16th-century Protestant Reformation.

The development of Protestantism in Scotland went through confusing periods, with control alternating between the Presbyterian Party (those who believed in the presbyterian form of church government) and the Episcopal Party (those who believed the church should be governed by bishops). After the Restoration of the monarchy in 1660, the two parties merged into a modified episcopacy, which might have united the church and nation if the two parties had not again separated after the accession of William and Mary (1689). Since the Episcopalians had taken an oath of allegiance to King James II, they felt they could not in good conscience transfer their allegiance to William and Mary when James was deposed. Thus, Presbyterianism was established as the national religion (1690) of Scotland. The Episcopal Church in Scotland is the direct descendant of those churches that remained loyal to the episcopal tradition, and its bishops are the direct successors of those consecrated to Scottish sees after the Restoration.

In the 18th century the Episcopal Church in Scotland suffered because of involvement in the rebellions of 1715 and 1745 of the Jacobites (those who remained loyal to James II, the exiled Stuart king, and his heirs). Penal laws against the church almost eliminated it. Repeal of the laws in 1792 marked a turning point, and the church began to revive. It subsequently supported foreign missions, especially in South Africa and India, and social-welfare work at home.

The Scottish Communion Office, based on the liturgy in the service book imposed on Scotland by Charles I in 1637, was prepared in 1764. In the 1920s a revision of the entire prayer book was begun, and the complete Scottish prayer book was produced in 1929. This was essentially a revision of the English *Book of Common Prayer* of 1662.

The church is divided into seven dioceses, each headed by a bishop. The seven bishops elect one of their number as primus (presiding bishop). Lay members take an active part in the church through the Representative Church Council, which handles financial matters, and through the Provincial Synod, authorized in 1961 and presided over by the presiding bishop, which considers liturgical and canonical matters.

Episcopius, Simon, also called SIMON BISCHOP, BISCHOP, or BISSCHOP (b. Jan. 8, 1583, Amsterdam, Dutch Republic [now in The Netherlands]—d. April 4, 1643, Amsterdam), Dutch theologian and systematizer of Arminianism, a liberal reaction to the Calvinist doctrine of predestination.

He studied theology at Leiden and in 1610 became a pastor at Bleiswyk. He was made a professor at Leiden in 1612, succeeding the strict Calvinist Franciscus Gomarus. Episcopius was one of the Remonstrants, who placed more emphasis on freedom of the will than orthodox Calvinism allowed. With 12 others he was banished from the Netherlands after the Synod of Dort (1618–19) and lived in Paris, Antwerp, and Rouen until 1626. In 1634

he became head of the Remonstrant seminary in Amsterdam. In his *Institutiones theologicae* (1650–51), he attempted to provide a systematic basis for Remonstrant doctrine, asserting that God's sovereignty and man's free will are compatible.

episcopus vagans, plural EPISCOPI VAGANTES, in Christianity, a bishop without authority or without recognition in any major Christian church. Such bishops may have been properly consecrated but were not assigned to a diocese or were deprived of their diocese for some reason or were excommunicated by their church; or they may have received an irregular consecration by another bishop.

In the early Christian church, wandering bishops were a problem, primarily because some bishops were consecrated but were not given jurisdiction over a diocese. In addition, theological controversies in the 4th and 5th centuries often resulted in bishops being deprived of their sees; they retained their consecration as bishops but had to wander to make a livelihood. In later times, the number of *episcopi vagantes* was increased by bishops driven out of their dioceses by war, especially in Spain, or by bishops consecrated for dioceses controlled by Muslims who would not allow Christian bishops to take up residence. The activities of *episcopi vagantes* were not restricted in the Roman Catholic church until after the Council of Trent (1545–63).

In modern times, however, many *episcopi vagantes* have appeared who are outside the control of any ecclesiastical authority. Most of these wandering bishops trace their succession to one of three men consecrated in the late 19th and early 20th centuries. The first of these was Jules Ferrette, a former Roman Catholic priest who was consecrated in 1866 by the Jacobite bishop of Homs (Emesa) in Syria; he worked in England and the United States. Joseph René Vilatte, a lapsed French Catholic who had worked in the Protestant Episcopal Church in Wisconsin, was consecrated in 1892 by the Metropolitan of the Independent Catholic Church of Ceylon, Goa, and India; he worked in the United States. Arnold Harris Mathew, a former Roman Catholic priest, was consecrated in 1908 in Utrecht, Neth., by Old Catholic bishops. His consecration was later described as having been obtained by misrepresentation, and he was repudiated by the Old Catholics. He tried unsuccessfully to create an Old Catholic movement in England.

episome, in bacteria, one of a group of extrachromosomal genetic elements called plasmids, consisting of deoxyribonucleic acid (DNA) and capable of conferring a selective advantage upon the bacteria in which they occur. Episomes may be attached to the bacterial cell membrane (such a cell is designated F⁺) or become integrated into the chromosome (such a cell is designated Hfr). F⁺ and Hfr cells act like males during conjugation, a mating process in certain bacteria (e.g., *Escherichia*, *Salmonella*, *Serratia*, *Pseudomonas*). During conjugation, cells lacking the episome (called F⁻ cells) may receive either the episome (from an F⁺ cell) or the episome plus the genes to which it is attached (from an Hfr cell). Experiments involving gene transfers from Hfr cells have been used to determine the locations of genes on the chromosome of Hfr cells.

Some bacterial viruses, called temperate phages, carry DNA that can act as an episome. A bacterial cell into whose chromosome the viral DNA has become integrated is called a prophage. See lysogeny.

epistaxis (medicine): see nosebleed.

epistemology, the study of the origin, nature, and limits of human knowledge. The name is derived from the Greek words *epistēmē* ("knowledge") and *logos* ("reason"). Epistemology has had a long history spanning the time of the pre-Socratic Greeks up to the

present. Along with metaphysics, logic, and ethics, it is one of the four main fields of philosophy, and nearly every great philosopher has contributed to the literature on this topic.

A brief treatment of epistemology follows. For full treatment, see MACROPAEDIA: Epistemology.

The major issue with respect to the origins of knowledge is whether all knowledge is derived from experience. There are two sharply opposed traditions: empiricism, which affirms this view, and rationalism, which rejects it. Rationalists believe there are innate ideas (i.e., concepts man has independent of experience), such as the notion of equality, which are not found in experience. Some rationalists contend that these notions derive from the structure of the human mind, others that they exist independently of the mind and are apprehended by the mind when it reaches a certain degree of sophistication. Empiricists, by contrast, deny that there are any concepts that exist prior to experience, and accordingly they assert that all knowledge is a product of human learning in which perception plays the main role. Perception itself is problematic, however, since visual illusions and hallucinations show that perception cannot always depict the world as it actually is. Another problem for empiricists is the status of mathematical theorems whose truth conditions do not depend on experience and seem to be known a priori (i.e., prior to experience). The empiricist response to this claim is that mathematical theorems are empty of cognitive content and merely express the relationship of certain concepts to one another.

The greater achievement of the 18th-century German philosopher Immanuel Kant was to have worked out a compromise between these competing views. He argued that human beings do have knowledge that is prior to experience and yet is not devoid of cognitive significance, the principle of causality being one such example. Kant's view can be summarized in the maxim that there are a priori synthetic concepts.

The issues about the origins of knowledge are connected with questions about its limits. Many empiricists, such as David Hume, and nonempiricists, such as Kant, agree that the human mind has the capacity to generate questions that no possible appeal to experience could answer, such as whether there is a God, whether the world has a first cause or is uncaused, and whether there is a reality behind that apprehended by the senses. Kant labeled such questions transcendental (i.e., going beyond the limits of rational inquiry), and in the 20th century, so-called logical positivists, such as Moritz Schlick, Rudolf Carnap, and A.J. Ayer, have declared such questions to be metaphysical and devoid of cognitive significance.

Questions about the nature of knowing span a wide range, including inquiries as to whether knowledge is a type of belief or is different from belief, and whether knowledge is a special faculty in the mind or is a disposition to act in certain ways. There is some measure of agreement in dealing with such questions. Thus it is generally accepted that any analysis of knowledge must satisfy the conditions that if a person A can truly be said to know that *p*, where *p* is a proposition, *p* must be true, and A cannot be mistaken. This characterization connects knowledge with certitude and thus with issues raised by ancient and modern Skeptics, such as whether a person can achieve certitude about the world, about the past, about the mind of another person, or about oneself.

epistilbite, hydrated sodium and calcium aluminosilicate mineral in the zeolite family. It forms piezoelectric crystals of monoclinic symmetry and platy habit; the latter property has caused epistilbite to be assigned to a

group typified by heulandite (*q.v.*). More recently, X-ray diffraction studies have shown that the three-dimensional structure of epistilbite's aluminosilicate framework has features in common with that of mordenite (*q.v.*), which forms equant crystals. The chemical composition of the crystallographic unit cell (the smallest repeated component of the three-dimensionally lattice) of epistilbite is approximately $(\text{Ca}, \text{Na}_2)_4\text{Al}_6\text{Si}_{16}\text{O}_{48} \cdot 16\text{H}_2\text{O}$. Isolated specimens of the mineral have been found in New York, on the island of Jersey, and—with other zeolites—in Hawaii.

epistolary novel, a novel told through the medium of letters written by one or more of the characters. Originating with Samuel Richardson's *Pamela; or, Virtue Rewarded* (1740), the story of a servant girl's victorious struggle against her master's attempts to seduce her, it was one of the earliest forms of novel to be developed and remained one of the most popular up to the 19th century. The epistolary novel's reliance on subjective points of view makes it the forerunner of the modern psychological novel.

The advantages of the novel in letter form are that it presents an intimate view of the character's thoughts and feelings without interference from the author and that it conveys the shape of events to come with dramatic immediacy. Also, the presentation of events from several points of view lends the story dimension and verisimilitude. Though the method was most often a vehicle for sentimental novels, it was not limited to them. Of the outstanding examples of the form, Richardson's *Clarissa* (1748) has tragic intensity, Tobias Smollett's *Humphry Clinker* (1771) is a picaresque comedy and social commentary, and Fanny Burney's *Evelina* (1778) is a novel of manners. Jean-Jacques Rousseau used the form as a vehicle for his ideas on marriage and education in *La Nouvelle Héloïse* (1761; "The New Eloise"), and J.W. von Goethe used it for his statement of Romantic despair, *Die Leiden des jungen Werthers* (1774; *The Sorrows of Young Werther*). The letter novel of Pierre Choderlos de Laclos, *Les Liaisons dangereuses* (1782; *Dangerous Acquaintances*), is a work of penetrating and realistic psychology.

Some disadvantages of the form were apparent from the outset. The servant girl Pamela's remarkable literary powers and her propensity for writing on all occasions were cruelly burlesqued in Henry Fielding's *Shamela* (1741), which pictures his heroine in bed scribbling, "I hear him coming in at the Door," as her seducer enters the room. From 1800 on, the popularity of the form declined, though novels combining letters with journals and narrative were still common. In the 20th century letter fiction was often used to exploit the linguistic humour and unimentional character revelations of such semiliterates as the hero of Ring Lardner's *You Know Me Al* (1916).

epitaph, an inscription in verse or prose upon a tomb; and, by extension, anything written as if to be inscribed on a tomb. Probably the earliest surviving are those of the ancient Egyptians, written on the sarcophagi and coffins. Ancient Greek epitaphs are often of literary interest, deep and tender in feeling, rich and varied in expression, and epigrammatic in form. They are usually in elegiac verse, though many of the later epitaphs are in prose.

Among the most familiar epitaphs are those, ascribed to Simonides of Ceos (c. 556–468 BC), on the heroes of Thermopylae, the most famous of which has been translated thus:

Go tell the Spartans, thou that passest by
That here, obedient to their laws, we lie.

Roman epitaphs, in contrast to the Greek, contained as a rule nothing beyond a record of facts with little variation. An inscription commonly found is "may the earth lie light upon thee." A satiric inversion of this is seen

in the epitaph by Abel Evans (1679–1737) on the English architect Sir John Vanbrugh:

Lie heavy on him, Earth! for he
Laid many heavy loads on thee.

Many Roman epitaphs included a denunciation on any who should violate the sepulchre; a similar later denunciation is found on William Shakespeare's tomb:

Good friend, for Jesus's sake forbear
To dig the dust enclosed here;
Blest be the man that spares these stones,
And curst be he that moves my bones.

The oldest existing epitaphs in Britain are those of the Roman occupiers and are, of course, in Latin, which continued for many centuries to be the preferred language for epitaphs. The earliest epitaphs in English churches are usually a simple statement of name and rank, with the phrase *hic jacet* ("here lies"). In the 13th century, French came into use. The use of English began about the middle of the 14th century, but as late as 1776, Samuel Johnson, asked to write an English epitaph for Oliver Goldsmith, replied that he would never consent to disgrace the walls of Westminster Abbey with an English inscription. A familiar 18th-century epitaph was the one of 12 lines ending Thomas Gray's "An Elegy Written in a Country Church Yard." Perhaps the most-noted modern epitaph was that written by William Butler Yeats for himself in "Under Ben Bulbin":

Cast a cold eye
On life, on death,
Horseman, pass by!

Most of the epitaphs that have survived from before the Protestant Reformation were inscribed upon brasses. By Elizabethan times, however, epitaphs upon stone monuments, in English, became much more common and began to assume a more literary character. Thomas Nashe tells how, by the end of the 16th century, the writing of verse epitaphs had become a trade. Many of the best-known epitaphs are primarily literary memorials, not necessarily intended to be placed on a tomb. Among the finest are those by William Browne, Ben Jonson, Robert Herrick, John Milton, and Robert Louis Stevenson. Alexander Pope wrote several epitaphs; they inspired one of the few monographs on the subject—Samuel Johnson's examination of them in *The Universal Visitor* for May 1756.

Semiliteracy often produces epitaphs that are comic through grammatical accident—for example, "Erected to the memory of / John MacFarlane / Drowned in the Water of Leith / By a few affectionate friends." Far more common, though, are deliberately witty epitaphs, a type abounding in Britain and the United States in the form of acrostics, palindromes, riddles, and puns on names and professions. Benjamin Franklin's epitaph for himself plays on his trade as a printer, hoping that he will "appear once more in a new and more beautiful edition, corrected and amended by the Author"; and that of the antiquary Thomas Fuller has the inscription "Fuller's Earth."

The epitaph was also seen as an opportunity for epigrammatic satire, as in the Earl of Rochester's lines on Charles II: "He never said a foolish thing / Nor ever did a wise one."

The art of the epitaph was largely lost in the 20th century. Some notable examples of humorous epitaphs were suggested, however, by the 20th-century writer Dorothy Parker; they include "I told you I was sick" and "If you can read this, you're standing too close."

epitaxy, the process of growing a crystal of a particular orientation on top of another crystal, where the orientation is determined by the underlying crystal. The creation of various layers in semiconductor wafers, such as those used in integrated circuits, is a typical application for the process. In addition, epitaxy is often used to fabricate optoelectronic devices.

The word *epitaxy* derives from the Greek prefix *epi* meaning "upon" or "over" and *taxis* meaning "arrangement" or "order." The atoms in an epitaxial layer have a particular registry (or location) relative to the underlying crystal. The process results in the formation of crystalline thin films that may be of the same or different chemical composition and structure as the substrate and may be composed of only one or, through repeated depositions, many distinct layers. In homoepitaxy the growth layers are made up of the same material as the substrate, while in heteroepitaxy the growth layers are of a material different from the substrate. The commercial importance of epitaxy comes mostly from its use in the growth of semiconductor materials for forming layers and quantum wells in electronic and photonic devices—for example, in computer and telecommunications applications.

epithalamium, also spelled EPITHALAMION, or EPITHALAMY, song or poem to the bride and bridegroom at their wedding. In ancient Greece, the singing of such songs was a traditional way of invoking good fortune on the marriage and often of indulging in ribaldry. By derivation, the epithalamium should be sung at the marriage chamber; but the word is also used for the song sung during the wedding procession, containing repeated invocations to Hymen (Hymenaeus), the Greek god of marriage. No special metre has been associated with the epithalamium either in antiquity or in modern times.

The earliest evidence for literary epithalamiums are the fragments from Sappho's seventh book (c. 600 BC). The earliest surviving Latin epithalamiums are three by Catullus (c. 84–c. 54 BC). In the most original, Catullus tried to fuse the native Fescennine verse (a jocular, often obscene form of sung dialogue sometimes used at wedding feasts) with the Greek form of marriage song.

Epithalamiums based on classical models were written during the Renaissance by Torquato Tasso in Italy and Pierre de Ronsard in France. Among English poets of the same period, Richard Crashaw, John Donne, Sir Philip Sidney, and Ben Jonson used the form. Edmund Spenser's *Epithalamion*, written for his second marriage in 1595, is considered by some critics to be the finest example of the form in English.

Anonymous 17th-century epithalamiums are extant. In the 19th century, epithalamiums were written by Gerard Manley Hopkins and Edmund Gosse; and in the 20th century, by Witter Bynner, A.E. Housman, and Dannie Abse. See also Fescennine verse.

epithelioma, an abnormal growth, or tumour, of the epithelium, the layer of tissue that covers the surfaces of the organs and other structures of the body. Epitheliomas can be benign or malignant (that is, cancerous), and there are various types depending on the types of epithelial cells affected. (Cancerous epitheliomas are known as carcinoma; *q.v.*) Common epitheliomas include basal cell carcinoma and squamous cell carcinoma, two types of skin cancer that involve the inner layers and scalelike outer cells of the skin, respectively; and parathyroid adenoma, a benign tumour of glandular tissue in the parathyroid gland.

epithelium, in anatomy, layer of cells closely bound to one another to form continuous sheets covering surfaces that may come into contact with foreign substances. Epithelium occurs in both plants and animals.

In animals, outgrowths or ingrowths from these surfaces form structures consisting largely or entirely of cells derived from the surface epithelium. In this way the central nervous system, the sensitive surfaces of spe-

cial sense organs, glands, hair, nails, and other structures all originate. The epithelial cells possess typical microscopical characteristics: the cell outline is clearly marked, and the nucleus large and spherical or ellipsoidal. The cytoplasm of the cell is usually large in amount and often contains large numbers of granules.

Epithelium may be protective, absorptive, or secretory. It may produce special outgrowths (hairs, nails, horns on animals), and manufacture chemical material (*e.g.*, keratin), in which case the whole cell becomes modified. In other instances it contains fat droplets, granules of various kinds, protein, mucin, watery granules, or glycogen. In a typical absorbing cell, granules of material are absorbed. A secreting cell forming specific substances stores them until they are utilized—*e.g.*, fat, in sebaceous and mammary glands; enzymes in salivary and gastric glands; and various excretory substances in the renal epithelium of the kidney.

The cells forming an epithelial membrane are of various types: columnar, cubical, squamous (flattened), irregular, or ciliated (*i.e.*, with hair-like projections). The membranes formed by these cells may be only one cell thick, as in the major part of the gastrointestinal tract, or consist of several layers, as in the epidermis of the skin. Columnar epithelium covers the intestinal tract from the end of the esophagus to the beginning of the rectum. It also lines the ducts of many glands. A typical form covers the villi (nipple-like projections) of the small intestine. Cubical epithelium is found in many glands and ducts (*e.g.*, the kidney), the middle ear, and the brain. Squamous, or flattened, epithelial cells, very thin and irregular in outline, occur as the covering epithelium of the alveoli of the lung and of the glomeruli and capsule of the kidney. Ciliated epithelium lines the trachea, bronchi of the lungs, parts of the nasal cavities, the uterus and oviduct of the female, and the vas deferens and epididymis of the male. A single projection from the exposed surface of a cell, usually large and long, is called a flagellum. Flagellated cells are common on the surface of many simple animals.

When the cells of an epithelial surface are several layers deep, various epithelial types can be distinguished: stratified, stratified ciliated, and transitional epithelium. In stratified epithelium, which is found in the epithelium of the skin and of many mucous membranes (*e.g.*, mouth, esophagus, rectum, conjunctiva, vagina), the surface cells are flattened, those of the middle layer are polyhedral, and those of the lowest layer are cubical or columnar. This type of epithelium covers surfaces exposed to friction. The surface cells are constantly being rubbed off and are replaced by new cells growing up from below. Hence, the deepest layer is formative, and successive stages upward reveal a gradual transformation into scaly cells that no longer show any sign of being alive.

In stratified ciliated epithelium the superficial cells are ciliated and columnar. This epithelium lines parts of the respiratory passages, the vas deferens, and the epididymis. Transitional epithelium lines the urinary bladder; its appearance depends upon whether the bladder is contracted or distended.

epoch, unit of geological time during which a rock series is deposited. It is a subdivision of a geological period (*q.v.*) and the word is capitalized when employed in a formal sense (*e.g.*, Pleistocene Epoch). Additional distinctions can be made by appending relative time terms, such as early, middle, and late. The use of "epoch" is usually restricted to divisions of the Tertiary and Quaternary periods.

epochē, in Greek philosophy, "suspension of judgment," a principle originally espoused by

nondogmatic philosophical Skeptics of the ancient Greek Academy who, viewing the problem of knowledge as insoluble, proposed that, when controversy arises, an attitude of noninvolvement should be adopted in order to gain peace of mind for daily living.

The term has been employed in the 20th century by Edmund Husserl, the founder of Phenomenology, who saw it as a technique, more fundamental than that of abstraction and the examination of essences, that serves to highlight consciousness itself. The philosopher should practice a sort of Cartesian doubt, methodic and tentative, in regard to all commonsensical beliefs; he should put them, and indeed all things of the natural-empirical world, in "brackets," subjecting them to a transcendental suspension of conviction—to *epochē*. Without ceasing to believe in them, he should put his belief out of action in order to focus upon the sheer appearances of houses, trees, and men, which then become tantamount to the existence of his awareness of them. Thus, consciousness itself is immune from the *epochē* that dissolves its objects. The *epochē* has done its work, however, as soon as consciousness has been made manifest to his inner perception, for only then can consciousness be subjected to the same generalizing abstraction and examination of essence that had been applied to its objects. Thus, a pure phenomenology is produced that supplements the ontologies (theories of being) for special areas and explains how their objects appear or are given.

Eporedia (ancient Roman district and town, Italy): *see* Ivrea.

EPP (biology): *see* end-plate potential.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Epping Forest, district, county of Essex, England, at the northeastern edge of Greater London. The original forest was a royal hunting ground that was gradually enclosed; only through opposition by holders of common rights was it in part saved in the Epping Forest Act of 1871. The remaining 5,600 ac (2,300 ha) passed to the care of the Corporation of the City of London.

The present district extends over 133 sq mi (345 sq km). The market town of Epping serves the area as a prosperous suburban shopping centre. Other modern suburbs within the district include Chigwell, Waltham Holy Cross, and Ongar. Pop. (1982 est.) 115,100.

EPR: *see* electron paramagnetic resonance.

Epsilon Aurigae, binary star system including one of the largest known stars and having one of the longest periods (27 years) among eclipsing binaries. The diameter of Epsilon Aurigae B, a cool yellow star, has been estimated as thousands of times that of the Sun; if Epsilon Aurigae B occupied the Sun's place at the centre of the solar system, the Earth and even the remote planet Saturn would lie within the star.

Epsilon Aurigae A, a yellow-white star, is measured at about 200 solar diameters. The maximum apparent magnitude of the combination is about 3.0.

Epsom and Ewell, district (borough), county of Surrey, England, at the foot of the North Downs, on the western periphery of Greater London. It has an area of 13 sq mi (34 sq km). It became important with the discovery (*c.* 1618) of mineral springs (from which Epsom salts were named). Horse racing began there as early as the residence of James I (1603–1625) at Nonsuch Park, becoming permanent in 1730. The famous Epsom meeting, at which the main races are the Derby (1780)

and the Oaks (1779), takes place in the first week of June. Many racing stables also use the chalk downs. The market town is now the shopping centre of a large suburban area. Pop. (1982 est.) 69,400.

epsomite, a common sulfate mineral, hydrated magnesium sulfate ($MgSO_4 \cdot 7H_2O$). Its deposits are formed by evaporation of mineral waters, as at Epsom, Surrey, Eng., where it was discovered in 1695. It also is found as crusts and efflorescences in coal or metal mines, in

Epsomite from Hungary

limestone caves, and in the oxidized zones of sulfide ore deposits. The purified compound is used in medicine as Epsom salts. For detailed physical and mineralogical properties, *see* sulfate mineral (table).

EPSP (biology): *see* excitatory postsynaptic potential.

Epstein, Sir Jacob (b. Nov. 10, 1880, New York City—d. Aug. 21, 1959, London), one of the leading portrait sculptors of the 20th century whose work, though seldom innovative, is widely heralded for its perceptive depiction of character and its modelling technique.

Epstein, 1949
EB Inc.

Epstein's early ambition was to be a painter, and he spent his adolescence sketching the teeming ghetto life of New York City, showing even then the obsession with human personality that distinguishes much of his mature work. Faulty eyesight forced him to abandon painting for sculpture, and after studying two years in Paris, he set up a sculpture studio in London in 1905. He soon began to make his way as a portrait sculptor, despite the public scandals caused by the nudity of his so-called Strand Statues (1907–08; destroyed 1937) and the debauched-looking angel on his memorial (1912) for the English writer Oscar Wilde.

In 1913, Epstein became a founding member of the London Group, a loose association of artists and writers promoting modern art in

England. Over the next two years, he developed a mildly experimental style that yielded some of his most powerful works, characterized by their extreme simplification of forms and calm surfaces. Most of these pieces were carved from stone, but the strongest work of the period, "The Rock Drill" (1913; Tate Gallery, London), was modeled in plaster, and its robotlike form reflects his short-lived interest in sleek, abstract design.

With the dissolution of the London Group in 1916, Epstein began to work in the two modes for which he is best-known. Works of the first mode, mostly religious and allegorical figures such as "Genesis" (1930) and "Ecce Homo" (1934-35), consisted of crude, brutal-looking forms carved directly into a megalith, often revealing the shape of the original block. The second mode, a multitude of bronzes cast from modeled clay, forms the bulk of his work. These brilliantly executed studies of the rich and the celebrated are characterized by subtle treatment of planes and richly agitated surfaces. At first used to accentuate the play of light on bronze, the rough surfaces were later exaggerated to such an extent that they bore little relationship to the sculptural mass and became merely decorative. Occasionally, he also made monumental bronzes, such as "St. Michael and the Devil" (1958; Coventry Cathedral, Coventry, Eng.). In his later years, Epstein became a vehement opponent of abstract sculptors. He was knighted in 1954.

Epstein-Barr virus (EBV), virus of the Herpesviridae family that is the major cause of acute infectious mononucleosis, a common syndrome characterized by fever, sore throat, extreme fatigue, and swollen lymph glands.

In developing countries, infection with Epstein-Barr virus occurs in almost all children before the age of five and is not associated with recognizable symptoms. In industrialized countries, however, about half of the population successfully avoids infection through their late teens or early 20s. When infection is delayed until the teenage or early adult years, the body seems to respond to it differently. In about two-thirds of these cases, infection is asymptomatic or very mild. In the remaining one-third of the cases, infection causes mononucleosis. Infectious mononucleosis also may be caused by other agents such as cytomegalovirus and *Toxoplasma gondii*.

Epstein-Barr virus was first reported by British scientists Michael Anthony Epstein, Yvonne M. Barr, and Bert G. Achong, who found viruslike particles in cells grown from tissues involved with a newly described lymphatic cancer. The Epstein-Barr virus is known to be able to infect only two different types of cells in the body: some salivary gland cells and one special type of white blood cell (leukocyte). Virus that infects the salivary gland cells is carried into the mouth in the stream of saliva, which is the only bodily fluid that has been proved to contain infectious Epstein-Barr virus particles. The type of white blood cell called the B lymphocyte can also carry Epstein-Barr virus. These highly specialized cells manufacture antibodies to help fight infections. Within the salivary gland the virus growth cycle is completed and infectious virus particles are generated; within the B lymphocytes, however, the virus growth cycle is abortive, and the Epstein-Barr virus persists in the B lymphocyte in a partially replicated state for the life of the cell.

Even though the virus growth in the B cell is incomplete, the lymphocyte is permanently altered by the infection process—*i.e.*, B cells can take on growth characteristics that resemble those of cancerous lymphocytes. The affected B lymphocytes can multiply excessively to produce a cancer of the lymphatic system.

Other rare disorders have also been linked with Epstein-Barr virus. These include the African lymphoid cancer called Burkitt's lymphoma;

nasopharyngeal carcinoma, a cancer of the nasal sinuses and throat that is common in southern China, in Southeast Asia, in northern Africa, and among Eskimos; and certain neurological illnesses, including encephalitis (inflammation of the brain) and paralysis of various nerve groups (for example, Bell's palsy, which affects the facial nerve and results in paralysis of one side of the face).

It was initially thought that chronic fatigue syndrome, a disorder characterized by at least six months of debilitating fatigue that is not improved by rest, was caused by infection with Epstein-Barr virus; it now seems clear that chronic fatigue syndrome is not caused exclusively by any single infectious agent, including EBV.

There are no specific treatments for any form of infection with the Epstein-Barr virus, and no vaccines have yet been developed.

epyllion, brief narrative poem in dactylic hexameter of ancient Greece, usually dealing with mythological and romantic themes. It is characterized by lively description, scholarly allusion, and an elevated tone similar to the elegy. Such poems were especially popular during the Greek Alexandrian period (c. 4th-3rd century BC), as seen in the works of Callimachus and Theocritus, although the term *epyllion* was not applied to them until the 19th century. Late Republican and early Augustan Latin poetry, such as Catullus' poem on the marriage of Pythius and Thetis and Ovid's *Metamorphoses* (c. AD 1-8), reflect the influence of the *epyllion*, as do the troubadour songs of the Middle Ages and modern Greek Klephtic songs.

equal-field system, Chinese (Wade-Giles romanization) CHÜN-T'ÏEN, Pinyin JUNTIAN, official institution of land distribution and tax collection in traditional China and Japan. The system originated in China in AD 485 by order of the emperor Hsiao-wen ti of the Northern Wei dynasty. It provided for the assignment of agricultural lands to all adult peasants and thereby slowed the accumulation of lands by wealthy families. During the Northern Wei a man and wife were entitled to a total of about 140 *mou* (about 20 acres [8 hectares]), of which a small part was irrevocably held by them; the remaining land was returned to the government upon their deaths. During the Sui and T'ang periods (581-907) the system was enforced throughout the country and became the most important fiscal institution of the central government. Each adult between the ages of 21 and 59 was given 100 *mou* (about 15 acres [6 hectares]), of which one-fifth was permanently owned. A fixed amount of produce from the land was subsequently paid as tax in kind to the government. The greatest allotment of land was limited to 100 *ch'ing* (10,000 *mou*) and was reserved only for the most highly ranked of the great families. The system gradually declined with the swift growth in population (early 8th century), as most peasants increasingly inherited less than 100 *mou*, and most landholdings came to be permanently held and not redistributed. Most of the better lands were then acquired by wealthy families, and the original per capita tax system declined rapidly. After the collapse of the system during Hsüan-tsung's reign (712-756), it was not reinstated except on a local scale.

The equal-field system was applied in Japan as a result of the Taika reforms (AD 646) but declined in the Nara period (710-784), when both nobles and monasteries were given additional land allotments and tax-free status.

equal protection, in U.S. law, the constitutional guarantee that no person or group will be denied that protection under the law which is enjoyed by similar persons or groups—*i.e.*, persons similarly situated must be similarly treated. Equal protection is extended when the

rules of law are applied equally in all like cases and when persons are exempt from obligations greater than those imposed upon others in like circumstances. In the United States, the Fourteenth Amendment to the Constitution, one of three post-Civil War amendments, prohibits states from denying any person "the equal protection of the laws."

Traditionally, until the 1960s, the Supreme Court held that the postwar amendments had but one purpose: to guarantee "the freedom of the slave race . . . and the protection of the newly-made freeman and citizen from the oppressions of those who had formerly exercised unlimited domination over him." Thus, the equal-protection clause of the Fourteenth Amendment was applied minimally, except in cases of racial discrimination. As late as 1927, in *Buck v. Bell*, Justice Oliver Wendell Holmes referred to equal protection as "the usual last resort of constitutional arguments."

In the 1960s, however, the court under Chief Justice Earl Warren dramatically transformed the concept of equal protection, applying it to cases involving welfare benefits, exclusionary zoning, municipal services, and school financing. Equal protection became a prolific source of constitutional litigation. Under Chief Justice Warren E. Burger the court added considerably to the list of situations that might be adjudicated under the doctrine of equal protection, including sexual discrimination, status and rights of aliens, and legitimacy of birth.

Equal Rights Amendment (ERA), a proposed but unratified amendment to the U.S. Constitution that was designed mainly to invalidate many state and federal laws that discriminate against women; its central underlying principle was that sex should not determine the legal rights of men or women.

The text of the proposed amendment stated that "Equality of rights under the law shall not be denied or abridged by the United States or by any State on account of sex" and further that "the Congress shall have the power to enforce, by appropriate legislation, the provisions of this article." The amendment was first introduced to Congress in 1923, shortly after women in the United States were granted the right to vote, and it was finally approved by the U.S. Senate 49 years later, in March 1972. It was then submitted to the state legislatures for ratification within seven years but, despite a deadline extension to June 1982, was not ratified by the requisite majority of 38 states. It would have become the 27th Amendment to the Constitution.

Although the ERA gained ratification of 30 states within one year of its Senate approval, mounting intense opposition from conservative religious and political organizations effectively brought ratification to a standstill. The main objections to the ERA were based on fears that women would lose privileges and protections such as exemption from compulsory military service and combat duty and economic support from husbands for themselves and their children.

Advocates of the ERA, led primarily by the National Organization for Women (NOW), maintained, however, that the issue was mainly economic. NOW's position was that many sex-discriminatory state and federal laws perpetuated a state of economic dependence among a large number of women and that laws determining child support and job opportunities should be designed for the individual rather than for one sex. Many advocates of the ERA believed that the failure to adopt the measure as an amendment would cause women to lose many gains and would give a negative mandate to courts and legislators regarding feminist issues.

equal temperament, also called **WELL-TEMPERED TUNING**, in music, tuning system in which the octave is divided into 12 semitones of equal size. Because it enables keyboard instruments to play in all keys, the system replaced earlier tuning systems in France and Germany by the late 18th century and in England by the 19th; before its use on keyboard instruments, it was used for fretted instruments, such as the lute.

Although Andreas Werckmeister, a German organist and theorist, is usually credited with devising the system in about 1700, he was preceded by the physicist Marin Mersenne in 1685 and, outside Europe, by the Chinese prince Chu Tsai-yü in 1596. The Florentine music theorist Vincenzo Galilei (father of the astronomer Galileo) proposed a very similar system in 1581. In addition, equal temperament was approximated in various degrees in the minor tuning adjustments made by organ tuners and harpsichordists. Johann Sebastian Bach's *The Well-Tempered Clavier* (1722, 1744) may well have been written for such a "practical tuner's" system.

In equal temperament, each semitone is measured at 100 cents (1 cent = $\frac{1}{1200}$ octave). Because tuning is calculated by dividing up the octave into smaller units, equal temperament is a divisive system; earlier European systems were cyclic—*i.e.*, they calculated new intervals by adding together previously determined intervals. In equal temperament, a fifth, such as C–G, is imperceptibly narrower than the fifth found in the natural harmonic series (*see* overtone) by 2 cents; but it is not as much smaller than the fifth used in the previous tuning system, meantone temperament. The interval of a third in meantone tuning is pure, or natural; in equal temperament, it is noticeably wider (14 cents). *Compare* meantone temperament.

equation of ———: *see under* substantive word (*e.g.*, state, equation of).

equator, great circle around the Earth that is everywhere equidistant from the geographic poles and lies in a plane perpendicular to the Earth's axis. This geographic, or terrestrial, equator divides the Earth into the Northern and Southern hemispheres and forms the imaginary reference line on the Earth's surface from which latitude is reckoned; in other words, it is the line with 0° latitude.

In astronomy, the celestial equator is the great circle in which the plane of the terrestrial equator intersects the celestial sphere; it consequently is equidistant from the celestial poles. When the Sun lies in its plane, day and night are everywhere of equal length, a twice-per-year occurrence known as equinox.

equatorial convergence zone (meteorology): *see* intertropical convergence zone.

equatorial countercurrent, current phenomenon noted near the equator, an eastward flow of oceanic water in opposition to and flanked by the westward equatorial currents of the Atlantic, Pacific, and Indian oceans. Lying primarily between latitude 3° and 10° N, the countercurrents shift south during the northern winter and north during the summer. To either side the trade winds blow constantly and push great volumes of water westward in the equatorial currents, raising the sea level in the west. Within the doldrums, where strong constant winds are absent, the higher western sea levels flow downslope to the east. The Pacific Equatorial Countercurrent is very strong and is definable year-round. The Atlantic Equatorial Countercurrent is strongest off the coast of Ghana (Africa), where it is known as the Guinea Current. The countercurrent of the Indian Ocean flows only during the northern winter and only south of the equator.

equatorial current, ocean current flowing westward near the equator, predominantly controlled by the winds. Characteristically, equatorial-current systems consist of two westward-flowing currents approximately 600 miles (1,000 km) wide (North and South equatorial currents) separated by an eastward-flowing countercurrent only 300 miles (480 km) wide. Usually flowing at depths of less than 1,650 feet (500 m), equatorial currents travel at rates of 10 to 40 inches per second (25 to 100 cm per second). Equatorial undercurrents, centred on the equator at depths of 160 to 500 feet (49 to 152 m), flow eastward at rates up to 5 feet/s (1.5 m/s) and are approximately 1,000 feet (305 m) deep and 640 miles (1,030 km) wide.

The Pacific South Equatorial Current, flowing approximately between latitude 5° N and 15°–20° S, is propelled westward by the Southeast Trade Winds to about longitude 180° E. There it splits, part turning north to blend with the countercurrent and the rest veering south to become the East Australian Current and a flow passing east of New Zealand. The latter feeds the South Pacific Current and West Wind Drift, which move eastward to the Peru Current. The Peru Current flows north as a source of the Pacific South Equatorial Current.

The Pacific North Equatorial Current is given a westward impetus by the Northeast Trade Winds (latitude 10°–25° N). Upon reaching the Philippines, the current divides, with the lesser part turning south and then east to start the Pacific Equatorial Countercurrent, and the greater part flowing north. This flow, known as the Kuro Current, moves north as far as Japan, then east as the North Pacific Current (West Wind Drift), part of which then turns south as the California Current, which joins the equatorial countercurrent to form the Pacific North Equatorial Current.

The Atlantic South Equatorial Current is pushed westward by the Southeast Trade Winds (latitude 0°–20° S). Approaching Cape St. Roque, Brazil, it divides. One stream goes north as the Guiana Current, which in turn feeds the Caribbean Current, the equatorial countercurrents, and the Guinea Current. The other, moving south as the Brazil Current, turns east off the Río de la Plata (as the South Atlantic Current) then pushes to the African coast, where it veers north as the Benguela Current. This joins the Guinea Current to reform the Atlantic South Equatorial Current.

The Atlantic North Equatorial Current is pushed westward by the Northeast Trade Winds between latitude 10° and 20° N. Fed in part by the South Atlantic Equatorial, it turns north as the Antilles, Caribbean, and Florida currents, which eventually become the Gulf Stream. Some of the Gulf Stream's waters eventually arc southward as the Azores and Canary currents, which swing west to join upwelling water off the west coast of North Africa. This gives birth to the Atlantic North Equatorial, which, as it crosses the Mid-Atlantic Ridge, jogs north only to bend south beyond the ridge.

In the Indian Ocean the place of a north equatorial current is taken by the Monsoon Current. There is, however, an Indian South Equatorial Current. Flowing westerly with the trades north of latitude 22° S, it divides to form the East Africa Coastal Current, moving northward, and a south-flowing stream. The latter passes by Madagascar as the Mozambique (west) and Mascarene currents, which become the Agulhas Current. At the Cape of Good Hope this feeds east into the South Indian Current, which supplies the West Australian Current. The latter is a source of the Indian South Equatorial Current.

The equatorial currents have similar climatic effects upon continental shores they touch, bringing warmth and higher humidity to the east coasts and dry conditions to the west.

Equatorial Guinea, officially **REPUBLIC OF EQUATORIAL GUINEA**, Spanish **REPÚBLICA DE GUINEA ECUATORIAL**, republic on the west coast of equatorial Africa and several small islands. Equatorial Guinea's continental region, called Río Muni, is bordered by Cameroon to the north and Gabon to the east and south. The Bight of Biafra (the innermost bay of the Gulf of Guinea) separates Río Muni from the country's main island area of Bioko (Fernando Po) to the northwest; the small island of Annobón lies southwest in the Atlantic Ocean. The capital, Malabo (formerly Santa Isabel), is on Bioko. Area 10,830 square miles (28,051 square km). Pop. (2003 est.) 494,000.

A brief treatment of Equatorial Guinea follows. For full treatment, *see* **MACROPAEDIA: Western Africa**.

For current history and for statistics on society and economy, *see* **BRITANNICA BOOK OF THE YEAR**.

The land. The coastal plain (12 miles [20 km] wide) of the continental region abuts coastal hills leading to inland plateaus that rise eastward toward the frontier with Gabon. The continental region is divided by the Benito River, which runs generally from east to west. The coast consists of a long stretch of beach with low cliffs toward Kogo to the south. The island of Bioko consists of three extinct vol-

Equatorial Guinea

canic cones and has several crater lakes and rich lava soils; in the north, one of the extinct volcanoes rises to an elevation of 9,869 feet (3,008 m). The southern part of the island consists of rugged ranges indented by torrents having unexploited hydroelectric potential.

Both the mainland region and Bioko have a humid tropical climate and a modest dry season. The rainfall of the coastal continental region ranges between about 95 and 180 inches (2,400 and 4,600 mm) a year; less rain falls in the interior and during the months from June to August. Bioko has a rainy, debilitating climate with a slightly drier period from November to March. The remainder of the year on Bioko is wet, cloudy, and hot. The average yearly temperature in the country is a constant 79° F (26° C).

Dense tropical rain forests prevail throughout the continental region and includes okume (*Aucoumea klaineana*), African walnut, and various mahoganies. Animal life, including gorillas, chimpanzees, monkeys, leopards, elephants, and crocodiles, has been decimated by overhunting. Bioko has mangrove swamps along the coast and no big game.

The people. More than two-fifths of the population are the Bantu-speaking Fang people. They represent nearly nine-tenths of the population on the mainland and a growing number on Bioko. The original inhabitants of Bioko are the Bubi, descendants of Bantu migrants from the mainland. In addition to these two main groups, there are a number of smaller Bantu-speaking tribes along the coast of the mainland and also, on Bioko, the descendants of former slaves liberated by the British during the 19th century.

Spanish is the official language of Equato-

rial Guinea. Pidgin English is used in local commerce and is spoken widely on Bioko, and each ethnic group also speaks its own language. The vast majority of the population is nominally Roman Catholic; however, the Bubi retain traditional forms of worship. The only Muslims are a few Hausa traders.

More than three-fourths of the population of Equatorial Guinea lives in the continental region and is generally evenly dispersed. The population of Bioko is predominantly urban, most people living in Malabo. Bata is the chief urban centre of the continental region.

Equatorial Guinea's population is growing more slowly than that of most other countries in western Africa; the country's birth rate is somewhat lower, and its death rate is somewhat higher. Because of political repression, substantial emigration from the country also occurred during the 1970s, including most of the numerous Nigerian migrant workers employed on the cocoa plantations on Bioko. It is estimated that about one-third of the country's total population now lives in exile.

Economy. Equatorial Guinea has a mixed, developing economy based traditionally on agriculture. Economic conditions, seriously deteriorated in the late 1970s, improved somewhat after the ouster of a dictatorial president in 1979. Severe shortages of both skilled labour and capital are major obstacles to economic recovery, however. The country's gross national product (GNP) was once one of the lowest in Africa, but the discovery of large reserves of petroleum and natural gas in the 1980s raised the GNP dramatically. GNP per capita in Equatorial Guinea is now one of the highest in sub-Saharan Africa.

Petroleum now accounts for nearly four-fifths of Equatorial Guinea's export earnings and contributes nearly two-thirds of its gross domestic product (GDP), far outstripping agriculture, which once formed the largest share of the GDP.

Cacao, timber, and coffee are the country's main agricultural exports, with cacao accounting for the major share. After the expulsion or departure of most foreigners in the early and mid-1970s, production declined drastically. The heavily mechanized timber industry on the mainland also suffered with the departure of European investment funds and management skills. Cacao and timber output increased substantially after the 1979 coup because of the new government's revitalization efforts, but neither has returned to the production levels before independence. Coffee is grown mainly along the Cameroon border on the mainland. Other crops are bananas grown on Bioko, palm oil from the continental region, and cassava.

The fishing industry is being developed by Spain, Nigeria, and Morocco under agreements negotiated in the early 1980s. Commercially exploitable quantities of gold, iron ore, manganese, and uranium are thought to exist inland.

Industry accounts for only a tiny percentage of the country's GDP and is limited to the processing of agricultural products. Electricity shortages have been recurrent since independence. The country's fairly extensive road network is not well maintained. Malabo, the main harbour, has been rehabilitated by a French firm and has regular services to Europe. Bata harbour on the mainland was also modernized by French contractors. International air service is provided by Iberia and Cameroon airlines.

Despite the headway made since 1979, Equatorial Guinea remains heavily dependent on international aid, primarily from the International Monetary Fund, Spain, and France. Signs of political instability have discouraged foreign investment and foreign labour despite government efforts to attract them, and the country's economic progress hinges mainly on its good relations with Spain and France.

Government and social conditions. Equatorial Guinea is a western African republic. A new constitution was drafted by a government commission with assistance from the United Nations and was adopted in 1982. It created an elected National Assembly vested with legislative responsibility, a Council of State, and a National Council for Economic and Social Development. The Council of State approves candidates for presidential elections. Equatorial Guinea's military forces are organized into an army, navy, and air force and receive aid and training from Spain.

Health conditions of Equatorial Guinea are generally poor; average life expectancy is about 52 years for males and 57 years for females. The infant mortality rate is above average for sub-Saharan Africa. Malnutrition is common, and most of the people suffer from malaria at some point during their lives. These health problems are aggravated by poor sanitary conditions and a severe shortage of medical personnel in the country. In the early 1980s, massive preventive health measures were initiated in primary schools and towns.

Equatorial Guinea's education system offers compulsory education for children between 6 and 14 years of age. However, only about three-fourths of the school-age children attend primary school, and only a small percentage advance to secondary school. The Spanish National University of Distant Education operates centres for higher education at Malabo and Bata. Additionally, some Equatorial Guineans go abroad (primarily to Spain and France) to pursue higher education.

The government controls the news media, including several daily (Spanish-language) newspapers, radio stations, and a television station.

Cultural life. Despite a vicer of Spanish culture and Roman Catholic religion, Equatorial Guineans' lives are largely influenced by traditional customs that have undergone a revival since independence. Among the Fang of the continental region, witchcraft, traditional music, and storytelling are important parts of their lives.

History. The first inhabitants of the mainland region appear to have been Pygmies. The now-prominent Fang and Bubi reached to the mainland region and Bioko (then Fernando Po), respectively, in the 17th- and 19th-century migrations of Bantu-speaking peoples. Equatorial Guinea was within the vast area ceded by the Portuguese to the Spanish in the late 18th century; it was frequented by slave traders, as well as by British, German, Dutch, and French merchants.

Bioko was administered by British authorities from 1827 to 1858 before the official takeover by the Spanish. The mainland (Río Muni) was not effectively occupied by the Spanish until 1926.

Through the early and mid-20th century, Spanish Guinea, as it was then called, was exposed to the paternalism of the Spanish government and the Roman Catholic church. The contribution of foreign workers enabled the colony to become an important cocoa and timber producer.

Independence was declared in 1968, followed by a reign of terror and economic chaos engendered by the dictatorial president Francisco Macías Nguema, who was overthrown in 1979 and later executed. Despite the promulgation of a constitution and the development of democratic institutions, the government of Macías' nephew, Teodoro Obiang Nguema Mbasogo, was heavy-handed and generally unwilling to share power in any meaningful way; it remained in power into the 21st century.

equus (Latin: "horseman"), plural **EQUITES**, in ancient Rome, a knight, originally a member of the cavalry and later of a political and administrative class as well as of the equestrian order. In early Rome the equites were drawn from the senatorial class and were called *equites equo publico* ("horsemen whose mounts were provided for by the public"). They were the most influential members of the voting assembly called the *Comitia Centuriata*. From the beginning of the 4th century BC, non-senators were enlisted in the cavalry; they provided their own horses (*equites equo privato*). By the 1st century BC, foreign cavalry tended to replace them in the field and thus to restrict the equestrian order to posts as officers or members of the general's staff. By this time the equites had become a class distinct from the senators. Unlike senators they were legally free to enter the fields of commerce and finance. Known as *publicani*, those who were businessmen enriched themselves by securing contracts to supply the army and to collect taxes and by exploiting public lands, mines, and quarries in the provinces. In this way the equites became a prosperous business and landowning class, eventually forming a third political group, along with the *optimates* and *populares*, whom they occasionally rivaled in the growing power struggle in Rome.

Augustus, the first emperor (reigned 27 BC-AD 14), reorganized the equestrian order as a military class, thus removing it from the political arena. The emperor appointed its members (under the republic they had been appointed by the censor). Qualifications for membership were free birth, good health and character, and sufficient wealth. Senators' sons were eligible by right of birth but lost this title on admittance to the Senate. In an equestrian career a number of subordinate military posts were obligatory, although dependent on nomination by the emperor. A purely civil career became possible in the 1st century AD as the equites expanded into the imperial household much like modern civil servants. Their business background and connection with public finances seemed particularly to qualify them for the role of imperial agents in the financial administration of the provinces.

Equiano, Olaudah (b. c. 1750, Benin, kingdom of Benin—d. April/May 1797, England), west African sold into slavery and later freed, who wrote an enormously popular autobiography, *The Interesting Narrative of the Life of Olaudah Equiano, or Gustavus Vassa, the African* (1789). The book's strong abolitionist stance and interesting, detailed description of life in Benin was so much in demand that by 1794 it had run through eight English editions and one in the United States.

Captured at age 12, Equiano was taken to the West Indies, where he traveled widely with his master and received some education before he was freed. Once in England he became an active abolitionist, agitating and lecturing against the cruelty of British slave owners in Jamaica, and in 1787 he was appointed commissary aboard the *Vernon*, which was carrying 500 to 600 freed slaves to Freetown, Sierra Leone, to establish a settlement there. Publication of his autobiography was aided by British abolitionists who were collecting evidence on the sufferings of slaves. In that book and in later *Miscellaneous Verses . . .*, he idealizes his African past and shows a great pride in his race while attacking those Africans who trafficked in slavery (a perspective further shown by his setting forth not only the injustices and humiliations of his fellow slaves but also the kindness of his own master and of English women who befriended him). As a whole, Equiano's work shows both broad human compassion and realism.

equilibrium, in physics, condition in which the resultant or vector sum of all forces acting upon a particle is zero. A rigid body (by definition distinguished from a particle in having the property of extension) is considered to be

in equilibrium if, in addition, the algebraic sum of the moments of the force components, both translational and rotational, along or about each of three mutually perpendicular axes chosen with respect to the body, is equal to zero. Thus, the body in equilibrium experiences neither linear acceleration nor angular acceleration and, unless disturbed by an outside force, will continue in that condition indefinitely. An equilibrium is said to be stable if small, externally induced displacements from that state produce forces that tend to oppose the displacement and return the body or particle to the equilibrium state. Examples include such systems as a pendulum or a brick lying on a level surface. An equilibrium is unstable if the least departures produce forces tending to increase the displacement. An example is furnished by a ball bearing balanced on the edge of a razor blade.

equilibrium, chemical: *see* chemical equilibrium.

equine, one of the mammal family of Equidae (order Perissodactyla) that includes the modern horses, zebras, and asses, as well as more than 60 species known only from fossils.

All six modern members of the family are placed in the genus *Equus*. Only the races of *E. caballus* (including the myriad domestic strains) are called horses; three species (*E. zebra*, *E. burchelli*, and *E. grevyi*) are called zebras; and two (*E. asinus* and *E. hemionus*) are usually called wild asses.

Wild horses once inhabited much of northern Eurasia, primarily in open areas. They were rather small, short-legged animals, compared with their domesticated descendants, standing only about 120 to 130 cm (47 to 51 inches) at the shoulder. In the two millennia BC, horses from many wild populations were domesticated; often the remainder of the wild individuals were exterminated. By the early 19th century, two races were still extant: the tarpan (*E. caballus caballus*), found in eastern Europe until the middle of the century, and Przewalski's horse (*E. caballus przewalskii*, often considered a distinct species, *E. przewalskii*), which inhabited the remote steppe region between China and Mongolia.

The North American wild horses are descendants of domestic horses that escaped or were released during the early colonial days. *See also* ass; horse; Przewalski's horse; tarpan; zebra.

equine encephalitis, also called EQUINE ENCEPHALOMYELITIS, severe viral disease of horses and mules. It sometimes affects birds, reptiles, and humans.

Of the several strains of the virus, the most prevalent are the A group, which includes the Eastern, Western, and Venezuelan strains, and the B group, which includes the Japanese and St. Louis strains. The virulent Western type has a mortality as high as 90 percent in horses and 10 percent in humans.

Immunity lasting one year is conferred by recovery from the disease or by vaccination with killed vaccine. Birds appear to harbour the disease but do not exhibit any definite symptoms. The mosquito transmits the virus from birds to horses, mules, or humans. Other animals may be infected in the same way but not show symptoms. Sheep and cats appear to be resistant.

Symptoms in horses include disturbances in equilibrium, high fever, incoordination, and paralysis; those in humans include headache, drowsiness, sweating, and mental confusion. Because of the symptoms the disease is often mistakenly called sleeping sickness. Treatment is aimed at making the victim comfortable. The disease can cause permanent brain damage. Control centres on eradication of mosquito

to carriers and the use of vaccines against the Eastern and Western strains.

equine infectious anemia (EIA), also called SWAMP FEVER, viral disease of horses. Symptoms, which appear about two weeks after exposure, include fever and rapid breathing; the animal shifts its weight from one leg to another because of weakness during an attack. An attack lasts three to five days. In the chronic form the fever recurs at intervals that vary from days to months. The affected animal is apt to have a shaggy coat, to be thin, weak, and sluggish, and to have legs swollen with dropsy. An asymptomatic animal may carry the virus. Human infection, although rare, has been reported.

equine plague: *see* African horse sickness.

equine respiratory disease, a complex of infections of viral origin, including equine viral rhinopneumonitis (viral abortion), equine viral arteritis, equine influenza and parainfluenza, and equine rhinovirus infection. The diseases are clinically indistinguishable. All cause fever, coughing, and respiratory difficulty; some cause abortion in mares. Treatment includes rest and supportive care. Secondary infections from bacteria, which may create more serious illness, can be prevented by use of drugs.

equinox, either of the two moments in the year when the Sun is exactly above the equator and day and night are of equal length; also, either of the two points in the sky where the ecliptic (the Sun's annual pathway) and the celestial equator intersect. The vernal equinox, marking the beginning of spring in the Northern Hemisphere, occurs about March 21, when the Sun moves north across the celestial equator. The autumnal equinox falls about September 23, as the Sun crosses the celestial equator going south.

Celestial sphere showing the positions of the equinoxes

Some astronomical coordinates—*e.g.*, right ascension and celestial longitude—are measured from the vernal equinox. It is sometimes called the first point of Aries because it was at the beginning of that constellation some 2,000 years ago. The term is still used, though precession of the equinoxes has moved the vernal equinox into Pisces.

equinoxes, precession of the, motion of the equinoxes along the ecliptic (the plane of the Earth's orbit) caused by the cyclic precession of the Earth's axis of rotation.

In compiling his famous star catalog (completed in 129 BC), the Greek astronomer Hipparchus noticed that the positions of the stars were shifted in a systematic way from earlier Babylonian (Chaldean) measures. This indicated that it was not the stars that were moving but rather the observing platform—the Earth. Such a motion is called precession and consists of a cyclic wobbling in the orientation

of the Earth's axis of rotation with a period of almost 26,000 years. Precession was the third-discovered motion of the Earth, after the far more obvious daily rotation and annual revolution. Precession is caused by the gravitational influence of the Sun and the Moon acting on the Earth's equatorial bulge. To a much lesser extent, the planets exert influence as well.

The projection onto the sky of the Earth's axis of rotation results in two notable points at opposite directions: the north and south celestial poles. Because of precession, these points trace out circles on the sky. Today, the north celestial pole points to within just 1° of the arc of Polaris. It will point closest to Polaris in AD 2017. In 12,000 years the north celestial pole will point about 5° from Vega. Presently, the south celestial pole does not point in the vicinity of any bright star.

Also moving with this wobble is the projection onto the sky of the Earth's equator. This projection, a great circle, is called the celestial equator. The celestial equator intersects another useful great circle, the ecliptic. As the Earth orbits the Sun, the constantly changing direction from which we view the Sun causes it to trace out the ecliptic. The celestial equator is inclined at a 23.5° angle to the ecliptic (the so-called obliquity of the ecliptic). The celestial equator and the ecliptic intersect at two points called the equinoxes (vernal and autumnal). During the course of the year, as the Earth orbits the Sun, the latter is seen crossing the equator twice, in March moving from the Southern Hemisphere into the Northern Hemisphere and in September moving in the opposite direction. The equinoxes drift westward along the ecliptic at the rate of 50.2 arc-seconds annually as the celestial equator moves with the Earth's precession.

equipartition of energy (mathematics): *see* energy, equipartition of.

Equisetum (plant genus): *see* horsetail.

equites (ancient Rome): *see* eques.

equity, in Anglo-American law, the custom of courts outside the common law or coded law. In origin, equity provided remedies in situations in which precedent or statutory law might not apply or be equitable.

By the end of the 13th century the English king's common-law courts had largely limited the relief available in civil cases to the payment of damages and to the recovery of the possession of property. They had refused to extend and diversify their types of relief so as to meet the needs of new and more complex situations. Disappointed litigants had turned to the king with petitions for justice because the courts had afforded either no remedy or one that was ineffective. These petitions were referred to the lord chancellor, who was the king's principal minister. By the early years of the 14th century the petitions were going directly to the chancellor, and by the middle of that century the Chancery was recognized as a new and distinct court.

The developments thus initiated resulted in the fashioning by the chancellor of new equitable remedies. The following are representative: specific performance of contract, whereby the victim of a breach might compel the exact performance promised if damages would be a poor substitute, as in contracts to sell land and unique chattels; the enforcement of trusts, where one who had been given title to property in order to manage it for another was required to fulfill his fiduciary obligations; injunction to prevent threatened or continuing wrong, such as destruction of the plaintiff's invaluable shade trees; restitution of benefits wrongfully acquired, by compulsory surrender of the ill-gotten gains, in order to prevent unjust enrichment; the correction and cancellation of written instruments for mistake and misrepresentation; and the equity of redemp-

tion, which enabled a defaulting mortgagor to reclaim his land if he tendered principal and interest within a reasonable time after forfeiture and before foreclosure. Such new equitable remedies contrasted with the narrow rigidity of the common-law remedies.

The full growth of the equitable remedies was retarded, however, by political pressures from the judges and Parliament not to trespass upon the province of the separate law courts. As a result, the chancellor was forced to agree not to hear any case in which there was an adequate remedy (usually damages) at law. In some situations (e.g., the trust) the courts of law afforded no remedy. Where they did, as in cases of breach of contract and tort (wrongs other than breach of contract and crime), specific relief could not be obtained unless the remedy at law was inadequate or the threatened injury would be irreparable.

Another restrictive influence was the development in the Chancery of a system of precedent. For generations the chancellors had not considered themselves bound by precedents or rules of law; emphasis had been put mainly upon the discretionary treatment of needs of the individual case. From the mid-16th century on, however, the chancellors were usually common lawyers, who began shaping equity into an established set of rules. By the middle of the 17th century the equity administered by the Court of Chancery had become a recognized part of the law of the land: equity gave justice according to law rather than executive justice. Finally, by the Judicature Act of 1873, the competitive, separate law and equity courts, with their attendant delays, expense, and injustices, were abolished and their work combined in a single, departmentalized Supreme Court of Judicature.

Courts of equity also developed early in the United States; but in the late 19th and early 20th centuries most U.S. courts similarly abolished the distinctions between actions at law and suits in equity and fused their administration in one procedural system, with but one civil action, in the same court.

Modern equity has been much assisted by legislation. The old notion that equity protects only property rights has been virtually abandoned. Now an employee, for example, can be barred from competing with his employer after discharge or resignation. Statutes have facilitated specific performance of cooperative-marketing contracts and agreements to arbitrate future commercial or labour disputes. An injunction may now be had, where other factors of appropriateness permit, against threatened injury to interests of personality, such as civil liberties, privacy, reputation, and domestic relations. Enabling legislation has immensely increased the resort to injunction by government agencies, especially to prevent violation of regulatory statutes, notwithstanding criminal penalties.

equivalence, also called EQUIVALENCE OF PROPOSITIONS, in logic and mathematics, the formation of a proposition from two others which are linked by the phrase "if, and only if." The equivalence formed from two propositions p and q also may be defined by the statement " p is a necessary and sufficient condition for q ."

equivalence principle, fundamental law of physics that states that gravitational and inertial forces are of a similar nature and often indistinguishable. In the Newtonian form it asserts, in effect, that, within a windowless laboratory freely falling in a uniform gravitational field, experimenters would be unaware that the laboratory is in a state of nonuniform motion. All dynamical experiments yield the same results as obtained in an inertial state of uniform motion unaffected by gravity. This was confirmed to a high degree of precision by an experiment conducted by the Hungarian physicist Lóránt Eötvös. In Einstein's version,

the principle asserts that in free-fall the effect of gravity is totally abolished in all possible experiments and general relativity reduces to special relativity, as in the inertial state.

equivalent weight, in chemistry, the quantity of a substance that exactly reacts with, or is equal to the combining value of, an arbitrarily fixed quantity of another substance in a particular reaction. Substances react with each other in stoichiometric, or chemically equivalent, proportions, and a common standard has been adopted. For an element the equivalent weight is the quantity that combines with or replaces 1.00797 grams (g) of hydrogen or 7.9997 g of oxygen; or, the weight of an element that is liberated in an electrolysis (chemical reaction caused by an electric current) by the passage of 96,500 coulombs of electricity. The equivalent weight of an element is its gram atomic weight divided by its valence (combining power). Some equivalent weights are: silver (Ag), 107.868 g; magnesium (Mg), 24.312/2 g; aluminum (Al), 26.9815/3 g; sulfur (S, in forming a sulfide), 32.064/2 g. For compounds that function as oxidizing or reducing agents (compounds that act as acceptors or donors of electrons), the equivalent weight is the gram molecular weight divided by the number of electrons lost or gained by each molecule; e.g., potassium permanganate (KMnO₄) in acid solution, 158.038/5 g; potassium dichromate (K₂Cr₂O₇), 294.192/6 g; and sodium thiosulfate (Na₂S₂O₃ · 5H₂O), 248.1828/1 g. For all oxidizing and reducing agents (elements or compounds) the equivalent weight is the weight of the substance that is associated with the loss or gain of 6.023 × 10²³ electrons. The equivalent weight of an acid or base for neutralization reactions or of any other compound that acts by double decomposition is the quantity of the compound that will furnish or react with or be equivalent to 1.00797 g of hydrogen ion or 17.0074 g of hydroxide ion; e.g., hydrochloric acid (HCl), 36.461 g; sulfuric acid (H₂SO₄), 98.078/2 g; sodium hydroxide (NaOH), 74.09/2 g; sodium carbonate (Na₂CO₃), 105.9892/2 g.

The equivalent weight of a substance may vary with the type of reaction it undergoes. Thus, potassium permanganate reacting by double decomposition has an equivalent weight equal to its gram molecular weight, 158.038/1 g; as an oxidizing agent under different circumstances it may be reduced to the manganate ion (MnO₄²⁻), to manganese dioxide (MnO₂), or to the manganous ion (Mn²⁺), with the equivalent weights of 158.038/1 g, 158.038/3 g, and 158.038/5 g, respectively. The number of equivalent weights of any substance dissolved in one litre of solution is called the normality of that solution.

Equus przewalskii: see Przewalski's horse.

era, a very long span of geological time; in formal usage, a portion of geological time of the greatest magnitude. Three eras are recognized: Paleozoic Era, Mesozoic Era, and Cenozoic Era. Because of the difficulties involved in establishing accurate chronologies, the Precambrian, or earliest, eras are classified independently. An era is composed of one or more geological periods. The stratigraphic, or rock, term that corresponds to "era" is "erathem."

ERA: see Equal Rights Amendment.

Era of———: see under substantive word or words (e.g., Good Feeling[s], Era of).

Érard, Sébastien (b. April 5, 1752, Strasbourg, Fr.—d. Aug. 5, 1831, near Passy), French piano and harp maker whose improvements in both instruments were largely responsible for their modern forms.

The son of a cabinetmaker, Érard was apprenticed to a harpsichord builder in Paris; there, about 1775, he invented a mechanical harpsichord and earned the patronage of the

Duchess of Villeroi. At a workshop on her estate he made the first French square piano (1777; a piano with a rectangular case and horizontal stringing). Thereafter, with his brother Jean-Baptiste, he opened his first shop, and success led to the opening of a London branch in 1786.

Eventually the business passed to Sébastien's nephew Pierre, who continued to enhance the firm's reputation with mechanical innovations. Among the Érard inventions were a novel grand piano action (key mechanism) that allowed quicker repetition of notes (1809), a double-action pedal harp that allowed greater ease of changing key while playing (1801–10), and new methods of constructing harp and piano frames. The firm had produced about 100,000 instruments by the end of the 19th century and pioneered in building harpsichords in the early 20th century.

eraser, piece of rubber or other material used to rub out marks made by ink, pencil, or chalk. The modern eraser is usually a mixture of vegetable oil, fine pumice, and sulfur bonded with rubber. The mix is processed, extruded, and vulcanized in rubber-processing equipment. In 1752 the *Proceedings* of the French Academy reported a suggestion for using caoutchouc, a vegetable gum produced by certain South American trees, to erase black lead marks. Caoutchouc was named rubber in 1770 by the English chemist Joseph Priestley, because it was used to rub out marks. The first patent on an integral pencil and eraser was issued in the United States to Joseph Rechenrdorfer of New York City on March 30, 1858.

Erasistratus of Ceos (fl. c. 250 BC), Greek anatomist and physician in Alexandria, regarded by some as the founder of physiology.

Known especially for his studies of the circulatory and nervous systems, Erasistratus noted the difference between sensory and motor nerves, but thought that the nerves were hollow tubes containing fluid. He believed that air entered the lungs and heart and was carried through the body in the arteries, and that the veins carried blood from the heart to the various parts of the body. He correctly described the function of the epiglottis and the valves of the heart, including the tricuspid, which he named.

Erasistratus was the first major exponent of pneumatism, which was based on the premise that life is associated with a subtle vapour called the pncuma.

Erasmus, SAINT, also called ELMO (d. 303?, Formia, Italy; feast day June 2), early Christian bishop, martyr, and one of the patron saints of sailors, who is romantically associated with Saint Elmo's fire (the glow accompanying the brushlike discharges of atmospheric electricity that appears as a tip of light on the masts of ships during stormy weather) as the visible sign of his guardianship over them. Erasmus is one of the Fourteen Holy Helpers, a group of saints jointly venerated in medieval Germany.

He is reported to have been bishop of Formia, where he was martyred, probably during the persecution of Christians by the Roman emperor Diocletian. According to Pope Gregory I (reigned 590–604), his relics were kept in the Cathedral of Formia. After the Saracens destroyed Formia in 842, Erasmus' body was transferred to Gaeta, Italy, where he is honoured as patron saint.

Several spurious acts have embellished his legend. According to these, he was a bishop in Syria who miraculously endured tortures under Diocletian in Lebanon, after which he was guided by an angel to Formia, where he performed many miracles. He has been confused with the Syrian St. Erasmus of Antioch;

some scholars propose that they are the same person. Later legends attest that he was martyred by being disemboweled; thus, as a Holy Helper, he was invoked by those suffering from intestinal maladies. Elmo is an Italian corruption (through Sant' Ermo) of St. Erasmus; other derivations include Ramus, Erasmus, Ermus, Ermo, and Telmo. His legendary narrative is in *Acta Sanctorum*.

Erasmus, Desiderius (b. Oct. 27, 1469, Rotterdam, Holland [now in The Netherlands]—d. July 12, 1536, Basel, Switz.), humanist who was the greatest scholar of the northern Renaissance, the first editor of the New Testament, and also an important figure in patristics and classical literature.

A brief treatment of Desiderius Erasmus follows. For full treatment, see MACROPAEDIA: Erasmus.

The son of Roger Gerard, a priest, and Margaret, a physician's daughter, Erasmus was reared in schools at Gouda, Deventer, and Utrecht, Holland. Later he was educated under the influence of the pietist *devotio moderna*, became an Augustinian canon, and was ordained a priest in 1492. Studies in Paris confirmed his dislike of Scholastic theology and brought him into contact with humanist groups. He visited England (1499–1500, 1505–06, 1509–14, and 1517), lectured at the universities of Oxford and Cambridge, and became well acquainted with Thomas More, John Fisher, and John Colet, who inspired him to study the Bible. Erasmus began to study Greek and visited Italy, where he widened his humanist contacts. He also spent four years at Louvain, Belg., six years at Freiberg, Ger., and the rest of his life in Basel, Switz.

The writings of Erasmus, covering a wide variety of topics, rank him as one of the greatest scholars of his time. The *Adagia* (1500; *Proverbs or Adagies*), published in Venice and containing more than 3,000 proverbs from the works of the classical authors, established his reputation, and the *Moriae encomium* (c. 1511; *The Praise of Folly*) and his edition of the New Testament (1516) ensured it.

Erastianism, doctrine that the state is superior to the church in ecclesiastical matters. It is named after the 16th-century Swiss physician and Zwinglian theologian Thomas Erastus, who never held such a doctrine. He opposed excommunication as unscriptural, advocating in its stead punishment by civil authorities. The state, he held, had both the right and the duty to punish all offenses, ecclesiastical as well as civil, wherever all the citizens adhered to a single religion. The power of the state in religious matters was thus limited to a specific area. Erastianism acquired its present meaning from Richard Hooker's defense of secular supremacy in *Of the laws of ecclesiastical polities* (1593–1662) and as a result of debates held during the Westminster Assembly of 1643.

Erastus, Thomas, original name THOMAS LÜBER, LIEBER, OF LIEBLER (b. Sept. 7, 1524, Baden, Switz.—d. Dec. 31, 1583, Basel), Swiss physician and religious controversialist whose name is preserved in Erastianism, a doctrine of church-state relationship that he himself never taught.

A student of philosophy and medicine for nine years, Erastus was invited in 1557 by the elector Otto Heinrich of the Palatinate to be professor of therapeutics in the new faculty of medicine at the University of Heidelberg. There he quickly achieved a favourable reputation as a physician and a teacher. As a supporter of the church reforms advocated by the Swiss theologian Huldrych Zwingli, Erastus became closely associated with the introduction of Reformed Protestantism into the Palatinate during the electorate of Frederick

III (1559–76). In debates over the Eucharist, the sacrament deriving from the Lord's Supper, he defended the Zwinglian view that Christ's body is present in the sacramental bread only symbolically, in contrast to Luther's view that his body is really present.

The central controversy in Erastus' life came to a head after he had opposed efforts by Calvinists in the Palatinate to impose the sys-

Erastus, portrait by Tobias Stimmer, 1582; in the Kunstmuseum, Basel, Switz.

By courtesy of the Öffentliche Kunstsammlung, Basel, Switz.

tem of church discipline that had been established by John Calvin at Geneva and elsewhere. When in 1568 a set of theses was presented at Heidelberg by the English Puritan George Withers, who affirmed both the presbyterian system of church government (assemblies of elected representatives) and the practice of excommunication, Erastus drew up 100 theses (later reduced to 75) to refute him. Erastus maintained that excommunication is unscriptural, that the sacraments should not be withheld from anyone genuinely wishing to receive them, and that in a Christian society—and Erastus explicitly limited his argument in this manner—the punishment of sins is in the hands of the civil magistrates. Because the Calvinists had the support of the elector, however, the presbyterian system was established by electoral decree in 1570.

For his opposition to the new order and also for alleged tendencies away from the doctrine of the Trinity toward Unitarianism, Erastus was excommunicated for two years. He was forced to leave Heidelberg when Lutheranism was reinstated under the elector Louis VI (1576–83). On his return to Basel, he was appointed professor of medicine there in 1580 and of ethics in 1582. The term Erastian evidently came into use first in 1643 in England; Presbyterians used it as a term of abuse for those who urged state supremacy.

The significance of Erastus' theses, which were published posthumously in 1589 under the title *Explicatio gravissimae quaestionis* . . . , was reflected by their numerous translations: in 1659 as *The Nullity of Church Censures*, in 1682 as *A Treatise of Excommunication*, and in 1844 in a Scottish edition. Erastus also wrote several medical and scientific treatises in which he attacked such popular superstitions as the belief in astrology and in alchemical transmutation of metals. He himself, however, shared the contemporary belief in witchcraft, which he opposed in his *Repetitio disputationis de lantiis seu strigibus* (1578; "Repetition of the Disputation Against Witches"), a defense of the use of the death penalty against witches and sorcerers.

Erato, in Greek religion, one of the nine Muses, the patron of lyric and erotic poetry or hymns. She is often depicted playing a lyre. See also MUSE.

Eratosthenes OF CYRENE (b. c. 276 BC, Cyrene, Libya—d. c. 194, Alexandria, Egypt), Greek scientific writer, astronomer, and poet, the first man known to have calculated the Earth's circumference.

At Syene (now Aswān), some 800 km (500 miles) southeast of Alexandria in Egypt, the Sun's rays fall vertically at noon at the summer solstice. Eratosthenes noted that at Alexandria, at the same date and time, sunlight fell at an angle of about 7° from the vertical. He correctly assumed the Sun's distance to be very great; its rays therefore are practically parallel when they reach the Earth. Given estimates of the distance between the two cities, he was able to calculate the circumference of the Earth. The exact length of the units (stadia) he used is doubtful, and the accuracy of his result is therefore uncertain; it may have varied by 0.5 to 17 percent from the value accepted by modern astronomers. He also measured the degree of obliquity of the ecliptic (in effect, the tilt of the Earth's axis) with great accuracy and compiled a star catalog. His mathematical work is known principally from the writings of Pappus of Alexandria.

After study in Alexandria and Athens, Eratosthenes settled in Alexandria about 255 BC and became director of the great library there. He worked out a calendar that included leap years, and he tried to fix the dates of literary and political events since the siege of Troy. His writings include a poem inspired by astronomy, as well as works on the theatre and on ethics. Eratosthenes was afflicted by blindness in his old age, and he is said to have committed suicide by voluntary starvation.

Erbil (Iraq): see Irbil.

erbium (Er), chemical element, rare-earth metal of transition Group IIIB of the periodic table. Erbium is a grayish silver element that also occurs as a series of pink compounds. It had limited commercial uses until the age of fibre-optic telecommunications, when it became an important constituent of the signal repeaters in long-distance telephone cables.

The element was discovered (1843) as an oxide by Carl Gustaf Mosander, who originally called it terbia. In the confusion arising from the similarity in the properties of the rare-earth elements, the names of two, terbium and erbium, became interchanged (c. 1860). The element occurs in many rare-earth minerals, among the more important being xenotime and euxenite. Erbium occurs also in the products of nuclear fission. Commercial purification is accomplished by ion-exchange methods. The metal itself has been prepared by thermoreduction of the anhydrous fluoride with calcium. It is slowly oxidized by oxygen and water. At low temperatures the element is antiferromagnetic, and at very low temperatures, ferromagnetic and superconductive. Natural erbium is a mixture of six stable isotopes: erbium-162 (0.136 percent), erbium-164 (1.56 percent), erbium-166 (33.41 percent), erbium-167 (22.94 percent), erbium-168 (27.07 percent), and erbium-170 (14.88 percent).

Erbium behaves as a typical trivalent rare-earth element, forming compounds such as the pink oxide Er₂O₃. The Er³⁺ ion is pink in solution and is strongly paramagnetic because of the presence of unpaired electrons. In addition, when raised to a high energy state by absorption of infrared light, the Er³⁺ ion emits photons at wavelengths of 1.55 micrometers—one of the wavelengths commonly employed in fibre-optic signal transmission. For this reason, erbium-doped fibre amplifiers are used to boost the power of light signals transmitted through long-distance optical cables.

atomic number	68
atomic weight	167.26
melting point	1,529° C
boiling point	2,862° C
specific gravity	9.066 (25° C)
valence	3
electronic config.	2-8-18-30-8-2 or (Xe)4f ¹² 5d ⁰ 6s ²

Erchomenos (Greece): see Orchomenus.

Ercilla y Zúñiga, Alonso de (b. Aug. 7, 1533, Madrid, Spain—d. Nov. 29, 1594, Madrid), Spanish soldier and poet, author of *La Araucana* (1569–89), the most celebrated Spanish Renaissance epic poem and the first epic poem about America.

Ercilla y Zúñiga received an excellent literary education before going to the New World in 1555. He distinguished himself in Chile in the wars against the Araucanian Indians and began the poem based on his experiences, which he finished after his return to Spain in 1563. *La Araucana* appeared in three installments in 1569, 1578, and 1589 and consisted of 37 cantos; two further cantos were added in 1590. The poem is weak in form, unity, relevance, and versification, but it excels in graphic descriptions, particularly of landscapes and fighting. It shows great sympathy for the brave resistance of the Araucanians.

Erckmann-Chatrrian, pseudonym of ÉMILE ERCKMANN and LOUIS-ALEXANDRE CHATRIAN (respectively b. May 20, 1822, Phalsbourg, France—d. March 14, 1899, Lunéville; b. Dec. 18, 1826, Soldatenthal, France—d. Sept.

Erckmann (left) and Chatrian
H. Roger-Viollet

3, 1890, Paris), two of the first French regionalist novelists in the 19th century.

The two men were close friends and decided to collaborate in writing novels that are essentially patriotic and popular in character. They chose as their heroes the people of their native province, Alsace, and based their plots on events in its history. Their first joint publication was a collection of short stories, *Contes fantastiques* (1847), and they established their reputation with the novels *L'illustre Docteur Mathéus* (1859), *Le Fou Yégo* (1862; "Crazy Yégo"), *Madame Thérèse* (1863), and *L'Ami Fritz* (1864; "Friend Fritz"). They often portrayed military life, as in *L'Histoire d'un Conscrit de 1813* (1864), about a man called to the colours (drafted) toward the end of the Napoleonic Wars, and in *Waterloo* (1865), in which they decry the horrors of war and advance their own pacifist views. Erckmann and Chatrian quarreled in 1889 and abandoned their partnership as a result.

Ercolano, formerly RESINA, town, Napoli provincia, Campania regione, southern Italy. It lies at the western foot of Mount Vesuvius, on the Gulf of Naples, just southeast of the city of Naples. The medieval town of Resina was built on the lava stream left by the eruption of Vesuvius (AD 79) that destroyed the ancient city of Herculaneum, from which the present name is derived. Ercolano is a resort and the starting point for excursions to the excavations of Herculaneum and for the ascent of Vesuvius by bus. The town also manufactures leather goods, buttons, glass, and the wine known as *Lacrime Christi* ("Tears of Christ"). Pop. (2004 est.) mun., 56,174.

Erdogan, Recep Tayyip (b. Feb. 26, 1954, Rize, Tur.), Turkish politician, who became prime minister of Turkey in 2003.

After playing with a professional football (soccer) team, Erdogan opted for politics and became active in parties led by Islāmic politi-

cian Necmettin Erbakan, despite a ban in Turkey on religiously based political parties. In 1994 Erdogan was elected mayor of Istanbul. The election of the first-ever Islāmist to the mayoralty shook the secularist establishment, but Erdogan proved to be a competent manager. In 1998, however, he was convicted of inciting religious hatred after reciting a poem that compared mosques to barracks and minarets to bayonets. Sentenced to 10 months in prison, Erdogan resigned as mayor. After serving four months, Erdogan was released in 1999, and he reentered politics. He helped form the Justice and Development Party, which won the parliamentary elections in 2002. Erdogan, however, was legally barred from serving in parliament or as prime minister because of his 1998 conviction. A constitutional amendment in 2002 effectively removed his disqualification, and on March 9, 2003, he won a by-election. After taking office on May 14, 2003, Erdogan sought to dispel fears that he held anti-Western biases. He also advanced Turkey's bid to join the European Union.

Erdős, Paul (b. March 26, 1913, Budapest, Hung.—d. Sept. 20, 1996, Warsaw, Pol.), Hungarian "freelance" mathematician and legendary eccentric, who was the most prolific mathematician of the 20th century.

Erdős had two sisters who contracted scarlet fever and died the day he was born. In reaction, his mother kept him home from school until the age of 10. With his father confined to a Russian prisoner-of-war camp for six years and his mother working long hours, Erdős passed the time flipping through his parents' mathematics books. At three he could multiply three-digit numbers in his head.

In 1930 Erdős entered the Péter Pázmány University in Budapest, where in four years he earned a Ph.D. in mathematics. As a college freshman, he made a name for himself in mathematical circles with a stunningly simple proof of Chebyshev's theorem, which says that a prime can always be found between any integer (greater than 1) and its double. Already, Erdős had definite ideas about mathematical elegance. He believed that God had a book that contained the shortest, most beautiful proof for every mathematical problem. His highest compliment was to say, "That's straight from The Book."

During his university years he and other young Jewish mathematicians championed a fledgling branch of mathematics called Ramsey theory, which has as its philosophical underpinning the idea that complete disorder is impossible. The Ramsey theorist conjectures that no matter how haphazard appearances, certain patterns must emerge.

In 1934 Erdős, disturbed by the rise of anti-Semitism in Hungary, left the country for a fellowship at the University of Manchester in England. In September 1938 he emigrated to the United States, accepting a one-year appointment at the Institute for Advanced Study in Princeton, N.J., where he cofounded the field of probabilistic number theory. During the 1940s he taught at a number of U.S. universities, spurning full-time job offers so that he would have the freedom to work with anyone at any time. Thus began half a century of nomadic existence that would make him a legend in the mathematics community. His wanderlust took him to Israel, China, Australia, and 22 other countries. Erdős would show up—often unannounced—on the doorstep of a fellow mathematician, declare "My brain is open!" and stay as long as his colleague served up interesting mathematical challenges.

With amphetamines to keep him going, Erdős did mathematics with a missionary zeal, often 20 hours a day, turning out some 1,500 papers, an order of magnitude higher than his most prolific colleagues produced. He turned mathematics into a social activity, encouraging his most hermetic colleagues to work to-

gether. In 1949 Erdős and Atle Selberg gave The Book proof of the prime number theorem. In 1951 John von Neumann presented the Cole Prize to Erdős for his work in prime number theory. In 1959 Erdős attended the first International Conference on Graph Theory, a field he helped found. During the next three decades he continued to do important work in combinatorics, partition theory, set theory, number theory, and geometry. In 1984 he won the Wolf Prize.

Erech, Sumerian URUK, Greek ORCHOË, modern TALL AL-WARKĀ', ancient Mesopotamian city located northwest of Ur (Tall Al-Muqayyar) in southeastern Iraq. The site has been excavated from 1928 onward by the German Oriental Society and the German Archeological Institute. Erech was one of the greatest cities of Sumer and was enclosed by brickwork walls about 6 miles (10 km) in circumference, which according to legend were built by the mythical hero Gilgamesh. Within the walls, excavations traced successive cities that date from the prehistoric Ubaid period, perhaps before 5000 BC, down to Parthian times (126 BC–AD 224). Urban life in what is known as the Erech–Jamdat Nasr period (c. 3500–c. 2900 BC) is more fully illustrated at Erech than at any other Mesopotamian city.

The two principal Sumerian divinities worshiped in ancient Erech appear to have been Anu (An), a sky god, and the goddess Inanna ("Queen of the Sky"). One of the chief landmarks of the city is the Anu ziggurat crowned by the "White Temple" of the Jamdat Nasr period. The temenos (sacred enclosure) of Eanna, another ziggurat, bore witness to the attention of many powerful kings, including Ur-Nammu (reigned 2112–2095 BC). Ur-Nammu also did much for the layout of the city, which then benefited from a Neo-Sumerian revival. Various architectural developments were associated with the Isin-Larsa period (c. 2017–1763) and with the Kassite period (c. 1595–c. 1157). Later rulers, including Cyrus the Great and Darius the Great, also built in the district of Eanna.

The city continued to prosper in Parthian times, when the last of an ancient school of learned scribes was still editing documents (c. 70 BC) in the cuneiform script.

Erechtheum, Ionic temple of Athena, built during 421–405 BC on the Acropolis at Athens, famous largely for its complexity and for the exquisite perfection of its details. The temple's Ionic capitals are the most beautiful that Greece produced, and its distinctive porch, supported by caryatid (*q.v.*) figures, is unequalled in classical architecture.

Erechtheum, on the Acropolis, Athens
Alison Frantz

The name, of popular origin, is derived from a shrine dedicated to the Greek hero Erichthonius. It is believed by some that the temple was erected in honour of the legendary king Erechtheus. The architect was probably Mnesicles. In the early 19th century, Lord Elgin took several sections of the temple to

London. Later, in the early 20th century, it was somewhat restored.

Erechtheus, legendary king and probably also a divinity of Athens. According to the *Iliad*, he was born from the corn land and raised by the goddess Athena, who established him in her temple at Athens. In later times only a great snake was thought to share the temple with Athena, and there is evidence that Erechtheus was or became a snake; that is, an earth or ancestor spirit.

The earliest Athenian kings tended to have similar names suggesting a connection with the earth (*chthōn*; e.g., Erichthonius, Erysichthon), to have been born of the earth, raised by Athena, and to have something serpentine about them. Snakes were often earth or ancestor spirits, so that Athena's sharing her temple with Erechtheus, whom she herself nurtured, may have been the mythical way of expressing her guardianship of the ancient royal house of Athens and of the land itself and its fertility, with which ancient kingship was intimately connected.

In his lost play *Erechtheus*, Euripides gave that king three daughters, one of whom was appropriately named Chthonia. At war with neighbouring Eleusis and its ally King Eumolpus, Erechtheus learned from the god Apollo that Athens would win if he sacrificed his daughter. He sacrificed Chthonia and won but apparently gained little by it, for he was destroyed by Poseidon or by a thunderbolt from Zeus.

erection, also called **PENILE ERECTION**, enlargement, hardening, and elevation of the male reproductive organ, the penis. Internally, the penis has three long masses of cylindrical tissue, known as erectile tissue, that are bound together by fibrous tissue. The two identical areas running along the sides of the penis are termed corpora cavernosa; the third mass, known as the corpus spongiosum, lies below the corpora cavernosa, surrounds the urethra—a tube that transports either urine or semen,—and extends forward to form the tip (or glans) of the penis. All three masses are spongelike; they contain large spaces between loose networks of tissue. When the penis is in a flaccid, or resting, state, the spaces are collapsed and the tissue is condensed. During erection, blood flows into the spaces, causing distention and elevation of the penis. The amount of blood entering the penis can be increased by physical or psychological stimulation. As blood enters, there is a temporary reduction in the rate and volume of blood leaving the penis. The arteries carrying blood to the penis dilate; this, in turn, causes tissue expansion. The veins leading from the penis have funnel-shaped valves that reduce the outflow of blood. As the erectile tissue begins to enlarge, the additional pressure causes the veins to be squeezed against the surrounding fibrous tissue, and this further diminishes the outflow of blood. Essentially, blood becomes temporarily trapped in the organ.

The corpus spongiosum does not become as erect as the corpora cavernosa. The veins are more peripherally located, so that there is a continual outflow of blood in this region. This constant circulation prevents the urethra from being collapsed by the adjacent tissue, which would prevent release of the semen.

The penis returns to its flaccid state when the arteries relax and begin to contract. Blood flow is once again reduced to its usual rate and volume. As blood drains from the erectile tissue spaces, pressure is reduced on the veins, and flow continues at its normal pace. *See also* ejaculation.

erector spinae, a deep muscle of the back; it arises from a tendon attached to the crest

along the centre of the sacrum (the part of the backbone at the level of the pelvis, formed of five vertebrae fused together). When it reaches the level of the small of the back, the erector divides into three columns, each of which has three parts. The muscle system extends the length of the back and functions to straighten the back and to rotate it to one side or the other.

Ereğli, town, south-central Turkey. It stands near the foot of the central Taurus Mountains on the northern approach to the Cilician Gates, a major pass. A frontier fortification of the Byzantine Empire, then known as Heraclea Cybistra, the town lay in the way of invading armies and was captured by the Arabs in 806 and again in 832. Near the end of the 11th century, it came under the Seljuq Turks; after their decline it was occupied by Mongols (13th century). The Turkmen Karaman dynasty followed the Mongols until their principality was annexed to the Ottoman Empire c. 1466. The Ulu Cami (Great Mosque) and a caravansary (hostelry), said to have been designed by the 16th-century court architect Sinan, are still standing. About 10 mi (16 km) south of Ereğli, near Ivriç, is a famous Hittite rock-cut bas-relief depicting the god Tarhun dispensing grain and grapes while being worshipped by the King of Tuvanuvu (Tyana; modern Bor).

Modern Ereğli lies on the Konya-Adana railway and is linked by road with both cities. It is a centre of cotton-textile manufacture based on cotton grown in the Adana plain. Pop. (1990) 74,283.

Ereğli, formerly **BENDER-EREĞLİ**, or **KARADENİZEREĞLİSİ**, town, northern Turkey, on the Black Sea coast. The town was founded about 560 BC as Heraclea Pontica by a colony of Megarians who soon subjected the native Mariandynians and extended their control over most of the coast. In 74 BC it sided with the Pontic king Mithridates VI the Great against the Romans, who captured and burned the town. Although rebuilt by the Romans, Heraclea Pontica did not recover its former prosperity. Taken by the Turks about AD 1360, it developed as a trading centre of the Genoese, who settled there in large numbers. A ruined citadel on a height overlooking the town is a remnant of that period. In the vicinity of Ereğli are three grottoes mentioned by Xenophon: through one of them, according to legend, Hercules descended into Hades to bring out Cerberus, the monstrous, three-headed watchdog of the lower world.

Ereğli basin lies in the richest coal-mining area of Turkey; some of the high-grade coal is exported through the town's port. Since 1965, with the completion of the first stage of giant integrated iron and steel mills, the town has become a centre of heavy industry. It is expected to satisfy all domestic demand for hot- and cold-rolled sheets, steel strips, and tin and to allow exports. Ereğli is linked by road with Zonguldak and by steamer with Istanbul. Pop. (1990) 63,987.

Eremita, Johannes: *see* Cassian, Saint John.

eremitic monasticism: *see* idiorhythmic monasticism.

Erenhot (China): *see* Erh-lien-hao-t'e.

Ereshkigal, in Mesopotamian religion, goddess in the Sumero-Akkadian pantheon who was Lady of the Great Place (*i.e.*, the abode of the dead) and in texts of the 3rd millennium BC wife of the god Ninazu (elsewhere accounted her son); in later texts she was the wife of Nergal (*q.v.*). Ereshkigal's sister was Inanna (Akkadian Ishtar), and between the two there was great enmity. In the rendezvous of the dead, Ereshkigal reigned in her palace, on the watch for lawbreakers and on guard over the fount of life lest any of her sub-

jects take of it and so escape her rule. Her offspring and servant was Namtar, the evil demon, Death. Her power extended to earth where, in magical ceremony, she liberated the sick possessed of evil spirits.

Ereshkigal's cult extended to Asia Minor, Egypt, and southern Arabia. In Mesopotamia the chief temple known to be dedicated to her was at Cuthah.

Eretna DYNASTY, dynasty that succeeded the Mongol Il-Khanid rulers in central Anatolia and ruled there from c. 1343 to 1380.

The dynasty's founder, Eretna, was an officer of Uighur (Uyghur) origin in the service of Demirtaş, the Il-Khanid governor of Anatolia, who revolted (1326) against the Il-Khanid ruler Abū Sa'īd and escaped to Egypt. Eretna then became governor of Anatolia under the suzerainty of Hasan the Elder, ruler of Azerbaijan. After Hasan the Elder was defeated by Hasan the Younger, son of Demirtaş, Eretna in 1337 received the protection of the Mamlūk sultan of Egypt. In 1343, however, Eretna defeated Hasan the Younger and emerged as an independent ruler over territories that included Niğde, Ankara, Amasya, Tokat, Samsun, and Erzincan; he made Sivas and later Kayseri his capital. Eretna was a scholarly man and a just ruler, whose people called him Köse Peygamber (Prophet with the Scanty Beard).

Under Eretna's successors, local rulers rebelled; the principality lost territories in the west to the Ottomans and the Karamans and in the east to the Turkmen Ak Koyunlu state. In 1380 Mehmed II, the last Eretna ruler, was killed, and Burhaneddin, a former vizier, proclaimed himself sultan over Eretna lands.

Eretria, ancient Greek coastal town of the island of Euboea. Jointly with its neighbour Chalcis, it founded Cumae in Italy (c. 750 BC), the first of the Greek colonies in the west; it then established colonies of its own in Chalcidice and Macedonia. Inter-city cooperation became competition, then conflict—the Lelantine War (*q.v.*; c. 700). Though it lost influence in the West, Eretria may have emerged from the war the stronger power, but by the classical period Chalcis had become the leading city of Euboea. In 499–498 five Eretrian triremes sailed to support the Ionian revolt against Persia, for which act Darius destroyed the city (490) and deported the population. The city was soon rebuilt, but under Macedonian and Roman rule it subsided into insignificance.

Excavations at the site (1890–95, 1900) have revealed a theatre, with much of the stage and several rows of seats preserved, a temple of Dionysus, an altar, a gymnasium, and a temple of Apollo Daphnephoros. The wall of the acropolis remains to the height of eight courses.

The modern village Néa Psará, which occupies the site, was populated by inhabitants of Psará, off Khíos, in 1821.

Erevan (Armenia): *see* Yerevan.

Erewash, district (borough), county of Derbyshire, England. It has an area of 37 sq mi (96 sq km). Its eastern boundary with Broxtowe (Nottinghamshire) is the River Erewash, from which the borough takes its name. It is bounded on the south by the Rivers Trent and Derwent, and to the west it extends as far as Derby and the River Derwent at Duffield. A major motorway passes through the borough, and there is a large railway freight terminal at Toton.

The domestic stocking and knitting industries of Ilkeston declined in the 18th century, but by the mid-19th century both hosiery and lace factories were in operation and the town was growing rapidly. In the same period coal mining expanded. The annual fair, granted by a charter of 1252, is held at Ilkeston in

October. Long Eaton was an agricultural community until the 19th century, when the development of a canal and later railways contributed to the growth of industry, particularly lace making (which collapsed in 1921). Today there is a wide range of industry, from heavy engineering to light crafts. Pop. (1991 prelim.) 104,000.

Erfurt, city, Thuringia *Land* (state), central Germany, located in the Thüringer Basin, on the Gera River. It was first mentioned in 724 as Erpesfurt, the site of an abbey and a royal residence at a ford (*Furt*) on the Gera (originally named Erpf) River. Boniface founded a bishopric there in 742. By 805 it was a military strong point and an administrative and commercial centre on the eastern border of the Frankish empire. It was granted municipal rights about 1250 by the archbishop of Mainz and controlled extensive territories in the Middle Ages. Joining the Hanseatic League in the 15th century, it was until about 1600 a great commercial centre for wool, a plant then used for its blue dye extract. Erfurt's university, opened in 1392, was suppressed in 1816. Occupied by a Swedish garrison during the Thirty Years' War (1618–48), the city became part of the electorate of Mainz in 1664. It passed to Prussia in 1802, forming part of Prussian Saxony until 1945, except for a period of French domination (1806–13). In 1808 the Congress of Erfurt was attended by Napoleon, Alexander I of Russia, and the kings of Bavaria, Saxony, Westphalia, and Württemberg. In 1850 a conference of the short-lived Prussian Union took place there.

The cathedral and the Church of St. Severus in Erfurt, Ger.

W. Krammisch—Bruce Coleman Inc.

The city is dominated by the cathedral and the Church of St. Severus, which stand side-by-side atop a hill called Domberg ("Cathedral Hill"). The cathedral (1154–1476) contains 15th-century glass and numerous notable works of art. Other buildings of interest in Erfurt include the Augustinian monastery where Martin Luther was a monk (1505–08), now an orphanage; the Krämerbrücke (1325; "Merchant Bridge"), lined with houses and shops; the Anger Museum of Art and History, located in a former merchant's house (1705–11); the palace of the governor of the electorate of Mainz (1711–20); the Teaching Institute (1953–59); and the Medical Academy (1954–59). There is a scientific library containing the Amplonian collection of 1400 and earlier, as well as a library of municipal archives, and a natural-history museum.

Erfurt is an important road and railway junction and a commercial centre, with an airport 3 miles (5 km) northwest. Industries include metalworking and the manufacture of electrical apparatus, shoes, and clothing. Known for the cultivation of a wide variety of flowers and vegetables—an industry that originated in the large gardens attached to the monasteries—it exports seeds and processed foods. Pop. (1993 est.) 203,134.

Erfurt Union Parliament, German *ERFURTER UNIONS PARLAMENT* (March 20–April 29, 1850), conference called by Prussia to form a union of German states headed jointly by

Prussia and Austria. Opposed by Austria, the plan failed to win the adherence of the other large German states and had to be renounced by Prussia in the Punctation of Olmütz on November 29.

The revolution of 1848–49 had forced the dissolution of the old Austrian-dominated German Confederation. In 1850 Prussia's chief minister, Joseph Maria von Radowitz, suggested the formation of a new union, in which Austria and Prussia would share leadership, and called a meeting of German states at Erfurt on March 20 to discuss the plan. Saxony and Hanover at first backed Prussia but withdrew when Bavaria and Württemberg failed to send representatives to the parliament. Meanwhile, Austria, which had no wish to accord Prussia equality with itself, sidetracked the Prussian plan by declaring the old confederation reconstituted. The Prussian rout was complete when Austria forced King Frederick William IV of Prussia to replace Radowitz with the more pro-Austrian Baron Otto von Manteuffel and to sign the Punctation of Olmütz, withdrawing its proposal.

Prussia's humiliation began an intense rivalry between the two German powers that ended with Austria's military defeat in 1866.

Erfurth, Hugo (b. Oct. 14, 1874, Halle, Brandenburg [Germany]—d. Feb. 14, 1948, Gaienhofen, W.Ger.), German photographer noted mainly for his portraits of artists, intellectuals, and celebrities of the 1920s.

Erfurth studied art (1892–96) at the Academy of Arts, Dresden. He worked at portrait photography in Dresden from 1896 until about 1925, when he began to produce photograms (shadowlike photographs made by placing an object between a light source and light-sensitive paper) and industrial photography. He worked in Cologne from 1934 to 1943 and in Gaienhofen from 1943 until his death. From 1924 to 1948 he was chairman of the jury of the prestigious Gesellschaft Deutscher Lichtbildner (GDL). His simple, natural use of light and his psychological insight into the character of each of his subjects combined with his mastery of the techniques of oil pigment printing to create a high standard for portraiture. Much of his extensive nonportrait work was destroyed during World War II.

erg, also called *SAND SEA*, in a desert region, area of large accumulation of sand, generally in the bottom of a huge basin in which a former river piled up alluvium. Ergs are areas of actively shifting dunes, "fossilized" dunes, or extensive sand sheets. The sand is generally loose and is extremely difficult to cross. In the Sahara Desert between Beni Abbès in Algeria and Ghadāmis in Libya, the Great Western and Great Eastern ergs are the most difficult of all Saharan areas and are generally avoided by modern trans-Saharan routes. The Libyan Desert is another extensive area of unmitigated sandy waste.

erg, unit of energy or work in the centimetre-gram-second system of physical units used in physics; to lift a pound weight one foot requires 1.356×10^7 ergs. It equals the work done by a force of one dyne acting through a distance of one centimetre and is equal to 10^{-7} joule, the standard unit of work or energy.

ergonomics: see human-factors engineering.

ergosterol, also called *PROVITAMIN D₂*, a white crystalline organic solid of the molecular formula $C_{28}H_{44}O$ belonging to the steroid family. It is found only in plants (e.g., yeasts and fungi) and is chemically related to cholesterol. Ergosterol is converted by ultraviolet irradiation into ergocalciferol, or vitamin *D₂*, a nutritional factor that promotes proper bone development in humans and other mammals.

Its relationship to vitamin D was established in 1927, when it was shown that an irradiated sample of ergosterol could be used to alleviate

'rickets, a deficiency disease of bone caused by lack of vitamin D in the diet. Commercially, ergosterol is produced from yeast and then converted into vitamin *D₂*, which is used as a food supplement. See also vitamin D.

ergot, fungal disease of cereal grasses, especially rye, caused by the ascomycete fungus *Claviceps purpurea*. In an ear of rye infected with ergot, a sweet, yellowish mucus is exuded for a time, followed by a loss of starch as the ear ceases growth. The ovaries then become permeated by the mycelium, a mass of fungal filaments, which in autumn forms the spur-like purple-black sclerotium.

The sclerotium constitutes the source of the drugs ergonovine, which is used in obstetrics to control postpartum hemorrhage, and ergotamine, which is used in treating migraine headaches. After an overdose of medications derived from ergot or after eating flour milled from ergot-infected rye, humans and livestock may develop ergotism, a condition sometimes called St. Anthony's Fire. The symptoms may include convulsions, miscarriages in females, and dry gangrene and may result in death. Ergot is also the source of lysergic acid, from which the powerful hallucinogen lysergic acid diethylamide (LSD) is easily synthesized.

erh-hu, Pinyin ERHU, also called *NAN-HU*, Chinese vertical fiddle, consisting of two strings, commonly tuned a fifth apart, which are stretched over a wooden drum resonator. A vertical post with no fingerboard goes through the resonator, and the bow is moved between the strings. Bowing is done horizontally, with right-hand fingering techniques for altering the bow tension and for crossing strings, while the instrument is held in an upright position on the thigh. In addition to its orchestral role, it is also a solo instrument. Its performance is characterized by subtle contrasts in bowing strength, powerful vibrato, and glissandos. A higher-pitched version with a smaller resonator surface is the *kao-hu*. In southern China, the *kao-hu* is often the first bowed-string instrument in orchestras, with the *er-hu* being the second. Several bass-range versions are also popular.

Erh Lake, Wade-Giles romanization ERH HAI, Pinyin ER HAI, lake in western Yunnan province, China. It lies in a deep basin at the eastern foot of the snow-covered Tien-t's'ang range between the upper waters of the Yangtze River, there called the Chin-sha River, and the Mekong River. Erh Lake is the last remnant of a larger lake, which formed the extensive alluvial plain surrounding it, particularly on the west side. It is drained from the southern end by the Yang-pi River, which flows into the Mekong. The lake is about 30 miles (50 km) long from north to south but only 6 to 10 miles (10 to 16 km) wide from east to west. The lake is about 6,365 feet (1,940 m) above sea level.

Erh Lake contains a number of islands. The south of the basin has comparatively easy communications to eastern Yunnan and to Szechwan province and is on the main route southwestward to Myanmar (Burma). The surrounding area was first brought under Chinese control during the Yüan dynasty in the late 13th century, before which the Erh Lake basin had been the centre of the independent states of Nanchao and, later, Ta-li.

Erh-lien-hao-t'e, Pinyin ERENHOT, city, Inner Mongolia autonomous *ch'ü* (region), China, in the Gobi (desert) near the border with Mongolia. Erh-lien-hao-t'e is located on the Trans-Mongolian railway. The town was elevated to city status in 1966 following the transfer of railroad wheel-change operations (necessary because of the different gauges used in Mongolia and China) from Chi-ning

on the Peking-Pao-t'ou railway line to the south. The city is a frontier settlement and a transshipment centre about 400 miles (640 km) southeast of Ulaanbaatar, Mongolia. Pop. (1998 est.) 10,270.

Erhard, Ludwig (b. Feb. 4, 1897, Fürth, Ger.—d. May 5, 1977, Bonn, W.Ger.), economist and statesman who, as economics minister (1949–63), was the chief architect of West Germany's post-World War II economic recovery.

Following World War I, Erhard studied economics, eventually joining an economics research institute. Because he was untainted by Nazi associations, he was entrusted by the postwar Allied occupation authorities with the reconstruction of industry in the Nürnberg-Fürth area. Thereafter he served successively as economics adviser in Middle and Upper Franconia, economics minister for Bavaria (1945–46), director of the Advisory Committee for Money and Credit (1947–48), and director of the economic council for the joint Anglo-U.S. occupation zone (1948–49). By the end of 1948 the currency reforms that he had instituted the preceding summer, coupled with the abolition of rationing and of other commercial restrictions, had already somewhat buoyed the prostrate German economy.

From September 1949, as economics minister of the new Federal Republic of Germany under Chancellor Konrad Adenauer, Erhard was commissioned to continue his policies of reconstruction. In the following years he applied his "social market system" to the problems of economic renewal with phenomenal results, achieving what has often been called the German "economic miracle." Based on free-market capitalism his system included special provisions for housing, farming, and social programs.

Erhard was appointed federal vice-chancellor in 1957 and succeeded Adenauer as chancellor in October 1963. His government was troubled by tepid foreign relations and a budget deficit. His decision to raise taxes in response to a slight recession in the summer of 1966 caused cabinet members to defect, and by the end of the year he was forced to resign. In 1967 he was named honorary chairman of the Christian Democratic Union.

erhu (musical instrument): see *erhu*.

Eric (personal name): see *under* Erik.

Ericales, order of flowering plants that belongs to the class Magnoliopsida (dicotyledons; characterized by two seed leaves). It comprises 8 families, some 160 genera, and about 4,500 species of mostly shrubs and small trees distributed in all areas of the world. They are widely distributed throughout the tropical and temperate regions of the Northern and Southern hemispheres, and a few genera extend into the Arctic and Antarctic regions. The Ericales include azaleas, rhododendrons, and heath plants, all prized for their flowers and abundant growth.

A brief treatment of Ericales follows. For full treatment, see *MACROPAEDIA: Angiosperms*.

The most common characteristic of the Ericales is the single integument of the ovule, the outer layer that becomes the seed coat. Other features, less constant in this order, include the shrub habit, simple and leathery leaves, perfect flowers (male and female components in the same flower), and pollen that is shed in the four-grouped form.

Bogs and peaty soils with a high sand content are favourite habitats for many members of the Ericales; when planted in rock gardens, well-drained, moist soil with a high organic content is required. Rhododendrons and many members of the heath family (Ericaceae) do not thrive on clay soils or on limestone.

The Ericaceae family is widely distributed, extending into the subarctic and along mountain chains through the tropics. It is by far the most important family of the Ericales; a large percentage of its approximately 110 genera and 4,000 species are under cultivation. There are more than 800 species of *Rhododendron* (which includes the azaleas). Many Himalayan species, in a variety of beautiful colours, are now grown in warmer temperate regions.

Although azaleas, with funnel-form flowers, can be distinguished visually from taller rhododendrons, with bell-shaped flowers and evergreen leaves, no clear distinction between these two groups is possible on the basis of floral and vegetative analyses; azaleas are included in the genus *Rhododendron*. Other ornamental genera include *Calluna* (heather of northern climates), *Erica* (heaths of southern climates), *Kalmia* (mountain laurel), and *Pieris* ("andromeda").

Cultivars (horticultural varieties) of the genus *Vaccinium*, derived largely from the highbush blueberries *V. corymbosum* and *V. ashei*, support a major industry in the eastern United States. In New England and maritime Canada native populations of the low-growing blueberries cover marginally productive lands.

The other families of the Ericales have distinctive distributions and contain a wide variety of species. After Ericaceae, the next largest family is Epacridaceae, with 30 genera and some 400 species of small trees and shrubs, found primarily in Australia and New Zealand, with a few species in Southeast Asia and South America. The other families in the order are relatively small and include Cyrillaceae, Clethraceae, Grubbiaceae, Empepraceae (the crowberry family), Pyrolaceae (the shinleaf family), and Monotropaceae (the Indian pipe family), which is almost entirely saprophytic, living off decaying vegetable matter with the aid of fungi.

Threadlike cells (hyphae) of soil fungi belonging to the mushroom and related groups of molds envelop the roots of the Monotropaceae and many other members of the Ericales. Outer layers of roots, changed in structure by this association with fungi, are known as mycorrhizae. This arrangement aids in the absorption of mineral nutrients and organic substances by the host plants.

The production of seeds is the primary method of reproduction in the Ericales. Inflorescences are usually borne at the ends of branches in elongate, often branched clusters. Species of many families bear a single flower just above the juncture of leaf and stem. A generalized flower of the Ericales possesses sepals, white- or pink-coloured petals, stamens, and a pistil within the same flower. The ovary is superior (flower parts arise below the ovary). Five sepals are joined basally to form a green calyx, and the five petals of the corolla are separate from each other. Stamens occur in two whorls when they number 10. The ovary of the pistil contains many ovules in each of the five chambers; a single style and stigma arise above the ovary.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Erice, formerly (until 1934) MONTE SAN GIULIANO, town, Trapani *provincia*, northwestern Sicily, Italy; it lies at 2,464 feet (751 m) above sea level on the top of Monte San Giuliano (also called Monte Erice), just northeast of Trapani city. The town originated as a settlement of the Elyrir (an ancient Sicilian tribe) and was fortified by the Phoenicians and contested by the Carthaginians and Romans. Known in antiquity as Eryx, it was famous throughout the Mediterranean for the temple of Venus Erycina, which grew out of a local

Greek cult of Aphrodite. Later occupied by the Saracens, the town was conquered in the 11th century by the Norman count Roger I of Sicily, who called it Monte San Giuliano. Although the town is primarily medieval in character, ancient remains include cyclopean walls with Phoenician inscriptions and fragments of the celebrated temple. The principal church is the Chiesa Matrice (1314), with a portico from 1426 and a detached tower from 1312.

Local occupations are stockbreeding and vine cultivation. Pop. (2001 prelim.) 25,251.

Ericson, Leif: see Leif Eriksson.

Ericsson, John (b. July 31, 1803, Långban-shyttan, Sweden—d. March 8, 1889, New York, N.Y., U.S.), Swedish-born American naval engineer and inventor who built the first armoured turret warship and developed the screw propeller.

Ericsson, detail of an oil painting by Charles Loring Elliott; in the Science Museum, London

By courtesy of the Science Museum, London

After serving in the Swedish army as a topographical surveyor, Ericsson went to London in 1826 and constructed a steam locomotive, the *Novelty*, for a railway competition at Rainhill, Lancashire, in 1829. The prize was won by George Stephenson's *Rocket*. Ericsson also devised a plan for placing warship engines below the waterline to protect them against shell fire. In 1833 he exhibited his calorific engine, on which he worked the rest of his life, and in 1836 he patented a screw propeller, first used in 1837 on the *Francis B. Ogden*, built in London. Captain Robert F. Stockton, of the U.S. Navy, ordered a small iron vessel, the *Robert F. Stockton*, to be fitted by Ericsson with engines and screw; it reached New York City in May 1839.

A few months later, Ericsson emigrated to the United States and lived the rest of his life in New York City, becoming a naturalized citizen in 1848. During the American Civil War, Ericsson's proposal to the Navy Department for a novel warship was accepted, and the *Monitor* was launched on Jan. 30, 1862. Wholly steam-powered and with a screw propeller, the vessel, with its armoured revolving turret, set a revolutionary pattern for warships that continued into the 20th century. On March 9 the *Monitor* fought the Confederate ironclad *Virginia* (formerly *Merrimack*), leading the federal government to place an order with Ericsson for many more monitor-type vessels; these ships played an important role in the blockade of the Confederacy. In later years he developed a torpedo and investigated solar-powered motors.

Eridu, ancient Sumerian city south of modern Ur (Tall al-Muqayyar), Iraq. Eridu was revered as the oldest city in Sumer according to the king lists, and its patron god was Enki (Ea), "lord of the sweet waters that flow under the earth." The site, located at a mound called Abū Shahrāy, was excavated principally between 1946 and 1949 by the Iraq Antiquities Department; it proved to be one of the most important of the prehistoric urban centres in

southern Babylonia. Founded on sand dunes probably in the 5th millennium BC, it fully illustrated the sequence of the preliterate Ubaid civilization, with its long succession of superimposed temples portraying the growth and development of an elaborate mud-brick architecture.

The city continued to be occupied to about 600 BC but was less important in historic periods.

Eridu Genesis, in Mesopotamian religious literature, ancient Sumerian epic primarily concerned with the creation of the world, the building of cities, and the flood. According to the epic, after the universe was created out of the primeval sea and the gods were given birth, the deities in turn fashioned man from clay to cultivate the ground, care for flocks, and perpetuate the worship of the gods.

Cities were soon built and kingship was instituted on Earth. For some reason, however, the gods determined to destroy mankind with a flood. Enki (Akkadian Ea), who did not agree with the decree, revealed it to Ziusudra (Utnapishtim), a man well known for his humility and obedience. Ziusudra did as Enki commanded him and built a huge boat, in which he successfully rode out the flood. Afterward, he prostrated himself before the gods An (Anu) and Enlil (Bel), and, as a reward for living a godly life, Ziusudra was given immortality.

Erie,⁴ Iroquoian-speaking North American Indians who inhabited most of what is now northern Ohio, parts of northwestern Pennsylvania, and western New York; they were often referred to as the Cat Nation. Little is known of their social or political organization, but early Jesuit accounts record that the Erie had many permanent, stockaded towns, practiced agriculture, and comprised several divisions. Erie traditions told of numerous wars with tribes of the Iroquois confederacy; the final conflict occurred between 1653 and 1656, with the Erie being forced to capitulate when their bows and poisoned arrows were unable to withstand the guns supplied to the Iroquois by Dutch and English traders. Some of the surviving Erie fled to other tribes, but most were captured by the Iroquois and adopted as a constituent tribe.

Erie, city, seat (1803) of Erie county, northwestern Pennsylvania, U.S., port of entry on Lake Erie. Named for the Erie Indians, it was the site of the Fort-Presque-Isle built by the French (1753) on a 6-mi (10-km) peninsula (now Presque Isle State Park) enclosing a fine natural harbour. Abandoned to the British in 1759, the fort was destroyed by Indians during the Pontiac Conspiracy of 1763. The area remained a wilderness until after the American Revolution when it was purchased by Pennsylvania from the federal government. A U.S. Ft. Presque Isle was built in 1795, and at the same time the town was laid out by Gen. Andrew Ellicott, U.S. surveyor general, and Gen. William Irvine. Naval yards established on Presque Isle Bay built most of the fleet that was used by Commo. Oliver H. Perry to defeat the British at the Battle of Lake Erie (Sept. 10, 1813). The restored hull of Perry's flagship, *uss "Niagara,"* lies at the foot of State Street.

Economic development began with the opening (1844) of the Erie and Pittsburgh Canal and railway construction in the 1850s. Erie is Pennsylvania's only port on the St. Lawrence Seaway and is a strategic shipping point for lumber, coal, petroleum, grain, chemicals, and iron. Early industries were largely agricultural. Erie's first iron foundries used bog ore from the bay swamps. Manufactures are now well diversified and include electrical equipment, construction machinery, ships, paper, railroad equipment, aluminum forgings, clothing, chemicals, plastics, and rubber products. Erie

is the seat of Gannon (1944), Mercyhurst (1926), and Villa Maria (1925) colleges, and the Behrend College campus of Pennsylvania State University.

The Perry Memorial House and Dickson Tavern (1809) was a station on the Underground Railroad for runaway slaves; it was restored in 1963. The Wayne Blockhouse on the grounds of the Pennsylvania Soldiers' and Sailors' Home is a replica of the one in which Gen. Anthony ("Mad Anthony") Wayne died on Dec. 15, 1796; a flagpole marks the spot where he was buried (his remains were later removed to Radnor, near Philadelphia). Fort-Le-Boeuf, the last French outpost in the French and Indian Wars, is 16 mi south. Inc. borough, 1805; city, 1851. Pop. (1990) city, 108,718; Erie MSA, 275,572.

Erie, Lake, fourth largest of the five Great Lakes of North America. It forms the boundary between Canada (Ontario) to the north and the United States (Michigan, Ohio, Pennsylvania, and New York) to the west, south, and east. The major axis of the lake extends from west-southwest to east-northeast for 241 mi (388 km), and the lake has a maximum width of 57 mi. The total area of the lake's drainage basin is 22,690 sq mi (58,770 sq km), exclusive of surface area, which is 9,910 sq mi. The lake's principal tributary rivers are the Detroit (carrying the discharge of Lake Huron), Huron, and Raisin rivers of Michigan; the Maumee, Portage, Sandusky, Cuyahoga, and Grand rivers of Ohio; the Cattaraugus Creek of New York; and the Grand River of Ontario. The lake discharges at its eastern end through the Niagara River, and its western end contains all of the islands, the largest being Pelee Island, Ont. With a mean surface height of 570 ft (170 m) above sea level, Erie has the smallest mean depth (58 ft) of the Great Lakes, and its deepest point is 210 ft. Storms frequently cause short-period fluctuations in lake level that can amount to several feet at the ends of the lake. It is an important link in the St. Lawrence Seaway. The New York State Barge Canal has an outlet at Tonawanda, N.Y., on the Niagara River, and one of its branches enters Lake Erie at Buffalo.

Originally, a few harbours on the lake were formed by natural bays, but most of them are at the mouths of streams that were improved by protective piers and breakwaters and by dredging to accommodate the large lake vessels. The industrial economy of the lakeshore area depends heavily upon water transportation. The important steel industry (notably,

to the south at Pittsburgh) depends upon the movement of iron ore and limestone across the Great Lakes to Lake Erie ports (mostly to the Ohio ports of Cleveland, Ashtabula, and Conneaut). The port at Toledo, Ohio, handles soft-coal shipments, and Buffalo is an important grain port. Other prominent ports are Sandusky, Huron, Lorain, and Fairport Harbor (in Ohio), Erie (in Pennsylvania), and Port Colborne (in Ontario). Intense pollution of the lake resulted in the closing of many beaches and resorts in the 1960s, but by the late 1970s the environmental damage had begun to be arrested. The Point Pelee National Park lies on the northwestern shore in southern Ontario.

The first European to see Lake Erie, when the Iroquois Indians inhabited the region, was probably the French-Canadian explorer Louis Jolliet, in 1669, although some credit the French man Étienne Brûlé with its exploration as early as 1615. The British, allied with the Iroquois, developed trade along Lake Erie in the late 17th century. British pressure led to the takeover of two strategic French forts, in 1759 (Fort-Conti, thereafter Ft. Niagara) and in 1760 (Fort-Pontchartrain-du-Détroit, thereafter Ft. Detroit). Many British Loyalists then moved north of the lake into Ontario, and the American shores were not settled until after 1796. In the Battle of Lake Erie, an important engagement of the War of 1812, U.S. commodore Oliver H. Perry defeated a British squadron at Put-in-Bay, Ohio, and secured the Northwest for the United States. The lake was named after the Erie Indians who once inhabited the shores.

Erie Canal, historic waterway of the United States connecting the Great Lakes with New York City via the Hudson River. By the beginning of the 19th century the desirability of a transportation link between the Atlantic coast and the trans-Allegheny region was evident. Gov. DeWitt Clinton of New York saw the potential in the proposal for a canal from Buffalo, on the eastern shore of Lake Erie, to Albany, on the upper Hudson, passing through the gap in the mountains in the Mohawk Valley region. In 1817 he induced the state legislature to authorize the expenditure of \$7,000,000 for construction of a canal 363 mi long, 40 ft wide, and 4 ft deep (584 km long, 12 m wide, and 1.2 m deep). To cross the 500-ft rise in elevation west of Troy, the work required 82 locks. No roads ex-

"Junction of the Erie and Northern Canals," aquatint by John Hill, c. 1830-32

isted for supply; horse and man power alone were available. Streams were crossed on aqueducts; in several places rock was blasted with black-powder charges. Despite all difficulties, the canal was opened on Oct. 25, 1825, by the canal boat *Seneca Chief*.

The effect of the canal on the growth of the upper Midwest was rivaled only by its effect on the growth of New York City. Settlers poured west (many using the canal) into Michigan, Ohio, Indiana, and Illinois, whence they could ship back farm produce via the Erie Canal to be marketed in the East; in return, bargeloads of manufactured goods and supplies went west. Freight rates from Buffalo to New York City, which had been \$100 a ton by land, were only \$10 a ton by the canal; in nine years the tolls exceeded the cost of construction, and by 1882, when the tolls were abolished, the canal had paid for the cost of several feeder canals and contributed to the general revenue of the state.

Enlarged to 70 feet (21 m) in width and 7 feet (2.1 m) in depth, the canal successfully resisted competition from the railroads and, despite suffering a period of neglect late in the 19th century, was the central artery in the 20th-century development of New York canals that connected Lake Champlain, Lake Ontario, and the Finger Lakes. The canal is capable of accommodating barges of up to 2,200 tons (1,996 metric tons) capacity. See also New York State Barge Canal System.

Erie Railroad Company, U.S. railroad running between New York City, Buffalo, and Chicago, through the southern counties of New York state and skirting Lake Erie. It was incorporated in 1832 as the New York and Erie Railroad Company, to build from Piermont, N.Y., on the west bank of the Hudson River, to Dunkirk on Lake Erie. The track was completed in 1851.

The Erie became known as "the scarlet woman of Wall Street" in the mid-19th century when it was the object of financial struggles between Daniel Drew, Jay Gould, James Fisk, and Cornelius Vanderbilt. Drew became a director of the Erie in 1857 and used his position to manipulate the value of Erie stock to his own advantage. In 1868 Vanderbilt tried to gain control of the line by cornering its stock. Drew, in an alliance with Gould and Fisk, manufactured 50,000 shares of Erie stock and dumped them on the market. When a court ordered their arrest, they fled to a hotel in Jersey City. Gould was able to bribe legislators in Albany to secure passage of a bill legalizing what they had done. After making peace with Vanderbilt, Gould and Fisk were left in control of the Erie. They used it as a base for new exploits in stock watering and financial chicanery that led to the panic of 1869.

The Erie went bankrupt four times in its history. It had the disadvantage of competing with other railroads between the Midwest and the east coast. In the 1870s a fierce rate war took place between the Erie, the Baltimore and Ohio, the Grand Trunk, the New York Central, and the Pennsylvania railroads, ending in bankruptcy for the Erie.

The line passed through a number of reorganizations until it merged with the Delaware, Lackawanna and Western Railroad Company in 1960 to become the Erie Lackawanna Railway Company. Before merger, the Erie had operated 2,300 miles (3,700 km) of track. The merger eliminated duplicating track, resulting in a 2,900-mile road. Despite this, the Erie Lackawanna became bankrupt in 1972 and was taken over by Consolidated Rail Corporation (*q.v.*; Conrail) in 1976.

Erigena, John Scotus, also called **JOHANNES SCOTUS ERIUGENA** (b. 810, Ireland—d. c.

877), theologian, translator, and commentator on several earlier authors in works centering on the integration of Greek and Neoplatonist philosophy with Christian belief.

From about 845, Erigena lived at the court of the West Frankish king Charles II the Bald, near Laon (now in France), first as a teacher of grammar and dialectics. He participated in theological disputes over the Eucharist and predestination and set forth his position on the latter in *De predestinatione* (851; "On Predestination"), a work condemned by church authorities. Erigena's translations of the works of Pseudo-Dionysius the Areopagite, St. Maximus the Confessor, St. Gregory of Nyssa, and St. Epiphanius, commissioned by Charles, made those Greek patristic writings accessible to Western thinkers.

Erigena's familiarity with dialectics and with the ideas of his theological predecessors was reflected in his principal work, *De divisione naturae* (862–866; "On the Division of Nature"), an attempt to reconcile the Neoplatonist doctrine of emanation with the Christian tenet of creation. The work classifies nature into (1) that which creates and is not created; (2) that which creates and is created; (3) that which does not create and is created; and (4) that which does not create and is not created. The first and the fourth are God as beginning and end; the second and third are the dual mode of existence of created beings (the intelligible and the sensible). The return of all creatures to God begins with release from sin, physical death, and entry into the life hereafter. Man, for Erigena, is a microcosm of the universe because he has senses to perceive the world, reason to examine the intelligible natures and causes of things, and intellect to contemplate God. Through sin man's animal nature has predominated, but through redemption man becomes reunited with God.

Though highly influential upon Erigena's successors, notably the Western mystics and the 13th-century Scholastics, *De divisione naturae* eventually suffered condemnation by the church because of its pantheistic implications. The works of Erigena are in J.-P. Migne's *Patrologia Latina*, Vol. 122.

Erigone, in Greek mythology, daughter of Icarus, the hero of the Attic deme (township) of Icaria. Her father, who had been taught by the god Dionysus to make wine, gave some to several shepherds, who became intoxicated. Their companions, thinking they had been poisoned, killed Icarus and buried him under a tree. Erigone, guided by her dog Maera, found his grave and hanged herself on the tree. Dionysus sent a plague on the land, and all the maidens of Athens, in a fit of madness, hanged themselves. Icarus, Erigone, and Maera were set among the stars as Boötes (or Arcturus), Virgo, and Procyon, and to propitiate Icarus and Erigone, the festival called Aiora (the Swing) was instituted. During this festival various small images (Latin *oscilla*) were swung from trees, and offerings of fruit were made. The story of Erigone was probably intended to explain the origin of the *oscilla*.

Erik, also spelled **ERIC**, name of rulers grouped below by country and indicated by the symbol ●.

DENMARK

● **Erik V**, byname **ERIK GLIPPING**, or **KLIPPING** (b. c. 1249, Denmark—d. Nov. 22, 1286, Finderup, Den.), king of Denmark (1259–86) whose reign saw the expansion of the power of the great nobles and prelates, formalized by the royal charter of 1282, and the restoration of Danish sovereignty in Schleswig (southern Jutland).

The son of Christopher I, Erik succeeded to the throne in 1259 after the murder of his father during a power struggle with Archbishop Jakob Erlandsen. In 1261 the royal army was defeated by forces in Schleswig and Holstein organized by Erlandsen, and Erik and the queen mother were taken prisoner. Released in 1264 through the intervention of the pope and of German princes, he was declared of age in 1266.

After the death of his cousin Erik, Duke of Schleswig, in 1272, Erik gained control of Schleswig and in 1276, against the opposition of the magnates, had his son Erik VI Menved recognized as his successor. The great nobles, however, steadily increased their power, and in 1282 they forced Erik to grant Denmark's first royal charter, the *haandfaestning*, which protected the nobility from arbitrary imprisonment and forced the king to call a yearly meeting of the nobles' and prelates' assembly, the *hof* (Latin *parlamentum*), which had been meeting periodically since the reign of Valdemar II 50 years earlier. The *haandfaestning*, Denmark's first written constitution, marked a loss of power for the peasantry and for the provincial *things* (assemblies) and enabled the magnates to carry out sweeping reforms in domestic and foreign policy in the remaining years of Erik's reign. He was murdered in 1286.

● **Erik VI**, byname **ERIK MENVED** (b. 1274, Denmark—d. Nov. 13, 1319, Denmark), king of Denmark (1286–1319) under whom the conflict between church and monarchy, which had first arisen during the rule of his grandfather Christopher I, reached its peak and was tenuously resolved. Erik's attempts to renew Danish conquests along the southern Baltic coast greatly weakened the country's finances and aroused opposition to his rule.

The son of Erik V, Erik succeeded to the Danish throne in 1286 after the murder of his father. His rule was soon challenged by several magnates who had been found guilty—probably unjustly—of killing his father and had been outlawed in 1287. These outlaws, who were aided by the Norwegian king and soon joined by Duke Valdemar of Schleswig and the new archbishop, Jens Grand, raided the Danish coasts. Erik defeated Valdemar and reached an agreement with Norway in 1295, but he continued to feud with Grand, whose imprisonment led to a papal interdict of the king in 1297.

Erik's settlement with Pope Boniface VIII (1303) enabled him to resume Danish conquests along the northern border of the Holy Roman Empire, and in 1304 the emperor Albert I ceded to Denmark all lands north of the Elbe River. Toward the end of his reign, Erik lost the allegiance of most of his German vassals and retained only Rostock and Rügen. The final years of his reign were plagued by renewed conflict with Norway and Sweden and growing opposition from the church, peasants, and nobles, including his brother and successor, Christopher. The financing of Erik's military campaigns almost bankrupted Denmark, and Erik was forced to mortgage large areas of the kingdom to raise funds. He died childless.

● **Erik VII**, also called **ERIK OF POMERANIA**, Danish **ERIK AF POMMERN**, Swedish and Norwegian **ERIK AV POMMERN** (b. c. 1381, Pomerania—d. c. June 1459, Rügenwalde, Pomerania [now Darlowo, Pol.]), king of the united realms of Denmark, Norway (as Erik III), and Sweden (as Erik XIII) from 1397 to 1439; his autocratic rule and foreign wars eventually lost him the throne in all three of his dominions.

The son of Duke Vratislav VII of Pomerania and the great-nephew of Margaret, queen of the three united Scandinavian realms, Erik was adopted by Margaret in 1387. Her skillful diplomacy won him the throne of the three

realms (the Kalmar Union) in 1397, but she continued as effective ruler until her death in 1412.

Erik soon set out to establish a powerful Scandinavian Baltic empire, based in Denmark. Supported by the Danish diet (1413) and the German king Sigismund (1424), he launched two wars (1416–22, 1426–35) against the counts of Holstein to regain control of Schleswig. The Holsteiners were joined in 1426 by the north German trading towns of the Hanseatic League, whose trading interests were threatened by Erik's preferential policy toward Danish merchants and artisans. Although Schleswig was completely lost to the Holstein-Hanseatic coalition by 1432, Erik defeated Hanseatic fleets and imposed the first tolls (1428) on ships plying the strait between Denmark and Sweden.

Erik's favouritism toward Danes in his official appointments and his war financed by heavy taxes meanwhile had aroused opposition in Norway and Sweden and among the Danish peasants. When a Hanseatic blockade stopped Swedish exports of iron and copper in 1434, Swedish miners revolted. Leading Swedish nobles exploited the conflict and won the support of the Danish council of state in demanding that Erik institute a new union with constitutional forms of government. When Erik refused, he was deposed in Denmark, Sweden (1439), and Norway (1442) and was succeeded by Christopher III of Bavaria in all three of his realms. From his exile on the Baltic island of Gotland, Erik tried to regain the throne until 1449, when he withdrew to Pomerania.

NORTHUMBERLAND

• **Erik:** see Erik I (Norway).

NORWAY

• **Erik I**, byname **ERIK BLOODAX**, Norwegian **EIRIK BLODØKS** (d. 954, Stainmore, Eng.), king of Norway (c. 930–935) and later king of Northumberland (948, 952–954). On the death of his father, Harald I Fairhair, first king of united Norway, Erik attempted to make himself sole king of Norway, defeating and slaying two of his brothers to whom vassal kingdoms had been assigned by their father; but his tyranny fostered the reaction that had set in against the strong rule of Harald. Another son, Haakon, who had been brought up in England, was invited to Norway by dissident nobles and succeeded in ejecting Erik.

Much later Erik turned up in Northumbria, once a Viking stronghold but at this time under English overlordship; there he established himself as king in 948 but was driven out the same year. In 952 he returned, only to be expelled again in 954, when King Eadred of England took the Northumbrian kingdom into his own hands. Erik was slain the same year at Stainmore. With his expulsion, the line of Norse kings in York ended.

• **Erik III:** see Erik VII (Denmark).

SWEDEN

• **Erik XIII:** see Erik VII (Denmark).

• **Erik XIV** (b. Dec. 13, 1533, Stockholm, Sweden—d. Feb. 26, 1577, Örbyhus), king of Sweden (1560–68) who expanded the powers of the monarchy and pursued an aggressive foreign policy that led to the Seven Years' War of the North (1563–70) against Denmark.

Succeeding his father, Gustav I Vasa, in 1560, Erik soon obtained passage of the Articles of Arboga (1561), curtailing the powers of his half brothers, who had been granted large duchies by Gustav I. He consolidated his authority by establishing a special royal court of appeal and installing a new constitution (1562) that defined the nobility's military obligations.

Erik's major foreign policy objective was to free Sweden's Baltic Sea trade from Danish

control. He first sought allies in western Europe, unsuccessfully bidding for the hand of Elizabeth I of England. Realizing the advantage of controlling ports on the eastern Baltic

Erik XIV; detail from a portrait by S. von der Meulen, 1561; in Gripsholm Castle, Sweden

By courtesy of the Svenska Portrattarkivet, Stockholm

coast, he obtained sovereignty (1561) over Reval (now Tallinn, Estonia) and its adjacent territories. Meanwhile, his half brother John, duke of Finland, also sought a foothold in the east and signed a treaty with Sigismund II Augustus, king of Poland, agreeing to marry the king's daughter against Erik's wishes. Erik imprisoned John and his wife the following year.

Erik's acquisitions in Estonia alarmed Frederick II, king of Denmark and Norway, who allied with Lübeck and Poland and declared war in 1563, initiating the Seven Years' War of the North. The Swedish king led his forces with moderate effectiveness and was able to gain a stalemate with Denmark in the first years of the war. His fear of treason caused his judgment to break down in 1567, and he ordered the killing of the powerful Sture family's leading members. His adviser, Jöran Persson, was imprisoned for the crime.

After regaining his mental composure, Erik restored the hated Persson; he then had his commoner mistress, Karin Månsdotter, crowned queen over the objections of the nobility. Duke John (later King John III), who was liberated in 1567, joined with his brother, the future Charles IX of Denmark and Norway, and deposed Erik in 1568. Erik died in prison.

ERIK THE RED, byname of **ERIK THORVALDSON**, Norwegian **EIRIK RAUDE**, or **EIRIK TORVALDSSON** (fl. late 10th century, Norway), founder of the first European settlement on Greenland (c. 986) and the father of Leif Eriksson, one of the first Europeans to reach North America.

As a child, Erik left his native Norway for western Iceland with his father, Thorvald, who had been exiled for manslaughter. In the Scandinavian style of the time he was known as Erik Thorvaldson and in his youth was nicknamed Erik the Red. When Erik was similarly exiled from Iceland about 980, he decided to explore the land to the west (Greenland). That land, visible from the mountaintops of western Iceland, lay across 175 miles (280 km) of water; it had been skirted by the Norwegian Gunnbjörn Ulfsson earlier in the 10th century. Erik sailed in 982 with his household and livestock but was unable to approach the coast because of drift ice. The party rounded the southern tip of Greenland and settled in an area near present Julianehåb (Qaqortoq). During the three-year period of Erik's exile, the settlers encountered no other people, though they explored to the northwest, discovering Disko Island (now Qeqertarsuaq).

Erik returned to Iceland in 986. His descriptions of the territory, which he named Greenland, convinced many people anxious for more habitable land to join a return expedition. Of the 25 ships that sailed from Iceland,

only 14 ships and 350 colonists are believed to have landed safely at an area later known as Eystribyggð (Eastern Colony). By the year 1000 there were an estimated 1,000 Scandinavian settlers in the colony, but an epidemic in 1002 considerably reduced the population. Erik's colony, commemorated in the Icelandic *Eiríks saga* ("Saga of Erik"), gradually died out; but other Norse settlements in Greenland continued and maintained contact with Norway until the 15th century, when communications stopped for more than 100 years.

Erikson, Erik H., in full **ERIK HOMBURGER ERIKSON** (b. June 15, 1902, Frankfurt am Main, Ger.—d. May 12, 1994, Harwich, Mass., U.S.), German-born American psychoanalyst whose writings on social psychology, individual identity, and the interactions of psychology with history, politics, and culture influenced professional approaches to psychosocial problems and attracted much popular interest.

As a young man, Erikson attended art school and traveled around Europe. In 1927, when he was invited by the psychoanalyst Anna Freud to teach art, history, and geography at a small private school in Vienna, he entered psychoanalysis with her and underwent training to become a psychoanalyst himself. He became interested in the treatment of children and published his first paper in 1930, before completing psychoanalytic training and being elected to the Vienna Psychoanalytic Institute in 1933. The same year, he emigrated to the United States, where he practiced child psychoanalysis in Boston and joined the faculty of the Harvard Medical School. He became interested in studying the way the ego, or consciousness, operates creatively in sane, well-ordered individuals.

Erikson left Harvard in 1936 to join the Institute of Human Relations at Yale. Two years later he began his first studies of cultural influences on psychological development, working with Sioux Indian children at the Pine Ridge Reservation in South Dakota. These studies, and later work with the anthropologist Alfred Kroeber among the Yurok Indians of northern California, eventually contributed to Erikson's theory that all societies develop institutions to accommodate personality development but that the typical solutions to similar problems arrived at by different societies are different.

Erikson moved his clinical practice to San Francisco in 1939 and became professor of psychology at the University of California, Berkeley, in 1942. During the 1940s he produced the essays that were collected in *Childhood and Society* (1950), the first major exposition of his views on psychosocial development. The evocative work was edited by his wife, Joan Serson Erikson. Erikson conceived eight stages of development, each confronting the individual with its own psychosocial demands, that continued into old age. Personality development, according to Erikson, takes place through a series of crises that must be overcome and internalized by the individual in preparation for the next developmental stage.

Refusing to sign a loyalty oath required by the University of California in 1950, Erikson resigned his post and that year joined the Austen Riggs Center in Stockbridge, Mass. He then returned to Harvard as a lecturer and professor (1960–70) and professor emeritus (from 1970 until his death).

In *Young Man Luther* (1958), Erikson combined his interest in history and psychoanalytic theory to examine how Martin Luther was able to break with the existing religious establishment to create a new way of looking at the world. *Gandhi's Truth on the Origins of Militant Nonviolence* (1969) also was a psychohistory. In the 1970s Erikson examined

modern ethical and political problems, presenting his views in a collection of essays, *Life History and the Historical Moment* (1975), which links psychoanalysis to history, political science, philosophy, and theology. His later works include *The Life Cycle Completed: A Review* (1982) and *Vital Involvement in Old Age* (1986), written with his wife and Helen Q. Kivnik. A collection of papers, *A Way of Looking at Things*, edited by Stephen Schlein, appeared in 1987.

Erikson, Leif: see Leif Eriksson.

Eriocaulales, the pipewort order of monocotyledonous flowering plants (*i.e.*, those characterized by one seed leaf), consisting of one family, Eriocaulaceae, with 13 genera of small, tufted herbs with grasslike leaves that grow in aquatic and marshy habitats, mostly in tropical and subtropical regions, especially in South America.

The plants are characterized by inconspicuous flowers that are borne in small but often showy clusters, resembling superficially those of a sunflower. The flowers are either male or female, but the heads may contain flowers of only one sex or of both sexes together.

The order is considered to have a common evolutionary origin with the spiderwort order (Commelinales) from an ancestor in the lily order (Liliales). The chief genera are *Paepalanthus* (485 species), *Eriocaulon* (400 species), *Syngonanthus* (195 species), and *Leiothrix* (65 species). About 30 species of *Eriocaulon* occur outside the tropics in Japan, about 8 occur in eastern North America, and only 1 (*E. septangulare*) is known in Europe.

erionite, hydrated sodium-potassium-calcium aluminosilicate mineral in the zeolite family, one of the most abundant zeolites present in sedimentary rocks. Its chemical composition is approximately represented by the formula $(\text{Na}_2, \text{K}_2, \text{Ca})_{4-5} \text{Al}_9 \text{Si}_{27} \text{O}_{72} \cdot 27 \text{H}_2\text{O}$. It forms woolly, fibrous crystals that have an internal molecular structure similar to that of chabazite. Erionite is the principal mineral present in several tuff deposits in the U.S. states of Oregon, California, Nevada, and Arizona; a few of these have been quarried for building stone since the 19th century.

Eris, Roman DISCORDIA, in Greco-Roman mythology, the personification of strife, daughter of Nyx, and sister and companion of Ares, or the Roman Mars. Eris is best known for her part in starting the Trojan War. When she alone of the gods was not invited to the marriage of Peleus and Thetis, she threw among the guests a golden apple inscribed "For the most beautiful." Hera, Athena, and Aphrodite each claimed it, and Zeus assigned the decision to Paris. Paris awarded the apple to Aphrodite, who then helped him win Helen of Troy. In the war that resulted, Hera and Athena remained implacable enemies of Troy.

Eritrea, officially STATE OF ERITREA, Tigrinya ERTRA, country of eastern Africa, situated on the Horn of Africa. It extends for about 600 miles (1,000 km) along the Red Sea from Cape Kasar to the Bab el-Mandeb Strait and includes the Dahlak Archipelago in the Red Sea. Eritrea is bounded on the northwest by The Sudan, on the southeast by Djibouti, and on the south by Ethiopia, from which it separated in 1993. The capital is Asmera. Area 46,774 square miles (121,144 square km). Pop. (2000 est.) 4,136,000.

A brief treatment of Eritrea follows. For full treatment, see MACROPAEDIA: Eastern Africa. For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. Eritrea consists of a northward extension of the Ethiopian Plateau, bordered by

lower plains to the east and west. The plateau, 6,500 feet (2,000 m) in elevation, is dissected by the valleys of westward-flowing rivers whose eroding action has formed steep-sided, flat-topped formations known as *ambas*. To the east, the arid, treeless coastal plain (10–50 miles [16–80 km] wide) is sharply delimited by the fault line of the plateau escarpment. The northern end of the Kobar Sink (some 381 feet [116 m] below sea level and part of the Denakil Plain) extends into southeastern Eritrea. To the west of the plateau, the western lowland slopes gradually toward The Sudan. Acacia savanna and open woodlands are found there.

Eritrea

Several rivers drain the Eritrean highlands. The two largest, the Gash and the Tekeze, flow into The Sudan toward the Atbara River, a tributary of the Nile. The upper course of the Gash is known as the Mereb River. The Mereb forms the border with Ethiopia on the plateau, and the lower course of the Tekeze forms part of the border in the western lowlands.

Climatic conditions vary because of the great differences in elevation. Mitsiwa (Massawa; at sea level on the Red Sea coast) has an annual average temperature of 86° F (30° C) and an annual rainfall of 8 inches (200 mm), while Asmera, only about 40 miles (about 65 km) inland from Mitsiwa but at an elevation of 7,628 feet (2,325 m), has averages of 62° F (17° C) and 21 inches (533 mm).

The people. The varied population includes Tigrinya-speaking Christians in the southern highlands, Tigre-speaking Muslims in the northern highlands and on the eastern and western slopes, speakers of Saho and Afar in the coastal desert plain, and speakers of Beja and Nilotic languages on the western plain. Many inhabitants along the coast and the border with The Sudan speak Arabic, and many of those around Asmera also speak Italian.

Tigrinya and Tigre are the country's dominant languages, although education also is conducted in Arabic and English. Tigrinya speakers, known as the Tigray, are of the same ethnic background as the people who occupy the Ethiopian region of Tigray, just across the border to the south. The Tigray are one of two major Christian groups (the other, larger group being the Amhara, located wholly in Ethiopia) that long have dominated Ethiopian culture and politics. They are mostly farmers and make up almost half the population of Eritrea. The Tigre-speaking Muslims of the lowlands are mostly pastoralists.

The economy. Eritrea's economy is based on livestock herding and subsistence agriculture. Because of unreliable rainfall, soil erosion, and locusts, Eritrea's overall agricultural output remains poor, although irrigation has increased production. Sorghum, millet, barley, teff (a cereal grass), corn (maize), and wheat are grown (mostly on the plateau), and goats, sheep, and cattle are raised (mostly in the lowlands). Some fishing is carried out in the Red Sea. Industry, based in Asmera, is mainly concerned with food products, textiles, and leather goods; Aseb (Asseb) has a petroleum refinery. Salt is

mined in the Kobar Sink and processed at Mitsiwa and Aseb. The country also has deposits of copper, gold, potash, and iron ore. Airlines serve Mitsiwa, Asmera, and Aseb, and a road system links Eritrea with The Sudan and with Ethiopia. Mitsiwa is the country's main port, while Aseb is a major transshipment port for Ethiopia. Exports include salt, hides, cement, and gum arabic.

Government. Since its secession from Ethiopia, Eritrea has been ruled by provisional and transitional governments based on the central committees of the Eritrean People's Liberation Front. Pending promulgation of a constitution ratified in 1997, authority rests with the president, who is elected by a 90-member National Assembly.

History. As the site of the principal ports of the Aksumite empire (flourished 4th–6th century AD), Eritrea was linked to the beginnings of the Ethiopian kingdom, but it retained much of its independence until it fell under Ottoman rule in the 16th century. From the 17th to the 19th century, control of the territory was disputed among Ethiopia, the Ottomans, the kingdom of Tigray, Egypt, and Italy. The Treaty of Wichale (1889), between Italy and Menilek II of Ethiopia, recognized Italian possessions on the Red Sea, and the colony, created on Jan. 1, 1890, was named by the Italians for the Mare Erythraeum (Latin: "Red Sea") of the Romans. Eritrea was used as the main base for the Italian invasions of Ethiopia (1896 and 1935–36), and it became one of the six provinces of Italian East Africa. In 1941 the area came under British administration and remained so until Eritrea was federated as an autonomous unit to Ethiopia in 1952.

Eritrea was absorbed into the Ethiopian empire on Nov. 14, 1962. From then on, government troops battled armed Eritrean secessionist groups, including the Muslim-led Eritrean Liberation Front and the Christian-dominated Eritrean People's Liberation Front (EPLF). Fighting was particularly fierce in the years between the overthrow of Emperor Haile Selassie (1974) and the collapse of Ethiopia's military-Marxist government in 1991. With the capture of Addis Ababa by a coalition of Ethiopian rebel forces, the EPLF formed a separate provisional government for Eritrea. In April 1993 almost all of those eligible voted in favour of independence, which was declared on May 24. Isaias Afwerki, secretary-general of the EPLF, was elected the country's first president by the new National Assembly. The same legislative body ratified a new constitution in 1997, but the document was not yet promulgated before Eritrea plunged into yet another disastrous war with Ethiopia in 1998. A peace treaty ending the conflict was signed in late 2000.

Erlander, Tage (Fritiof) (b. June 13, 1901, Ransäter, Sweden—d. June 21, 1985, Huddinge, near Stockholm), politician, prime minister of Sweden for 23 years, who was the major architect of its welfare state.

Erlander graduated from the University of Lund in 1928 and was an editor for the encyclopedia *Svensk Uppslagsbok* from 1928 to 1938. He entered the Riksdag (parliament) as a Social Democrat in 1933 and held several ministerial posts in Social Democratic governments from 1938. He became prime minister and chairman of the Social Democratic Party following the death of Per Albin Hansson in 1946 and remained in both posts until October 1969. In 1970 he was elected to the new single-chamber Riksdag that his government had championed since 1955.

Over the course of Erlander's long tenure, Sweden increased its social-welfare legislation with the passage of greater old-age benefits, child allowances, and rent subsidies. His educational reforms included extending compulsory education to nine years and increasing higher-educational opportunities.

After his retirement Erlanger wrote four volumes of memoirs, *Tage Erlanger* (1972–76).

Erlangen, city, Bavaria *Land* (state), southern Germany, at the junction of the Schwabach and Regnitz rivers, just north of Nürnberg. Founded in the 8th century, it was transferred from the bishopric of Würzburg to that of Bamberg in 1017 and was sold to the king of Bohemia in 1361. Chartered in 1398, it passed to the Hohenzollern burgraves of Nürnberg in 1402 and to Bavaria in 1810. It owes the foundations of its prosperity chiefly to the French Protestant (Huguenot) refugees who settled in 1686 in "Christian Erlang," which united with Erlangen in 1824.

Erlangen is divided into an Altstadt ("Old Town") and a Neustadt ("New Town"), Christian Erlang. Notable buildings include the town hall (1731) and the former palace (1700–04) of the margraves of Kulmbach-Bayreuth, now the main building of the Friedrich-Alexander University of Erlangen-Nürnberg (founded in 1742 at Bayreuth and moved to Erlangen in 1743).

The production of gloves, hats, and drapery dates back to the Huguenots. Modern industry includes the manufacture of electromedical apparatus. The city has a port on the Main-Danube Canal. Pop. (1991 est.) 102,440.

Erlanger, Joseph (b. Jan. 5, 1874, San Francisco, Calif., U.S.—d. Dec. 5, 1965, St. Louis, Mo.), American physiologist, who received (with Herbert Gasser) the Nobel Prize for Physiology or Medicine in 1944 for discovering that fibres within the same nerve cord possess different functions.

Erlanger's research into nerve function was the product of a profitable collaboration with Gasser, one of his students at the University of Wisconsin, Madison (1906–10). Soon after Erlanger's appointment as professor of physiology at Washington University, St. Louis (1910–46), Gasser joined him there, and they began studying ways in which the recently developed field of electronics could be applied to physiological investigations.

By 1922 they were able to amplify the electrical responses of a single nerve fibre so that they could analyze them by the use of a cathode-ray oscilloscope. The characteristic wave pattern of an impulse generated in a stimulated nerve fibre, once amplified, could then be seen on the screen and the components of the nerve's response studied.

In 1932 Erlanger and Gasser found that the fibres of a nerve conduct impulses at different rates, depending on the thickness of the fibre, and that each fibre has a different threshold of excitability—*i.e.*, each requires a stimulus of different intensity to create an impulse. They also found that different fibres transmit different kinds of impulses, represented by different types of waves.

Erlanger Loan, in U.S. history, attempt of the Confederate government to raise funds abroad during the American Civil War.

In 1863 the Confederacy entered into an arrangement with the French banking house of Emile Erlanger & Company. Erlanger agreed to market \$15,000,000 worth of Confederate bonds backed by cotton. He could receive the bonds at 77 (*i.e.*, \$77 per \$100 face value) and sell them in foreign financial markets at 90. In addition, he received a 5 percent commission for selling the bonds.

The bonds were attractive to speculators because they could be exchanged for cotton after the war at a price well below the current market value. The bonds fluctuated wildly during the course of the war, however, as Confederate military fortunes waxed and waned. The bonds became worthless when the South finally collapsed, but by that time Erlanger had reaped enormous profits. He held no bonds by the time their value disintegrated, and although Erlanger had taken much of the

sale price, the South had received more than \$6,000,000 to aid in their war effort.

Erlangga, also spelled AIRLANGGA (b. 991, Bali—d. 1049?, Java), early Indonesian ruler who succeeded in reuniting the empire of eastern Java.

Erlangga was married to the daughter of Dharmavamsa, the earliest Javanese historical figure for whom clear information is available and who created an empire centred on his capital in eastern Java between about 985 and 1006, until its destruction by the Sumatran kingdom of Srivijaya. Erlangga escaped to the jungle, however, and immediately began work to reunite Dharmavamsa's possessions. By 1019 he had become the ruler of the Pasuruan area, with his capital at a hermitage at Wonogiri. Military actions between 1028 and about 1035 gave him effective control of eastern Java. During his reign, which lasted until 1049, a court poet named Mpu Kanwa composed the Javanese epic *Arjunavivaha*, a modification of the Indian *Mahabharata* that was an allegory of Erlangga's own life.

According to the Javanese chronicles, Erlangga in about 1045 prepared for the succession by dividing his kingdom between his sons. Although this action substantially weakened central control, one portion, Kadiri, remained a major sea power and controlled a substantial territory through the 12th century and into the early years of the 13th.

Erlau (Hungary): *see* Eger.

Erlon, Jean-Baptiste Drouet, Count (comte) d': *see* Drouet, Jean-Baptiste.

Ermanaric (d. between 370 and 376), king of the Ostrogoths, the ruler of a vast empire in Ukraine. Although the exact limits of his territory are obscure, it evidently stretched south of the Pripet Marshes between the Don and Dniester rivers.

The only certain facts about Ermanaric are that his great deeds caused him to be feared by neighbouring peoples and that he committed suicide because he despaired of successfully resisting the Huns, who invaded his territories in the 370s. His kingdom was thereupon destroyed and his people became subject to the Huns for about 75 years.

At an early date Ermanaric became the centre of popular tradition. According to the 6th-century historian Jordanes, the king put to death a woman named Sunilda by tying her to two wild horses and driving them apart, because her husband had treacherously deserted him. Thereupon her two brothers, Sarus and Ammius, severely wounded Ermanaric. Variations of this legend had a profound effect on medieval Germanic literature, including that of England and Scandinavia. The form of Ermanaric's name differs among authors and dialects: it occurs as Ermenrichus in Ammius Marcellinus (whose book 31 is the chief source for the king's career), as Hermanaricus in Jordanes, as Jörmunrekr in the Norse writers, and as Eormenric in the Anglo-Saxon.

Ermelo, gemeente (commune), Gelderland province, central Netherlands, near Veluwe Lake, comprising the villages of Ermelo, Nunspeet, and Elspeet. First mentioned in 855, it has ruins of the monastery of the Knights of St. John and a church with an 11th-century Romanesque steeple and a 14th-century choir. The main economic activities are poultry and dairy farming and dye, plastic, and metal industries. It is also a popular holiday centre. Pop. (1992 est.) 26,433.

ermine, any of several northern weasel (*q.v.*) species of the genus *Mustela*, family Mustelidae, called ermine especially during the winter-white colour phase; this white coat is the ermine of the fur trade.

The species that furnished the ermine for royal robes in Europe was the stoat (*M. erminea*), also called short-tailed weasel, or Bona-

parte weasel. The ermine, or stoat, is found in northern North America, in Eurasia, and in North Africa. Ermines are most abundant in thickets, woodland, and semitimbered areas. These slender, agile, voracious mammals measure 13 to 29 cm (5 to 12 inches) in head and body length; have a tail length of 5 to 12 cm; and weigh less than 0.3 kg (0.66 pound). Females are smaller than males, and northern races smaller than southern.

Ermine (*Mustela erminea*)

© Charlie Ott—The National Audubon Society Collection/Photo Researchers

In summer the ermine is brown, with whitish throat, chest, and belly. In colder climates the winter coat is white, except for the black tail tip. In moderately cold climates the fur becomes only partly white.

Ermines feed on small mammals, birds, eggs, frogs, and occasional invertebrates. Small prey is seized at the base of the skull, larger prey by the throat. The litter contains 3 to 13 young, born after a gestation prolonged as much as 10 months because of delayed implantation in the wall of the uterus.

The winter-taken pelts, prized for fineness and pure colour, are among the most valuable of commercial furs and are obtained mainly in northern Eurasia. During the reign of Edward III (1327–77) of England, the wearing of ermine was restricted to members of the royal family. Thereafter, state robes were constructed in such a way that in many cases the rank and position of the wearer could be determined by the presence or absence and the disposition of the black spots.

Ermine Street, major Roman road in England between London and York. It ran north from Bishopsgate, London, through Ware, Royston, Godmanchester, and Ancaster to Lincoln (Lindum) and thence to York (Eboracum), crossing the River Humber at Brough. It remained one of the great roads of England until modern times. The Saxon name Ermine Street is also applied to the Roman road from Silchester (Calleva Atrebatum) to Cirencester (Corinium) and Gloucester (Glevum), crossing the River Thames just below Cricklade and descending the Cotswold escarpment at Birdlip.

Ermoúpolis (Greece): *see* Hermoúpolis.

Erne, Lough, Irish LOCH ÉIRNE, lake in Fermanagh district (established 1973), formerly County Fermanagh, Northern Ireland. It is 40 miles (64 km) long and has an average width of 5 miles (8 km) and a maximum depth of 200 feet (60 m). The lake consists of the shallow Upper Lough Erne, 12 miles (19 km) long, and Lower Lough Erne, 18 miles (29 km) long, linked by a 10-mile (16-kilometre) strait that is part of the River Erne. The lakes lie in an almost level carboniferous limestone plateau. Although formed by the solution of limestone, their basins are blanketed with heavy boulder clays. The level in the upper lake is subject to fluctuations because of the constricted flow produced by these glacial features. Numerous islands dot the lakes and provide recreation facilities.

A flood-relief project, completed in 1959, was designed to control the water supply to

hydroelectric power stations at Ballyshannon and Cliff. As a result, about 29,000 acres (11,700 hectares) of land around the upper lake were freed from summer flooding and excessive waterlogging.

Ernest, German ERNST, name of rulers grouped below by country and indicated by the symbol •.

SAXE-COBURG-GOTHA

• **Ernest I** (b. Jan. 2, 1784, Coburg, Saxe-Coburg-Saalfeld [Germany]—d. Jan. 29, 1844, Gotha, Saxe-Coburg-Gotha), duke of Saxe-Gotha-Saalfeld (as Ernest III) from 1806 and then, from 1826, duke of Saxe-Coburg-Gotha. He was the uncle of Queen Victoria and the father of her husband, Prince Albert.

When Ernest succeeded to the Duchy of Saxe-Coburg-Saalfeld on the death of his father (Francis) in 1806, the duchy was occupied by Napoleon, and Ernest did not recover it until the peace of Tilsit (July 1807). He commanded the Saxon V army corps in 1813–14 and reduced Mainz by blockade; he also took part in the campaign of 1815. At the Congress of Vienna he received the principality of Lichtenberg, which he sold to Prussia in 1834.

In 1826, after the death of his brother-in-law Frederick, the last duke of Saxe-Gotha (1825), Ernest gave up Saalfeld and received Gotha, becoming Ernest I of Saxe-Coburg-Gotha. In 1821 he had given a constitution to Coburg, but he did not change the traditional system of estates in Gotha. He married twice: (1) in 1817, Louise of Saxe-Gotha, whom he divorced in 1826; (2) in 1832, Mary of Württemberg. Of his sons, Ernest (b. 1818) succeeded him, and Albert (b. 1819) married Queen Victoria of Great Britain. His brother Leopold (1790–1865) became king of the Belgians and his sister Victoria (1786–1861) was Queen Victoria's mother.

• **Ernest II** (b. June 21, 1818, Coburg, Saxe-Coburg-Saalfeld [Germany]—d. Aug. 22, 1893, Reinhardsbrunn, Thuringia), duke of Saxe-Coburg-Gotha, brother of Prince Albert (consort of Queen Victoria of England), and a strong supporter of German unification.

Ernest II, detail from a lithograph by C. Baugnet after a portrait by H. Thorburn, 1844

By courtesy of the Kunstsammlungen Veste Coburg, Germany

He succeeded his father, Duke Ernest I, in 1844. In 1852 he gave Gotha a new constitution, which in part coordinated the administration of his two duchies. In 1861 Ernest concluded a military agreement with Prussia. About this time he became patron of the Nationalverein (German: "National Union") and allowed his court to become the centre of nationalist agitation. During the Seven Weeks' War of 1866, after vainly trying to mediate between Prussia and Austria, he put his troops under Prussian direction. His role in politics outside his own duchies ended when the

German empire was formed. Because Ernest had no children, his title was inherited by his nephew Alfred, Duke of Edinburgh.

SAXE-GOTHA-ALTENBURG

• **Ernest I**, byname ERNEST THE PIOUS, German ERNST DER FROMME (b. Dec. 25, 1601, Altenburg, Saxony [Germany]—d. March 26, 1675, Gotha, Saxe-Gotha), duke of Saxe-Gotha-Altenburg, who, after the ravages of the Thirty Years' War, sought to rebuild and reform his country.

An ardent Lutheran, Ernest allied himself with the Swedes from 1631, fighting in the battles of Lech, Nürnberg, Lützen, and Nördlingen. In 1635 he signed the Peace of Prague and turned to the governing of his duchy, making it eventually one of the most prosperous areas of Germany.

Ernest's educational reforms—made with the help of Veit Ludwig von Seckendorf and Andreas Reyher (a disciple of John Amos Comenius)—were so fundamental that he might be called the real founder of the modern common school system in Germany. A set of school regulations entitled *Schulmethodus* ("School Method"; 1642; revised 1648, 1658, 1662, 1672), compiled under his direction, instituted such ideas as compulsory education, grading, and an enlarged curriculum to embrace sciences, civics, and other "useful" subjects. He also established the ducal library of Gotha and generally, through his patronage, set the stage for the German Enlightenment.

Ernest Augustus, German ERNST AUGUST, name of electors and kings of Hanover, grouped below chronologically and indicated by the symbol •.

• **Ernest Augustus** (b. Nov. 20, 1629, Herzberg am Harz Castle, Hanover [Germany]—d. Jan. 23, 1698, Herrenhausen Castle), duke (from 1679) and elector (from 1692) of Hanover, father of George Louis, who became George I, king of Great Britain.

The Protestant bishop of Osnabrück from 1661, Ernest Augustus succeeded his elder brother as ruler of the duchy of Lüneburg-Calenburg (which became known as the duchy of Brunswick-Lüneburg or, more popularly, because of its capital city, the duchy of Hanover). In 1692, in return for lavish promises of assistance to the Holy Roman Empire and the Habsburgs, the emperor Leopold I granted him the rank and title of elector of Brunswick-Lüneburg (*i.e.*, Hanover), which became the ninth electorate of the empire. Indignant protests followed this proceeding. A league was formed to prevent any addition to the electoral college; France and Sweden were called upon for assistance. This agitation, however, soon died away, and his son was confirmed as elector by the imperial diet.

Ernest Augustus took a step of great importance in the history of Hanover and Great Britain when, in 1658, he married Sophia, daughter of the elector palatine Frederick V and granddaughter of James I of Great Britain; for their son became, by the terms of the Act of Settlement of 1701, king of Great Britain and Ireland in 1714.

• **Ernest Augustus**, also called (1799–1837) PRINCE ERNEST AUGUSTUS, DUKE OF CUMBERLAND, DUKE OF TEVIOTDALE, EARL OF ARMAGH (b. June 5, 1771, Kew, Surrey, Eng.—d. Nov. 18, 1851, Herrenhausen, Hanover [Germany]), king of Hanover, from 1837 to 1851, the fifth son of George III of England.

Ernest Augustus studied at Göttingen, entered the Hanoverian army, and served as a leader of cavalry when war broke out between Great Britain and France in 1793. When Hanover withdrew from the war in 1795 he returned to England, being made lieutenant general in the British army in 1799. In the same year he was created duke of Cumberland.

In 1810 Ernest Augustus was severely injured by an assailant, probably his valet Sellis, who was found dead; subsequently two men were imprisoned for asserting that the duke had murdered his valet. Recovering from his wounds, the duke again proceeded to the seat of war; as a British field marshal, he was in command of the Hanoverian army during the campaigns of 1813 and 1814. Back in England in 1815, however, the duke's strong Toryism made him unpopular. He resented the refusal of Parliament to increase his allowance and retired for some years to Berlin. On the accession of George IV he returned to England but he ceased to play an important part in politics after the accession of William IV in 1830.

When William died in June 1837, the crowns of Great Britain and Hanover were separated; and Ernest Augustus, as the nearest male heir of the late king, became king of Hanover. He cancelled the constitution that William had given in 1833, and the constitution that he sanctioned in 1840 was characteristic of his own illiberal ideas. His reign was a stormy one, and serious trouble between king and people had arisen when he died. He was succeeded by his son, George V.

• **Ernest Augustus**, also called DUKE OF CUMBERLAND, HERZOG VON BRAUNSCHWEIG-LÜNEBURG (b. Sept. 21, 1845, Hannover, Hanover [Germany]—d. Nov. 14, 1923, Gmunden, Austria), only son of George V of Hanover and pretender to the Hanoverian throne from 1878 to 1913.

After his father was deposed as a result of the events of the Seven Weeks' War between Prussia and Austria (in which Hanover had sided with losing Austria), Ernest Augustus lived mainly in Austria; on his father's death (1878), however, he maintained his claim to the Hanoverian throne. In 1884 on the death, without issue, of his kinsman William, the last sovereign duke of Brunswick, he also claimed that duchy. Inspired by Chancellor Otto von Bismarck, the German Federal Council rebuffed him naming Prince Albert of Prussia as regent of Brunswick. After the latter's death the duke was again excluded (1907), and the regency continued.

In 1902 Ernest Augustus had told the German emperor William II that he was prepared to accept the imperial regime in Germany; and in May 1913 the Welf-Hohenzollern feud over possession of the duchy of Brunswick was healed by the marriage of his son Ernest Augustus (1887–1953) to William II's only daughter, Victoria Louise. Ernest Augustus then renounced his rights in favour of his son, the Federal Council lifted its veto, and the young prince became a sovereign ruler as Ernest Augustus, duke of Brunswick (Nov. 1, 1913). He abdicated with other German princes, on Nov. 8, 1918. A Titles Deprivation Act in 1917, followed by an order in council in 1919, deprived father and son of all their titles and honours in the United Kingdom.

Ernest Louis, German in full ERNST LUDWIG KARL ALBRECHT WILHELM (b. Nov. 25, 1868, Darmstadt, Hesse-Darmstadt [Germany]—d. Oct. 9, 1937, near Darmstadt), grand duke of Hesse-Darmstadt from 1892 until his abdication in 1918, at the end of World War I. His father was the grand duke Louis IV, whom he succeeded on March 13, 1892; his mother was Princess Alice, daughter of Queen Victoria of England and the prince consort, Albert.

Ernest Louis was best known as a patron of the arts. In 1899 he founded the Darmstadt Artists' Colony for architects, designers, sculptors, and craftsmen. Most of the colony's buildings were designed by the Viennese architect Joseph Maria Olbrich. Much of the work done under the patronage of Ernest Louis was a reaction against the Jugendstil movement, the German version of Art Nouveau. The Grand Duke himself wrote poems, plays, essays, and piano music.

Ernestine duchies: see Saxon duchies.

Ernst (Danish, German, etc., personal name): see under Ernest, except as below.

Ernst, Max (b. April 2, 1891, Brühl, Ger.—d. April 1, 1976, Paris, Fr.), German painter, sculptor, one of the leading advocates of irrationality in art, and an originator of the Au-

Max Ernst, photograph by Yousuf Karsh, 1965
© Karsh from Rapho/Photo Researchers

tomatism movement of Surrealism. His youthful interests were psychiatry and philosophy, but he abandoned his studies at the University of Bonn for painting.

After serving in the German army during World War I, Ernst was converted to Dada (*q.v.*), a nihilistic art movement, and formed a group of Dada artists in Cologne; with the artist-poet Jean Arp, he edited journals and created a scandal by staging a Dada exhibit in a public rest room. More important, however, were his Dada collages and photomontages, such as "Here Everything Is Still Floating" (1920), a startlingly illogical composition made from cutout photographs of insects, fish, and anatomical drawings ingeniously arranged to suggest the multiple identity of the things depicted.

In 1922 Ernst moved to Paris, where, two years later, he became a founding member of the Surrealists, a group of artists and writers whose work grew out of fantasies evoked from the unconscious. To stimulate the flow of imagery from his unconscious mind, Ernst began in 1925 to use the techniques of frottage (pencil rubbings of such things as wood grain, fabric, or leaves) and decalomania (the technique of transferring paint from one surface to another by pressing the two surfaces together). Contemplating the accidental patterns and textures resulting from these techniques, he allowed free association to suggest images he subsequently used in a series of drawings ("Histoire naturelle," 1926) and in many paintings such as "The Great Forest" (1927) and "The Temptation of St. Anthony" (1945). These vast, swamplike landscapes stem ultimately from the tradition of nature mysticism of the German Romantics.

After 1934 Ernst's activities centred increasingly on sculpture, using improvised techniques in this medium just as he had in painting. "Oedipus II" (1934), for example, was cast from a stack of precariously balanced wooden pails to form a belligerent-looking phallic image.

At the outbreak of World War II, Ernst moved to the United States, where he joined his third wife, the collector and gallery owner Peggy Guggenheim, and his son, the American painter Jimmy Ernst. While living on Long Island, N.Y., and after 1946 in Sedona, Ariz. (with his fourth wife, the American painter Dorothea Tanning), he concentrated on such sculptures as "The King Playing with the Queen" (1944), which shows African influence. After his return to France in 1949, his

work became less experimental: he spent much time perfecting his modeling technique in traditional sculptural materials.

Ernst, Paul, in full PAUL KARL FRIEDRICH ERNST (b. March 7, 1866, Elbingerode, Saxony [Germany]—d. May 13, 1933, Sankt Georgen, Austria), German writer known particularly for his short stories and for hundreds of essays on philosophical, economic, and literary problems.

Ernst studied for the ministry but quickly became disillusioned with theology. He became a militant Marxist and the editor of the *Berliner Volkstribüne*. He severed his Marxist connections at the turn of the century, however, and repudiated the doctrine in *Der Zusammenbruch des Marxismus* (1919; "The Collapse of Marxism"). He had already expressed his antagonism toward naturalism in art and called for a return to classicism in his essay *Der Weg zur Form* (1906; "The Road to Form"). His search for eternal truths led him through German idealist philosophy back to a form of Christianity that he dramatized in what he called redemption drama, best exemplified by *Ariadne auf Naxos* (1912).

Although Ernst believed his greatest literary contribution was in the theatre, he became popular through his novels and won critical acclaim only in his short stories. The autobiographical novel *Der schmale Weg zum Glück* (1904; "The Narrow Road to Happiness") passed through more than 10 editions and *Jugend-erinnerungen* (1930; "Recollections of Youth") and *Grün ans Trümmern* (1933;

Paul Ernst
Bavaria-Verlag

"Green Out of Ruins"), of folkloric inspiration, were almost as popular. His most famous collection of short stories is *Komödianten- und Spitzbubengeschichten* (1920; "Tales of Comedians and Rogues"). *Erdachte Gespräche* (1921; "Imagined Conversations") is his best-known essay collection.

Ernst, Richard R., in full RICHARD ROBERT ERNST (b. Aug. 14, 1933, Winterthur, Switz.), Swiss researcher and teacher who in 1991 won the Nobel Prize for Chemistry for his contribution to the applications of nuclear magnetic resonance (NMR) spectroscopy. Ernst's refinements made NMR techniques a basic and indispensable tool in chemistry and also extended their usefulness to other sciences.

Ernst received both his B.A. in chemistry (1957) and his Ph.D. in physical chemistry (1962) from the Eidgenössische Technische Hochschule in Zürich. From 1963 to 1968 he worked as a research chemist in Palo Alto, Calif. In 1966, working with an American colleague, Ernst discovered that the sensitivity of NMR techniques (hitherto limited to analysis of only a few nuclei) could be dramatically increased by replacing the slow, sweeping radio waves traditionally used in NMR spectroscopy with short, intense pulses. His discovery enabled analysis of a great many more types of nuclei and smaller amounts of materials.

In 1968 he returned to Switzerland to teach at his alma mater. He was made assistant professor in 1970 and full professor in 1976. His second major contribution to the field of NMR spectroscopy was a technique that enabled a high-resolution, "two-dimensional" study of very large molecules. With Ernst's refinements, scientists were able to determine the three-dimensional structure of organic and inorganic compounds and of biological macromolecules such as proteins; to study the interaction between biological molecules and other substances such as metal ions, water, and drugs; to identify chemical species; and to study the rates of chemical reactions.

Ernst also was credited with many inventions and held several patents in his field.

Ernst August (German personal name): see under Ernest Augustus.

Ernst Ludwig (German personal name): see under Ernest Louis.

Erode, town, northern Tamil Nādu state, southeastern India, on the Cauvery River. Temple inscriptions indicate the prominent role played by the town as early as the 10th century AD. Its name is associated with a Cōla temple (907–1279) and means "wet skull." Though Erode was successively destroyed by Marāthā, Mysore Muslim, and British armies, the surrounding fertile soils assisted in the town's quick recovery as an agricultural trade centre.

Erode is a railway hub and is the junction for the Pykāra and Mettūr hydroelectric schemes. Industries include cotton ginning and the manufacture of transport equipment. It has industrial schools and several colleges affiliated with the University of Madras. Pop. (1991) 159,232.

Eromanga (Vanuatu): see Erromango.

Eros, in Greek religion, god of love. In the *Theogony* of Hesiod (fl. 700 BC), Eros was a primeval god, son of Chaos, the original primeval emptiness of the universe; but later tradition made him the son of Aphrodite, goddess of sexual love and beauty, by either Zeus (the king of the gods), Ares (god of war and of battle), or Hermes (divine messenger of the gods). Eros was god not simply of passion but also of fertility. His brother was Anteros, the god of mutual love, who was sometimes described as his opponent. The chief associates of Eros were Pothos and Himeros (Longing and Desire). Later writers assumed the existence of a number of Erores (like the several versions of the Roman Amor). In Alexandrian poetry he degenerated into a mischievous child. In archaic art he was represented as a beautiful winged youth but tended to be made younger and younger until, by the Hellenistic period, he was an infant. His chief cult centre was at Thespie in Boeotia, where the Erotidia were celebrated. He also shared a sanctuary with Aphrodite on the north wall of the Acropolis at Athens. See also Cupid.

Eros, first asteroid found to travel mainly inside the orbit of Mars and the first to be orbited and landed on by a spacecraft. It was discovered in 1898 by the German astronomer Gustav Witt. Eros is an elongated body about 33 km (20.5 miles) at its widest. It can approach to within 22 million km (14 million miles) of Earth. In February 2000 the Near Earth Asteroid Rendezvous (NEAR Shoemaker) spacecraft went into orbit around Eros, collecting a full year of data on its surface composition and physical properties before touching down gently on Eros's surface. A significant finding of the mission was the discovery that Eros is an undifferentiated asteroid—i.e., it was never subjected to extensive melting and segregation into layers of distinct

composition—and so may be a pristine sample of primordial solar system material.

erosion, removal of surface material from the Earth's crust, primarily soil and rock debris, and the transportation of the eroded materials by natural agencies from the point of removal.

A brief treatment of erosion follows. For full treatment, see *MACROPAEDIA: Geomorphic Processes*.

The broadest application of the term erosion embraces the general wearing down and molding of all landforms on the Earth's surface, including the weathering of rock in its original position, the transport of weathered material, and erosion caused by wind action, fluvial processes, marine processes, and glacial processes. This broad definition is more correctly called denudation, or degradation, and includes mass-movement processes. A narrow and somewhat limiting definition of erosion excludes the transport of eroded material by natural agencies, but the exclusion of the transport phenomenon makes the distinction between erosion and weathering very vague. Erosion, therefore, includes the transportation of eroded or weathered material from the point of degradation, but not the deposition of material at a new site.

Erosion will often occur after rock has been disintegrated or altered through weathering. Weathered rock material will be removed from its original site and transported away by a natural agent. With both processes often operating simultaneously, the best way to distinguish erosion from weathering is by observing the transportation of material.

Moving water is the most important natural erosional agent. The wastage of the sea coast, or coastal erosion, is brought about in the main by the action of sea waves but also, in part, by the disintegration or degradation of sea cliffs by atmospheric agents such as rain, frost, and tidal scour. Sea-wave erosion is accomplished primarily by hydraulic pressure, the impact of waves striking the shore, and by the abrasion of sand and pebbles agitated incessantly by the water. Wave impact and hydraulic action is usually most devastating to human-made coastal features such as a breakwater or mole. The impact and hydraulic action of storm waves are the most significant upon shores composed of highly jointed or bedded rock, which are vulnerable to quarrying, the hydraulic plucking of blocks of rock. The abrasive action of sand and pebbles washed against shorelines is probably the most significant wave erosional activity. Particles are dragged back and forth by wave action, abrading the bedrock along the coast and

abrading each other, gradually wearing pebbles into sand. Wave erosion creates retrograde, or retreating, shorelines with sea cliffs, wave-cut benches at the base of the sea cliffs, and sea arches—arcuate or rectangularly shaped archways that result from different rates of erosion due to varied bedrock resistance. Besides the back-and-forth transportation of materials by wave action, sediments are transported by the lateral movement of waves after they wash ashore (beach drifting) or by shallow-water transport just offshore, known as longshore currents. These transportational movements lead to deposition and the formation of prograde, or advancing, shorelines, bars, spits, bayhead beaches, and barrier beaches.

In rivers and estuaries the erosion of banks is caused by the scouring action of the moving water, particularly in times of flood and, in the case of estuaries, also by the tidal flow on the ebb tide when river and tidewater combine in their erosive action. This scouring action of the moving water entrains and transports sediments within the river or stream load. These entrained sediments become instruments of erosion as they abrade one another in suspended transport or as they abrade other rock and soil as they are dragged along the river bottom, progressively entraining additional sediments as long as the river's volume and velocity of the stream continues to increase. As the velocity of the river decreases, the suspended sediments will be deposited, creating landforms such as broad alluvial fans, floodplains, sandbars, and river deltas. The land surface unaffected by rivers and streams is subjected to a continuous process of erosion by the action of rain, snowmelt, and frost, the resulting detritus and sediment being carried into the rivers and thence to the ocean.

Glacial erosion occurs in two principal ways: through the abrasion of surface materials as the ice grinds over the ground (much of the abrasive action being attributable to the debris embedded in the ice along its base); and by the quarrying or plucking of rock from the glacier bed. The eroded material is transported until it is deposited or until the glacier melts.

In some arid and desert tracts, wind has an important effect in bringing about the erosion of rocks by driving sand, and the surface of sand dunes not held together and protected by vegetation is subject to erosion and change by the drifting of blown sand. This eolian action erodes material by deflation, the removal of small loose particles, and by sandblasting of landforms by wind-transported material. Continued deflation of loose particles from landforms leaves behind larger particles, more resistant to deflation. Wind action transports eroded material above or along the surface of the Earth either turbulently, particles moving in all directions, or by laminar flow, in which adjacent sheets of air slip past one another. The transportation of wind-eroded material continues until the velocity of the wind can no longer sustain the size particle being transported or until the wind-blown particles collide with or cling to a surface feature.

Erramala Range, range of hills in western Andhra Pradesh state, southern India. The hills are situated on the Deccan Plateau and are composed of quartzites and slates of the Cambrian Period (540 million to 505 million years ago) with interbedded lavas of a younger age. The range trends northeast to southwest, and tributaries of the Kunderu River have divided it into longitudinal hills and valleys.

Erroll, Francis Hay, 9th earl of, LORD HAY OF ERROL, Erroll also spelled *ERROL* (baptized April 30, 1564—d. July 16, 1631, Slains, Aberdeen, Scot.), Scottish nobleman, a leader of the militant Roman Catholic party in Scotland.

Erroll was converted to Roman Catholicism at an early age and succeeded to the earldom

in 1585. Between 1588 and 1597 he and his associates were involved in a series of treasonable activities the object of which was the restoration of Roman Catholicism in Scotland, and ultimately in England, by the aid of Spanish money and arms. Twice, in 1589 and 1594, they engaged in armed rebellion, but both rebellions dispersed when King James VI took the field in person. From 1595 to 1596 Erroll was in exile in Holland. On several occasions Erroll and his friends were forced to make a nominal submission to the Reformed Kirk; but in spite of their uniform lack of success and the alarmed hostility of the English government, James VI's determination to preserve a Roman Catholic party as a counterpoise to the ministers of the kirk, and his fear of endangering the English succession by alienating Roman Catholic opinion, prevented any violent retribution overtaking the earls. After 1597 Erroll played little part in public affairs. His religious convictions remained unchanged, and from 1608 to 1611 he was imprisoned as an "obstinate papist."

Erromango, also spelled *EROMANGA*, volcanic island of Vanuatu, in the southwestern Pacific Ocean. The island, with an area of 376 square miles (975 square km), rises in the interior to about 2,900 feet (885 m) at Santop Peak. It had a sandalwood trade beginning in 1825. There are significant stands of timber on Erromango, primarily kauri pine and assorted hardwoods, but commercial development has been retarded by the lack of shipping facilities. The island has no adequate harbours, and the only good anchorage is Cook Bay on the east coast. There are two airstrips. Copra is produced.

error, in applied mathematics, the difference between a true value and an estimate, or approximation, of that value. In statistics, a common example is the difference between a population mean and the mean of a sample drawn from that population. In numerical analysis, round-off error is exemplified by the difference between the true value of the irrational number π and the value of rational expressions such as $22/7$, $355/113$, 3.14 , or 3.14159 . Truncation error results from ignoring all but a finite number of terms of an infinite series. For example, the exponential function e^x may be expressed as the sum of the infinite series

$$1 + x + x^2/2 + x^3/6 + \dots + x^n/n! + \dots;$$

stopping the calculation after any finite value of n gives an approximation to the value of e^x that will be in error, though this error can be made as small as desired by making n large enough.

The relative error is the numerical difference divided by the true value; the percentage error is this ratio expressed as a percent. The term random error is sometimes used to distinguish the effects of inherent imprecision from so-called systematic error, which may originate in faulty assumptions or procedures.

Ersari carpet, any of a colourful variety of floor coverings handmade by Ersari Turkmens of Turkmenistan and Uzbekistan. Contrary to the custom of the other Turkmens, the Ersaris have no proper gul, or specific tribal motif; consequently, their carpets may have lattices of stepped diamonds, grids of rectangular panels rather like a Garden carpet, diagonal rows of small motifs, much-distorted arrangements of Chinese cloud bands, rows of stylized palm trees, or degenerate imitations of Persian *herāti* and *mina khani* patterns. Ersari carpets make more use of yellow than do rugs made by other tribes, and often, in backgrounds, two shades of blue blend or are merged with dark brown in a characteristic fashion. Prayer rugs differ from those of the other Turkmens in having frank prayer-niche designs, the arch (to indicate the direction of Mecca, the holy city) constricted at the head.

Stepped diamond motif, detail of an Ersari carpet from Russian Turkistan, 19th century; in the Textile Museum, Washington, D.C.

Textile Museum Collection, Washington, D.C. photograph, Otto E Nelson

These Ersari prayer rugs are among the most attractive Turkmen products. Ersari carpets are more loosely woven than those of the other Turkmen, with softer wool in coarser knotting.

Erse language: see Irish language; Scottish Gaelic language.

Erskine, John (b. 1509, Dun, near Montrose, Scot.—d. March 12 or June 17, 1591), Scottish lord of Dun and Calvinist Reformer.

Erskine came of a wealthy and powerful family. His grandfather, father, and two other near relatives were killed at the Battle of Flodden in 1513. He studied at King's College, Aberdeen, and traveled for a number of years in Europe. Although a layman, he played a prominent part in the ecclesiastical history of Scotland. He was a friend of John Knox, George Wishart, and other Scottish Reformers but was less extreme in his views than some. He was one of the principals in the negotiations between the Reformers and Mary Stuart, the Roman Catholic queen of Scotland (reigned 1542–67). His wealth and influence made him important to both sides. In 1560 the Reformed church appointed him superintendent for the districts of Angus and Mearns. He was moderator of several church assemblies and helped formulate the Church of Scotland's Presbyterian doctrine and government in the *Second Book of Discipline* (1578). In 1579 he was named to the king's council.

Erskine, John: see Mar, John Erskine, 1st (and 18th) Earl of; Mar, John Erskine, 2nd (and 19th) Earl of; Mar, John Erskine, 6th Earl of.

Erskine (of Restormel), Thomas Erskine, 1st Baron (b. Jan. 10, 1750, Edinburgh, Scot.—d. Nov. 17, 1823, Almondell, Linlithgowshire), British Whig lawyer who made important contributions to the protection of personal liberties. His defense of various politicians and reformers on charges of treason and related offenses acted to check repressive measures taken by the British government in the

aftermath of the French Revolution. He also contributed to the law of criminal responsibility. He was raised to the peerage in 1806.

Early life and career. Erskine was the youngest son of Henry David Erskine, 10th Earl of Buchan. Though he wanted to enter a learned profession because of the straitened financial circumstances of his family, he sought a career in the Royal Navy instead. He became a midshipman in 1764 but left the service in 1768 and purchased a commission in a regiment of the 1st Royals. His unsigned pamphlet, "Observations on the Prevailing Abuses in the British Army" (1772), gained a wide audience. Finding opportunities for advancement in the British army no more favourable than in the navy and encouraged by the friendly interest of Lord Mansfield, Erskine decided to enter the law. He was admitted to Lincoln's Inn in 1775, and in 1778 he received an honorary M.A. degree from Trinity College, Cambridge, after which he was called to the bar.

Professional life. Within a few months, his future was assured by his defense of Captain Thomas Baillie, lieutenant governor of Greenwich Hospital, who had published charges of corruption in the administration of the hospital. Those accused instituted a proceeding to show cause why Baillie should not be prosecuted for criminal libel. Erskine was retained by Baillie as his junior counsel and in his first appearance at the bar vindicated his client with remarkable eloquence and courage. He very quickly rose to the leading position in the English bar. In the following year, he successfully assisted the defense in the court-martial of Admiral Augustus Keppel. His successful defense of Lord George Gordon on the charge of high treason for instigating the anti-Catholic riots of 1780 substantially destroyed the English legal doctrine of constructive treason—i.e., treason imputed to a person from his conduct or course of actions, though none

Thomas Erskine, detail of an oil painting by Sir William Charles Ross; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

of his separate actions amounts to treason. Erskine appeared in most of the major cases that arose out of the disruption of commercial relations with France, which had entered the U.S. War of Independence against Britain in 1778.

In 1784 he unsuccessfully represented a clergyman defending a charge of criminal libel, but his contention that it is for the jury, not the judge, to determine whether a publication is libelous was vindicated by the passage of the Libel Act of 1792. In 1789 he won an acquittal for a bookseller who was charged with criminal libel for selling a pamphlet criticizing the trial of Warren Hastings, a former governor-general of India who was impeached for alleged misconduct. Erskine's speech on that occasion is one of the monuments in the literature of English freedom. His unsuccessful defense of Thomas Paine, whom William Pitt, the prime minister, had caused to be indicted for treason for publishing *The Rights of Man*,

cost him his position as attorney general to the Prince of Wales.

His defense of various politicians and reformers on charges of treason and related offenses placed a powerful check on the repressive measures taken by the ministry of William Pitt in response to the insecurity and hysteria engendered in England by the French Revolution and its aftermath. In 1800, by establishing the defendant's insanity, he successfully defended James Hadfield, who had attempted to assassinate George III. Erskine's argument at the trial is an important contribution to the law of criminal responsibility.

Erskine, who was an intimate of the Whig leaders Charles James Fox and Richard Brinsley Sheridan, sat in the House of Commons from 1783 to 1784 and from 1790 until he became a peer in 1806. His undistinguished parliamentary career was almost wholly devoid of the forensic triumphs that marked his legal practice. In 1806–07 he was lord chancellor during the so-called Ministry of All the Talents. His latter years were marked by private sorrows and misfortunes, which caused him almost completely to withdraw from public affairs. Toward the close of his life, however, he again achieved widespread prominence by his role in defense of Queen Caroline, whom her husband, George IV, had brought to trial before the House of Lords for adultery in order to deprive her of her rights and title.

Erskine excelled principally as a jury lawyer. His courtroom speeches are characterized by vigour, cogency, and lucidity and often by great literary merit.

(F.A.A./Ed.)

BIBLIOGRAPHY. Lloyd Paul Stryker, *For the Defense: Thomas Erskine, the Most Enlightened Liberal of His Times, 1750–1823* (1947), is a modern biography by a well-known American courtroom advocate. John Campbell, *Lives of the Lord Chancellors and Keepers of the Great Seal of England*, 5th ed., vol. 6 (1868, reissued 1973), presents an interesting and anecdotal account of Erskine's life, although it is marred by some inaccuracies.

Erté, dynamic of ROMAIN DE TIRTOFF (b. Nov. 23, 1892, St. Petersburg, Russia—d. April 21, 1990, Paris, France), fashion illustrator of

Afternoon dress of black and white satin designed by Erté for *Harper's Bazaar*, 1924

© Sevenarts Limited

the 1920s and creator of visual spectacle for French music-hall revues. His designs included dresses and accessories for women; costumes and sets for opera, ballet, and dramatic productions; and posters and prints. (His byname

was derived from the French pronunciation of his initials, R.T.)

Erté was brought up in St. Petersburg. In 1912 he went to Paris, where he briefly collaborated with Parisian couturier Paul Poiret. He then became a costume designer and began selling his pen-and-ink and gouache fashion illustrations to American fashion houses. From 1916 to 1937 he was under contract to the American fashion magazine *Harper's Bazaar*. (A collection of *Harper's Bazaar* illustrations was published in *Designs by Erté* [1976] with text by Stella Blum.) His highly stylized illustrations depicted models in mannered poses draped in luxurious jewels, feathers, and soft, flowing materials against a background of interiors in the Art Deco style.

The same lavish style marked Erté's theatrical designs. For 35 years he designed elaborately structured opening tableaux, finale scenes, and costumes for the French theatre. He worked for the Folies-Bergère in Paris from 1919 to 1930. During the 1920s he costumed the performers appearing in such American musical revues as the *Ziegfeld Follies* and *George White's Scandals*. In the 1960s Erté produced lithographs, serigraphs, and sheet-metal sculptures. His autobiography, *Things I Remember*, was published in 1975.

BIBLIOGRAPHY. Charles Spencer, *Erté*, 2nd ed. (1981).

Ertebølle industry, tool industry of the coastal regions of northern Europe, dating from about 9000 to 3500 BC. The Ertebølle industry, named after Ertebølle, Den., where it was first recognized, is classed as a Mesolithic (Middle Stone Age) industry because its people used chipped, rather than polished, stone tools and because they were hunters and fishers rather than agriculturists, who used polished stone tools in the developing agriculture of the Neolithic Period (New Stone Age). The Ertebølle industry had in many ways, however, borrowed from Neolithic industries of central Europe, which were partly contemporaneous with it. The Ertebølle culture, known from its kitchen middens, or garbage heaps, had pottery, chisel-shaped arrowheads, flat and radial flaking techniques for working flint, and, toward the end of the period, some agriculture and stock raising—all Neolithic skills.

Ervin, Samuel J., Jr., in full SAMUEL JAMES ERVIN, JR. (b. Sept. 27, 1896, Morganton, N.C., U.S.—d. April 23, 1985, Winston-Salem, N.C.), U.S. senator best known as chairman of the Select Committee on Presidential Campaign Activities, which investigated the Watergate Scandal during the administration of Richard M. Nixon.

The son of a lawyer, Ervin graduated from the University of North Carolina in 1917 and earned a law degree from Harvard University in 1922. He returned to North Carolina to practice law and later held several state judicial posts, including justice of the North Carolina Supreme Court. In 1954 Ervin won election to the U.S. Senate and quickly established a reputation as an expert on—and defender of—the Constitution. He sat on the Senate committee that censured Senator Joseph McCarthy, and he helped investigate labour racketeering in the late 1950s. During the 1960s he led Southern filibusters against civil-rights laws, while simultaneously acting as one of the leading champions of civil liberties.

Ervin supported President Nixon on the war in Vietnam but disagreed vehemently with Nixon's refusal to spend funds authorized by Congress for social programs. Chosen to head the seven-member committee investigating the Watergate Scandal, he became something of a folk hero for his unceasing pursuit of evidence

against White House claims of executive privilege. His earthy humour, distinctive accent, and unflinching charm made him a popular figure throughout the televised hearings.

After more than 20 years in the Senate, Ervin declined to run for reelection in 1974 and returned to his hometown of Morganton, N.C., the next year to resume private legal practice. He wrote two books: *The Whole Truth: The Watergate Conspiracy* (1980), his version of the eventual triumph of the U.S. Constitution in the Watergate ordeal, and *Humor of a Country Lawyer* (1983).

Ervine, Saint John, in full SAINT JOHN GREER ERVINE (b. Dec. 28, 1883, Belfast, Ire.—d. Jan. 24, 1971, London, Eng.), British playwright, novelist, and critic, one of the first to write dramas in the style of local realism fostered by the Irish literary renaissance.

Eryops

By courtesy of the trustees of the British Museum (Natural History), photograph, Imlitor

Ervine's best-known plays are *Mixed Marriage* (first performed 1911) and the domestic tragedies *Jane Clegg* (1913) and *John Ferguson* (1915). In 1915 he became associated with the Abbey Theatre. After World War I, Ervine settled in London and was a drama critic for *The Observer*. He wrote such books on drama as *The Organized Theatre* (1924) and *The Theatre in My Time* (1933). Later plays included such comedies as *The First Mrs. Fraser* (1928), a rousing London success; *Robert's Wife* (1937); and a reactionary play on nationalization, *Private Enterprise* (1947).

Ervine also wrote biographies of Salvation Army general William Booth, Oscar Wilde, and George Bernard Shaw. His novels include *Francis Place*, *The Tailor of Charing Cross* (1912) and *Alice and a Family* (1915).

Erving, Julius, in full JULIUS WINFIELD ERVING II, byname DOCTOR J (b. Feb. 22, 1950, Roosevelt, N.Y., U.S.), American collegiate and professional basketball player who was one of the most colourful and exciting figures in the game during the 1970s and '80s.

While playing in high school Erving won an athletic scholarship to the University of Massachusetts. In three seasons there he became one of only seven players ever to average more than 20 points and 20 rebounds per game in a collegiate career. He was still generally unknown, however, when he joined the Virginia Squires of the American Basketball Association (ABA) in 1971. He was traded to the New York Nets two years later. In his five seasons in the ABA, Erving led the league in scoring three times, was the league's Most Valuable Player in its last three years, and led the Nets to championships in 1974 and 1976.

When the ABA merged with the National Basketball Association (NBA), the Nets traded Erving to the Philadelphia 76ers. Erving led the 76ers to the NBA finals four times in seven years, including their 1983 championship win. He was voted the NBA's Most Valuable Player in 1981. In 1980 he was one of 11 players named to the NBA's 35th-anniversary All-Time Team. He retired in 1987 after having become the third professional player to have scored a career total of 30,000 points. At 6 feet 6 inches (1.98 m), Erving played forward

and was noted for his fast breaks, balletic leaps toward the basket, and climactic slam dunks.

Eryops, genus of extinct primitive amphibians found as fossils in Permian rocks in North America (the Permian period occurred from 286 to 245 million years ago). *Eryops* was a massive animal more than 2 m (6 feet) long. Its large skull had thick and uneven bones, with wrinkles. The eye sockets were large and directed upward. Large and pointed teeth grew along the margins of the jaws and on the palate. The strength and size of the vertebral column and the skeletal limb elements indicate that *Eryops* was well suited to moving about on land. Although short, the limbs were very broad, and the shoulder and hip girdles were massive. The skin bore bony nodules that probably provided a sort of protective armour against predators. *Eryops* was a

predator that subsisted to a large extent upon fish, although it probably preyed upon land vertebrates as well.

erysipelas, contagious infection of the skin and underlying tissue, caused by group A B-hemolytic streptococcus bacteria. Erysipelas causes affected areas of skin to turn bright red and become slightly swollen. The swollen blotches have a distinct border and slowly expand into the surrounding skin. The lesions are most commonly seen on the face, scalp, hands, and legs. They feel hot to the touch and the patient is feverish.

Centuries ago erysipelas epidemics caused severe and often fatal infections. In AD 1089 one of the most severe epidemics was known as St. Anthony's fire because those who prayed to St. Anthony were said to recover; others, who did not, died. Today erysipelas is a rather mild and relatively rare infection that clears up rapidly when penicillin or other antibiotics are taken. Even without treatment the infection usually disappears in several weeks, but treatment is necessary to ensure against such potential complications as nephritis, subcutaneous abscesses, and blood poisoning (septicemia) from bacterial toxins. Antibiotic treatment also ensures against a recurrence of the infection and its transmission to others.

erysipelothrix infection, any of several infectious diseases caused by the widespread bacterium *Erysipelothrix rhusiopathiae*, found in water, soil, and decaying matter. Among the distinct diseases it causes are swine erysipelas (including diamond-skin disease), nonsuppurative arthritis in lambs and calves, post-dipping lameness in sheep, blood poisoning in poultry, and erysipeloid in humans. The bacterium is resistant to many common antiseptics but is destroyed by caustic soda and hypochlorites. Antibiotics, especially penicillin, afford control of these infections in livestock and poultry.

Erysipeloid, wound infection with *E. rhusiopathiae*, is a hazard to veterinarians, farmers, and animal handlers; it also yields to antibiotics.

erythema, any abnormal redness of the skin. Erythema is caused by dilation and irritation

of the superficial capillaries; the augmented flow of blood through them imparts a reddish hue to the skin. Erythema may arise from a great variety of causes and disease conditions. Blushing is a transient form of erythema.

From a medical point of view, the two major erythemas are erythema multiforme and erythema nodosum. Erythema multiforme is characterized by the sudden eruption of crops of red or violet flat spots, wheals, papules (small solid elevations), and vesicles (blisters), the characteristic lesions often having a concentric, or target, pattern; the skin on the palm of the hand and the mucous surfaces, especially the mouth and eyelids, are commonly involved. Erythema multiforme is believed to be a symptom complex that is secondary to a wide variety of underlying disease states. It may run a severe course and become life-threatening; in mild cases, the eruption is prone to recur. Variable success in treatment is obtained with the use of corticosteroid hormones.

Erythema nodosum is a hypersensitivity reaction most commonly associated with streptococcal infection, drugs (particularly oral contraceptives), and sarcoidosis (a systemic disease characterized by the formation of granulation, or scarlike, tissue). It is marked by the sudden onset of multiple, red, painful nodules in the deeper layer of the skin on the external surface of the lower legs. It most often affects young women. The nodules usually disappear spontaneously over a period of several weeks. Recurrences are uncommon. Treatment is usually of the underlying cause and may include complete bedrest, oral salicylates, and—in treatment of sarcoidosis—systemic corticosteroids.

Those erythematous conditions that are directly caused by specific agents include endemic erythema, or pellagra, due to a dietary deficiency of the vitamin niacin; and erythema ab igne, due to nonburning exposure to radiant heat.

Erythrae, ancient Ionic city on the Mimas (now Kara Burun) peninsula in western Turkey. The original site of traditionally Cretan and later Ionian settlement is uncertain, but from the 4th century BC the city was located at modern Ildir, where traces of the wall circuit, theatre, and citadel are visible.

About 453 BC Erythrae, refusing to pay tribute, seceded from the Delian League. A garrison and a new government restored the union, but late in the Peloponnesian War (412 BC) it revolted again with Chios and Clazomenae. Freed from Persian rule by Alexander in 334, it supported the *diadochos* Antigonus I Monophthalmus. A free city in the Roman province of Asia, Erythrae was noted for its wine, goats, timber, and millstones, as well as its prophetic sibyls, Herophile and Athenais.

erythrasma, a superficial skin infection marked by reddish brown scaly patches and attributed to the bacterium *Corynebacterium minutissimum*. The lesions are generally seen on the inner sides of the thighs, in the scrotum, in the toe webs, and in the armpits. Erythrasma is more likely to occur in a warm climate. It is usually effectively treated with broad-spectrum antibiotics, but (on the foot) only extensive washings with antibacterial soap may be effective.

erythrite, also called COBALT BLOOM, arsenate mineral in the vivianite group, hydrated cobalt arsenate [$\text{Co}_3(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$]. Erythrite, which is used as a guide to the presence of cobalt-nickel-silver ores because of its crimson or peach-red colour, occurs as radiating crystals, concretions, or earthy masses in the oxidized zone of cobalt and nickel deposits. It forms a complete solid-solution series with annabergite, in which nickel replaces cobalt in the erythrite structure. As the nickel content increases, the colour lightens to white, gray,

Erythrite from Morocco (top) on skutterudite and (bottom) with cobalt ore

By courtesy of the Field Museum of Natural History, Chicago; photograph, John H. Gerard

or pale green. Erythrite occurs in Schneeberg, Ger.; Allemont, France; Cornwall and Cumberland, Eng.; Chile; Morocco; and the southwestern United States. For detailed physical properties, see arsenate mineral (table).

erythroblastosis fetalis, also called HEMOLYTIC DISEASE OF THE NEWBORN, type of anemia in which the red blood cells (erythrocytes) of a fetus are destroyed as a result of a maternal immune reaction resulting from an incompatibility between a blood group of the fetus and its mother. This condition arises when the fetus inherits a certain blood factor (antigen) from the father that is absent in the mother. Symptoms of this disorder can range from mild to severe, and death sometimes results.

Primarily two blood group systems, rhesus (Rh) and ABO, are associated with erythroblastosis fetalis. The Rh system is responsible for the most severe form of the disease, Rh hemolytic disease, which can occur when an Rh-negative woman conceives an Rh-positive fetus. Sensitization of the mother's immune system (immunization) occurs when fetal red blood cells that carry the Rh antigen lacking in the mother's erythrocytes cross the placental barrier and enter the mother's bloodstream. They stimulate the production of antibodies, some of which pass across the placenta, entering the fetal circulation and lysing red blood cells (hemolysis). It is rare for the mother to become sensitized during the course of a first Rh-positive pregnancy because the amount of fetal Rh antigen that enters maternal circulation is insufficient to cause sensitization; only during labor will exposure be significant. However, because Rh sensitivity is likely to develop at this stage, the risk of the disease developing in subsequent Rh-positive pregnancies increases. This risk can be obviated if after each Rh-positive pregnancy the mother receives an injection of anti-Rh antibody, which destroys fetal red blood cells in her bloodstream. The fetus also is protected from Rh hemolytic disease if an ABO blood group incompatibility exists concurrently; protection is conferred by ABO antibodies, which destroy fetal blood cells in the maternal circulation before the mother develops Rh sensitivity. Fetal-maternal incompatibilities within the ABO blood group alone are more common than those of the Rh type, but the immune reaction is usually much less severe unless the fetus is type A and the mother type O.

The severity of erythroblastosis fetalis in the fetus varies depending on the degree of hemolysis. Clinical features include anemia, with the presence of many immature red blood cells (erythroblasts) in the circulation, jaundice, resulting from a buildup of bilirubin (a breakdown product of hemoglobin from

red blood cells), and an enlarged liver and spleen. In its mildest form the disease manifests only as slight anemia with no other complications; in its most extreme form the fetus dies in utero. Hydrops fetalis, which is characterized by extreme edema (abnormal accumulation of serous fluid) and congestive heart failure, is the most severe form of the disease in newborns. The infant usually dies unless an exchange transfusion, in which the Rh-positive blood of the infant is replaced completely by Rh-negative blood, is successful. Another devastating complication of the disease is kernicterus, which is caused by deposition of bilirubin in the brain. Hearing loss, mental retardation, or death may result. Nevertheless, many procedures are available to avert these consequences. If it is determined that the fetus is at risk for developing the hemolytic disease, amniocentesis can be used to measure bilirubin concentrations to predict the severity of disease. If levels are elevated, intrauterine transfusions of Rh-negative blood can be given until premature delivery can be induced. These measures, together with the use of anti-Rh antibody, have almost eliminated the incidence of erythroblastosis fetalis in developed countries.

erythrocyte, also called RED BLOOD CELL, or RED CORPUSCLE, component of blood, millions of which in the circulation of vertebrates give the blood its characteristic colour and carry oxygen from the lungs to the tissues. The mature human erythrocyte is small, round, and biconcave; it appears dumbbell-shaped in profile. The cell is flexible and assumes a bell shape as it passes through extremely small blood vessels. It is covered with a membrane composed of lipids and proteins, lacks a nucleus, but contains hemoglobin—a red, iron-rich protein that binds oxygen.

Human red blood cells (erythrocytes)

Manfred Kage—Peter Arnold

The function of the red cell and its contained hemoglobin is to carry oxygen from the lungs or gills to all the body tissues and to carry carbon dioxide, a waste product of metabolism, back to the lungs, where it is excreted. In invertebrates, oxygen-carrying pigment is carried free in the plasma; its concentration in corpuscles in vertebrates, so that oxygen and carbon dioxide are exchanged as gases, is more efficient and represents an important evolutionary development. The mammalian erythrocyte is further adapted by lacking a nucleus—the amount of oxygen required by the cell for its own metabolism is thus very low, and most oxygen carried can be freed into the tissues. The biconcave shape of the cell allows oxygen exchange at a constant rate over the largest possible area.

The erythrocyte develops in bone marrow in several stages: from a multipotential cell in the mesenchyme, a hemocytoblast, it becomes an erythroblast (normoblast); during two to five days of development, the erythroblast gradually fills with hemoglobin, and its nucleus and mitochondria (particles in the cytoplasm that

provide energy for the cell) disappear. In a late stage the cell is called a reticulocyte, which ultimately becomes a fully mature erythrocyte. The average red cell in humans lives 100–120 days; there are some 5.2 million red cells per cubic millimetre of blood in the adult human.

Though red cells are usually round, a small proportion are oval in the normal person, and in certain hereditary states a higher proportion may be oval. Some diseases also display red cells of abnormal shape—e.g., oval in pernicious anemia, crescent-shaped in sickle-cell anemia, and with projections giving a thorny appearance in the hereditary disorder acanthocytosis. The number of red cells and the amount of hemoglobin vary among different individuals and under different conditions; the number is higher, for example, at high altitudes and in the disease polycythemia. At birth the red cell count is high; it falls shortly after birth and gradually rises to the adult level at puberty. Red cells are formed continuously by the body, mostly in the bone marrow in the adult, and are stored in the spleen.

erythromelalgia (medicine): see erythromelalgia.

erythromycin, antibiotic synthesized by a soil organism, *Streptomyces erythraeus*. Erythromycin, which interferes with the synthesis of certain vital proteins in some microorganisms, may be either bacteriostatic (i.e., it inhibits bacterial reproduction but does not kill bacterial cells) or bactericidal (i.e., it kills bacteria by direct action), depending on its concentration and the type of microorganism against which it is used. Among the disease-causing agents susceptible to erythromycin are *Staphylococcus aureus* (the pus-producing bacterium) and several species of *Streptococcus* (bacteria that cause throat infections, pneumonia, sinusitis, and other diseases).

Erythronium, genus of about 20 species of spring-blooming plants of the family Liliaceae, commonly known as dog's tooth violet. All the species are native to North America except for the purple- or pink-flowered dog's tooth violet of Europe (*E. dens-canis*). The nodding flowers, usually one to a plant or in small clusters, range in colour from white to purple.

Dog's tooth violet (*Erythronium*)

Nelson Groffman

The two leaves, borne at the base of the plant, often are covered with white or brown spots. The fruit is a pod. The common dog's tooth violet, or adder's tongue, of North America is *E. americanum*. It has yellow flowers and brown-mottled leaves. Several species of *Ery-*

thronium are grown as rock-garden ornamentals.

Erzberger, Matthias (b. Sept. 20, 1875, Bittenhausen, Württemberg, Ger.—d. Aug. 26, 1921, Black Forest, Baden), leader of the left wing of the Roman Catholic Centre Party in Germany and signatory of the Armistice of World War I.

The son of a craftsman, Erzberger turned from teaching school to journalism with the Centre newspaper, *Deutsches Volksblatt*, and worked his way up in the Centre Party in Württemberg. He became a member of the Reichstag in 1903 and gradually established himself as the leader of the party's left wing. His sensational attack on Bernhard von Bülow's government over conditions in Germany's African colonies forced the dissolution of the Reichstag in December 1906. During World War I, although Erzberger at first favoured extensive annexations by Germany, he was decisively involved in the Reichstag resolution of July 19, 1917, proposing a negotiated peace with no territorial gains, and also in the events leading to the resignation of Chancellor Theobald von Bethmann Hollweg, whom he wanted replaced by Bülow. As leader of the new Reichstag majority (Centre, Social Democrats, Progressive People's Party), he aimed at democratic constitutional reform for Germany. While approving the Treaty of Brest-Litovsk (1918), Erzberger demanded opportunities for self-determination for eastern Europeans. Even during the war, in his book *Der Völkerbund* (1918), he supported the idea of a League of Nations. Erzberger headed the German deputation to the Truce Commission of Compiègne, Fr., where, on November 11, he signed the Armistice.

He served under Philipp Scheidemann in Germany's first republican government and vigorously pressed for acceptance of the Versailles Treaty. From June 1919 to March 1920 he was vice chancellor and finance minister under Gustav Bauer. His fiscal reforms were opposed both by the former propertied classes and by the federalists, who regarded them as steps toward a unitary state.

As a signatory of the Armistice and a protagonist of the republican-democratic system, Erzberger became the victim of a slander campaign from the extreme right. In March 1920 he was successful in a lawsuit against Karl Helfferich, who accused him of political corruption. Receiving only paltry damages, however, Erzberger resigned his ministry. The Centre failed to provide Erzberger with adequate support during these attacks upon him, and after his resignation he was neglected by the party. While on holiday in the Black Forest, he was shot dead by members of a nationalist organization.

Erzebet (Hungarian personal name): see under Elizabeth.

Erzgebirge, Czech KRUŠNÉ HORY, English ORE MOUNTAINS, range of hills bounding the Bohemian Massif, extending for 100 miles (160 km) along the German-Czech border, and reaching an average width of 25 miles (40 km). The Bohemian (southeastern) side of the range has a steep scarp face (2,000 to 2,500 feet [600 to 750 m] high in places); the outer slope to the northwest is gradual. The highest summits, Klínovec (4,081 feet [1,244 m]) on the Czech side and Fichtel Mountain (3,983 feet [1,214 m]) on the German side, are in the centre of the range. Loučná (3,136 feet [956 m]) is at the northeastern end and Špičák (3,658 feet [1,115 m]) at the southwestern end. The name of this range rightly suggests the tradition of mineral wealth, worked by generations of small groups of craftsmen (gold and silver, lead and copper, tungsten [wol-

fram], and pitchblende). The ores in the hills attracted medieval immigrant groups of German miners from the northwest, who, until their expulsion after World War II, gave the whole area a largely German character and tradition. To the original mining economy the Germans added forestry, furniture making, textile industries, and some farming. The main feature of settlement on both sides of the range was small-scale towns. After 1945 the almost wholly German population was supplanted by an almost wholly Czech one. Certain parts, such as the western extension into German territory, suffered large population losses. After World War II the uranium deposits at Jáchymov (then in Czechoslovakia) and Aue (then in East Germany) were developed. Large quantities of brown coal are mined around Chomutov and Most in the Bílina River valley, Czech Republic.

Road communications across the Erzgebirge are good. There are also railway routes, but the sinuous and frequently dead-end tracks on the Bohemian side show the obstacle posed by the great scarp face. The numerous mineral springs and winter sports resorts in the Erzgebirge have aided the development of the tourist industry.

Erzincan, city, eastern Turkey, on the northern bank of the Kara River, a major tributary of the Euphrates. The city is situated in a fertile plain, 3,900 feet (1,200 m) above sea level, enclosed by snowcapped mountains. It was taken by the Seljuq Turks from Byzantium in 1071, fell to the Mongols in 1243, and, after the collapse of the Mongol empire, was ruled by various local Turkmen dynasties until its final incorporation into the Ottoman Empire in the early 16th century. At the end of the 19th century, with its woolen-textile and leather industries, Erzincan was an important centre of eastern Anatolia, but its industries and population suffered from Armenian riots and occupation by Russian forces during World War I. Erzincan has frequently been damaged by severe earthquakes, most recently in 1939. Its industries include cotton and silk textiles, copper utensils, and medicines. The city occupies an important position on the rail line and highway from the Caucasus to central Anatolia and from Ankara to Erzurum; it is also linked by air with Ankara and Erzurum.

The surrounding region has severe winters and warm summers. The fertile plain is well watered and produces cotton, cereals, and fruits, and livestock raising is important. Pop. (1990 prelim.) city, 90,799.

Erzurum, city, eastern Turkey. It lies 6,400 feet (1,950 m) above sea level in a fertile plain surrounded by high mountains. On a caravan route from Anatolia to Iran, Erzurum has been a major commercial and military centre since antiquity and is now a major rail station on the route between Ankara and Iran.

Mountainous terrain near the city of Erzurum, Tur.

H. Knaus—Bavaria-Verlag

Although its foundation was probably much earlier, Erzurum achieved real importance as Theodosiopolis, a 5th-century-AD Byzantine fortress that fell to the Arabs in 653. Thereafter it was disputed among the Byzantines, Arabs, and Armenians until taken by the Seljuq Turks in 1071; it prospered in the early 13th century under Seljuq sultans. The Arabs and the Turks called it Arzan ar-Rûm, or Arz ar-Rûm ("Land of the Romans"), from which its present name is derived. It came under Ottoman control in 1515. The city was occupied by Russian forces in 1829, 1878, and 1916–18. It was in Erzurum, in July 1919, that Mustafa Kemal (later Atatürk) presided over the first Turkish nationalist congress, leading to the establishment of the Turkish Republic.

Historically important buildings include Seljuq theological colleges (1253 and 1308), the Great Mosque (12th century), and royal mausoleums (12th and 13th centuries). There is a local archaeological museum. Erzurum is the seat of Atatürk University (1957). It is important as a centre for trade in livestock, but it has little industry other than a sugar-beet factory; local craftsmen still excel in metalwork and saddlery. The city has a large Kurdish population.

The surrounding region is drained by the Karasu River, a headstream of the Euphrates, and the Aras and Çoruh rivers. Agricultural products include wheat, barley, millet, sugar beets, and vegetables. Pop. (1985) 246,053.

Es-Suweida (Syria): see Suwaydâ', As-.

Esagila, most important temple complex in ancient Babylon, dedicated to the god Marduk (*q.v.*), the tutelary deity of that city. The temple area was located south of the huge ziggurat called Etemenanki; it measured 660 feet (200 m) on its longest side, and its three vast courtyards were surrounded by intricate chambers. The whole complex reflects centuries of building and rebuilding by the Babylonian kings, especially Nebuchadrezzar II (reigned 604–562 BC). The tremendous wealth of Esagila was recorded by the Greek historian Herodotus, who is believed to have visited Babylon in the 5th century BC. Babylon was excavated in 1899–1917 by German archaeologists; few objects of value, however, were found in Esagila, which had been thoroughly plundered in antiquity.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Esaki, Leo, original name **ESAKI REIONA** (b. March 12, 1925. Ōsaka, Japan), Japanese solid-state physicist and researcher in superconductivity who shared the Nobel Prize for Physics in 1973 with Ivar Giaever and Brian Josephson.

Esaki was a 1947 graduate in physics from Tokyo University and immediately joined the Kobe Kogyo company. In 1956 he became chief physicist of the Sony Corporation, where he conducted the experimentation that led to the Nobel Prize. In 1959 he received his Ph.D. from Tokyo University.

Esaki's work at Sony was in the field of quantum mechanics and concentrated on the phenomenon of tunneling, in which the wave-like character of matter enables electrons to pass through barriers that the laws of classical mechanics say are impenetrable. He devised ways to modify the behaviour of solid-state semiconductors by adding impurities, or "doping" them. This work led to his invention of the double diode, which became known as the Esaki diode. It also opened new possibilities for solid-state developments that his co-recipients of the 1973 prize exploited separately. In 1960 Esaki was awarded an IBM

(International Business Machines) fellowship for further research in the United States, and he subsequently joined IBM's research laboratories in Yorktown, N.Y. He retained his Japanese citizenship.

Esarhaddon, also spelled **ESSARHADDON**, Assyrian **ASHUR-AHA-IDDINA** ("Ashur Has Given Me a Brother") (fl. 7th century BC), king of Assyria 680–669 BC, a descendant of Sargon II.

Esarhaddon, detail of a tablet from Zincirli Hüyük, in Turkey; in the Vorderasiatisches Museum, Berlin

By courtesy of the Vorderasiatisches Museum Staatliche Museen zu Berlin

Esarhaddon is best known for his conquest of Egypt in 671.

Although he was a younger son, Esarhaddon had already been proclaimed successor to the throne by his father, Sennacherib, who had appointed him governor of Babylon some time after Sennacherib sacked that city in 689. Sennacherib was murdered (681) by one or more of Esarhaddon's brothers, apparently in an attempt to seize the throne. Marching quickly from the west, Esarhaddon encountered the rebel forces in Hanigalbat (western Assyria), where most of them deserted to him, and their leaders fled. Esarhaddon continued on to Nineveh, where he claimed the throne without opposition.

In southern Babylonia, meanwhile, the leader of a Chaldean tribe took advantage of the revolt and attacked the Assyrian governor at Ur. When Esarhaddon sent troops against the chieftain, he fled northeastward, expecting to find asylum in Elam. Instead the new Elamite king summarily executed him. The rebel's brother, however, escaped to Assyria and submitted to Esarhaddon, who appointed him a local ruler in his dead brother's place. This rare instance of Assyrian mercy bore rich dividends, for he remained loyal throughout Esarhaddon's reign.

The cities of northern Babylonia, which had suffered severely under Sennacherib, were shown particular favour under Esarhaddon. He restored land to displaced citizens who could make good their claims, and in 678 he took military action against a Chaldean tribe that had encroached on the lands of Borsippa and Babylon.

Farther north the pressure of Cimmerians and Scythians was being increasingly felt. Esarhaddon is said to have made a marriage alliance with the Scythians to strengthen his position there. The pressure of the Cimmerians continued, however, and Esarhaddon finally lost control of much of the northwestern provinces of Cilicia and Tabal.

When Egypt inspired a revolt of the Phoenician city of Tyre, Esarhaddon attacked Egypt (675); he had little success until 671, when he seized Memphis and defeated the Egyptian

king Taharqa, who fled south, leaving the entire country to Esarhaddon. For the first time a Mesopotamian ruler included "king of Egypt" among his royal titles. After the withdrawal of the Assyrian army, Taharqa emerged and attracted a considerable following. Esarhaddon was marching to put down the rebellion in 669 when he died. In 672 Esarhaddon had proclaimed detailed instructions for the succession of two of his sons to the thrones of Assyria and Babylonia, and at his death the successions were carried out smoothly.

Esau, also called **EDOM**, in the Old Testament (Genesis 25:19–34; 27; 28:6–9; 32:3–21; 33:1–16; 36), son of Isaac and Rebekah, elder twin brother of Jacob, and in Hebrew tradition the ancestor of the Edomites.

At birth, Esau was red and hairy, and he became a wandering hunter, while Jacob was a shepherd. Although younger, Jacob dominated him by deception. At one time, when Esau returned from an unsuccessful hunt and was hungry, Jacob bought Esau's birthright (*i.e.*, the rights due him as the eldest son) for some red pottage (soup). When Isaac was dying, Jacob, with Rebekah's help, cheated Esau out of his father's blessing. Esau would have killed Jacob, but Jacob fled; when he returned 20 years later, Esau forgave him.

The story reflects the relationship of Israel and Edom. It sought to explain why Israel (in the time of the United Monarchy) dominated the kingdom of Edom, although the latter was older.

Esbjerg, city, Ribe *amtskommune* (county commune), southwestern Jutland, Denmark, opposite Fanø Island on the North Sea. Founded in 1868, after the loss of North Slesvig (Schleswig) to Germany, to provide a new export outlet for Jutland's agricultural produce, it grew rapidly after the harbour was completed in 1874 and was chartered in 1899. Esbjerg is Denmark's largest fishing port with 6 miles (10 km) of quay as well as shipbuilding facilities. In addition to fish products, large quantities of meat and dairy products are exported, chiefly to Great Britain. The city has teachers', technical, and commercial colleges; a folk high school; the National Marine and Fishery School; and a small airport. On the

Landing a fish catch in the harbour of Esbjerg, Den. Wedigo Ferchland

northwestern outskirts are the graves of nearly 300 Allied airmen shot down over Denmark during World War II. Pop. (1989 est.) mun., 81,480.

Esbo (Finland): see Espoo.

Escalante, (Francisco) Silvestre Velez de (fl. 1768–79), Spanish Franciscan missionary-explorer, who in 1776–77 with his superior

Francisco Domínguez, while seeking a route to Monterey in California from Santa Fe (now in New Mexico), rediscovered the Grand Canyon (Arizona). He explored what is now western Colorado and made the first Spanish penetration of what is now Utah (in which he recommended colonization), before returning, unsuccessful in his route search, to Santa Fe.

escalator, moving staircase used as transportation between floors or levels in subways, buildings, and other mass pedestrian areas.

An inclined belt, invented by Jesse W. Reno of the United States in 1891, provided transportation for passengers riding on cleats attached to the belt, which was inclined at an angle of 25°; the handrail was stationary, but an improved version with a moving handrail was introduced the same year.

The name escalator was first applied to a moving stairway shown at the Paris Exposition of 1900. Originally a trademark of the Otis Elevator Company, the word was adjudged in 1949 to have become public property through popular use.

Modern escalators are usually inclined at 30°, limited in rise to about 60 feet (18 m), with floor-to-floor rise of about 12 feet (3.5 m). They are electrically powered, driven by chain and sprocket, and held in the proper plane by two tracks. As the treads approach the landing, they pass through a comb device; a deflection switch is actuated to cut off power if an object becomes jammed between the tread and the comb.

Escalators move at a rate of up to 120 feet (36 m) per minute; larger types have a capacity of 6,000 passengers per hour. If a chain breaks, the release of tension stops the escalator. A safety switch also halts the device if a handrail is broken or comes loose or if a side panel is deflected.

Moving ramps or sidewalks, sometimes called travelators, are specialized forms of escalators developed to carry people and materials horizontally or along slight inclines. Ramps may have either solid or jointed treads or a continuous belt. Ramps can move at any angle of up to 15°; beyond this incline the slope becomes too steep and escalators are favoured.

Escallonia, genus of South American evergreen trees and shrubs in the family Grossulariaceae, order Rosales, comprising about 50 species. Members of the genus are found mainly in mountainous areas—notably in the Andes Mountains—although species in the temperate, southernmost portions of the range grow near the sea. Shiny-leaved *Escallonia* shrubs (e.g., *E. langleyensis*) are cultivated for their attractive, often aromatic, clusters of white, pink, or red flowers.

Escallonia langleyensis
Valerie Finnis

escallop (mollusk): see scallop.

Escanaba, city, seat (1861) of Delta county, southern Upper Peninsula of Michigan, U.S., and a port on Little Bay de Noc, an inlet of Green Bay, 54 miles (87 km) north-northeast of Menominee. Lumber operations began there in the 1830s. The community, named Escanaba (Chippewa Indian: "red buck," or "flat rock"), developed rapidly after 1863, when the Chicago and North Western Railway Company built the first iron-ore dock; the only one on Lake Michigan, it became important with the growth of the Chicago steel industry. The city has timber-based industries and is a distribution centre with facilities for storage and shipment of coal and petroleum products. The Upper Peninsula State Fair is an annual (August) event. Escanaba is the headquarters of Hiawatha National Forest and is the site of Bay de Noc Community College (1963). Inc. city, 1883. Pop. (1992 est.) 13,866.

escape velocity, in astronomy and space exploration, the velocity that is sufficient for a body to escape from a gravitational centre of attraction without undergoing any further acceleration. Escape velocity decreases with altitude and is equal to the square root of 2 (or about 1.414) times the velocity necessary to maintain a circular orbit at the same altitude. At the surface of the Earth, if atmospheric resistance could be disregarded, escape velocity would be about 11.2 km (6.96 miles) per second. The velocity of escape from the less massive Moon is about 2.4 km per second at its surface. A planet (or satellite) cannot long retain an atmosphere if the planet's escape velocity is low enough to be near the average velocity of the gas molecules making up the atmosphere.

escapement, in mechanics, ratchet device that permits motion in steps in one direction only; also the mechanism that causes a piano hammer to rebound after striking. In a watch or clock it is the mechanism that controls the transfer of energy from the power source to the counting mechanism. The classic form for a timepiece, which made the mechanical clock possible, was the verge escapement invented in 14th-century Europe. This consists of a notched crown wheel (i.e., a gear wheel shaped like a crown) driven by a weight or pendulum and repeatedly checked by the retarding action of a pair of metal leaves that alternately catch in successive notches. The leaves are mounted on a vertical shaft, and their speed of oscillating back and forth is governed by a crossbar at the top with two small weights; moving the weights outward from the shaft slows the oscillations. The anchor escapement was an improved escapement invented in England in the 17th century. In this the wheel is braked by a flat device in the shape of an inverted anchor, lying in the same plane as the wheel. Various improvements have since been made in escapements, but the principle remains unchanged.

Escaut River (Europe): see Schelde River.

Esch-sur-Alzette, town, southern Luxembourg, on the upper Alzette River, southwest of Luxembourg city, near the French border. A small village until 1870, it has become the second largest town in Luxembourg, largely because of the local phosphoric iron ore. The centre of the country's iron and steel industry, it has several large steelworks located on its outskirts and in the surrounding area. Slag fertilizer is a by-product. The town also has an important foodstuffs industry. Pop. (1990) 24,012.

eschar (glacial landform): see esker.

eschatology, the doctrine of last things, especially in Judaism and Christianity, concerning beliefs about the end of history, the resurrection of the dead, the Last Judgment, and related matters. Similar concepts are found in other Western religions (Islam and Zoroastrianism) and in the religions of nonliterate peoples, ancient Mediterranean and Middle Eastern cultures, and Eastern civilizations.

A brief treatment of eschatology follows. For full treatment, see MACROPAEDIA: Doctrines and Dogmas, Religious.

By and large, eschatologies have appeared in two radically divergent forms, distinguished by their attitude toward time and history. In mythical eschatologies, so called after their characteristic representations of the eternal struggle between cosmos (order) and chaos (disorder), the meaning of history is found in a celebration of the eternity of the cosmos and the repeatability of the origin of the world. Historical eschatologies, on the other hand, are grounded not in a mythical primal happening but in historically datable events that are perceived as key experiences fundamental for the progress of history.

Eschatological motives are found in almost all religions of the world. Buddhist eschatology is revealed in the yearning for redemption from the suffering inherent in the cycle of rebirth, whereby all creatures are reborn continually in forms dependent on the moral content of their past deeds. Redemption is achieved through the attainment of the condition of eternal peace known as Nirvāna (enlightenment; literally, "extinction"). Hinduism posits a similar redemption from endless cycles of existence, rebirth, and suffering, in this case through the soul's recognition of its eternal core, or essence (an awareness that has vanished from consciousness because of the soul's imprisonment in matter), and its consequent identification and union with absolute and eternal being.

Historical eschatology is basic to the Old Testament and thus enters into the structure of faith of those religions, primarily Judaism, Christianity, and Islam, that stem from it. Old Testament eschatology consists in the conviction that the catastrophes that beset the people of Israel and threatened their destruction were because of the Jewish people's disobedience to the laws and will of God. Subsequent conformity to the will of God would result in a return for the Jews to a final condition of righteousness and moral and material renewal, in which God's purpose would at last be fulfilled. Old Testament eschatology is closely bound to the concept of a redemptive history, in which the Jewish people are viewed as God's chosen instrument for the carrying out of his purpose and in which, upon the fulfillment of God's promises, the Jewish people would be the vehicle for both their own salvation and that of the rest of the world.

If for Judaism the peculiar eschatological event lies in the future, this future of God, according to the New Testament, has already begun with Christ. Christian eschatology is centred in the figure of Christ as the anticipation of the future Kingdom of God. Jesus is viewed as the Messiah of God, through whom and by whom the new age of God's redemption has at last been opened. The historical development of Christianity was subsequently marked by widely differing interpretations and degrees of acceptance of this original eschatology, however. Distinctions can be made between the hopes of messianism (directed toward a salvatory or vindicating figure to come), millenarianism (directed toward the prophesied 1,000-year Kingdom of Christ), and apocalypticism (directed toward the cataclysmic intervention of God in history). The diverse strands of 20th-century Christian theology are in agreement perhaps only in that

they regard faith itself, in its ultimate anticipation of God's redemption of creation, as being innately eschatological.

escheat, in feudal English land law, the return or forfeiture to the lord of land held by his tenant. There were generally two conditions by which land would escheat: the death of the tenant without heirs or the conviction of the tenant for a felony. In case of felony, the land would lose its inheritability and escheat to the lord, who would then hold the land subject to the crown's right to exploit the felon's lands for a year and a day. In time, this exploitation right of the crown was commuted in return for a money payment or service rendered to the crown by the lord. In the case of a tenant convicted of high treason, however, his land escheated directly to the crown, and the lord forfeited all rights he had in that tenant's lands completely. The escheat of lands for felony was abolished by statute in England in 1870; and by a statute enacted in 1925, no longer does land escheat to its former owner solely for failure of heirs. In the United States, laws passed in all states provide that land will escheat to the state (county or city) if an owner dies without a valid will and if no heirs can be found. *See also* attainder.

Escher, Alfred (b. Feb. 20, 1819, Zürich—d. Dec. 6, 1882, Zürich), dominant figure in 19th-century Zürich politics and legislator of national prominence who, as a railway magnate, became a leading opponent of railway nationalization.

Quickly rising in cantonal political affairs, Escher had by 1848 become president of the Zürich government. Elected the same year to the Nationalrat (national assembly), he was four times its president, notably during the Neuchâtel crisis with Prussia (1856–57). Often a voice for moderation against the advocacy of radical measures by Jakob Stämpfli, he tempered passions in the Neuchâtel affair and urged peaceful accommodation in the controversy arising from the cession of Savoy to France (1860).

Between 1850 and 1870 Escher was probably the most influential of all Swiss legislators. The head of a railway company, he championed private construction of railroads and opposed the nationalization program of Stämpfli (1862). The driving force behind the construction of the Gotthard line, he helped secure the necessary German and Italian cooperation for the project in 1869–71, and in 1871–78 he presided over its direction.

Escher (von der Linth), Hans Conrad (b. Aug. 24, 1767, Zürich—d. March 9, 1823, Zürich), Swiss scientist and politician who was president of the Great Council of the Helvetic Republic (1798–99) and who was an outspoken opponent of federalism. He directed the canalization of the Linth River.

With his friend and political colleague Paul Usteri, Escher founded the *Schweizer Republikaner*, a journal of moderately reformist opinion. Elected to the parliament of the fledgling Helvetic Republic in 1798, he was named president of the Great Council in the autumn of that year. Although a supporter of cantonal autonomy, he continued to hold high offices throughout the successive struggles between partisans of centralization and advocates of cantonal independence.

Following the reconstruction of the Swiss government by Napoleon (1803), Escher largely retired from the political arena but continued to participate in matters benefiting the public weal. He conceived the plan for canalization of the Linth River, the floodwaters of which frequently created pestiferous conditions, and superintended the subsequent canal construction (1808–22), later serving as a consultant for similar projects.

Escher, M(aurits) C(ornelis) (b. June 17, 1898, Leeuwarden, Neth.—d. March 27,

"Encounter," lithograph printed in black by M.C. Escher, 1944 (34.29 cm × 46.67 cm)

Collection, The Museum of Modern Art, New York City, gift of the International Graphic Arts Society

1972, Laren, Neth.), Dutch graphic artist, known for his prints that use realistic detail to achieve bizarre optical and conceptual effects.

Escher studied at the School of Architecture and Decorative Arts in Haarlem. Growing interested in graphics, he spent a number of years traveling and sketching throughout Europe. His works from this period treated landscape and natural forms in a fantastic fashion using conflicting perspectives. Escher's mature style as a printmaker emerged after 1937 in a series of prints that combined a meticulous realism with paradoxical visual and perspective effects. He exercised great technical virtuosity to portray unexpected metamorphoses of mundane objects. His images were of equal interest to mathematicians, cognitive psychologists, and the general public, and were widely reproduced in the mid-20th century.

Escher, Rudolf (George) (b. Jan. 8, 1912, Amsterdam—d. March 17, 1980, Texel, Neth.), Dutch composer and music theoretician especially noted for his chamber works.

Escher studied at the Rotterdam Conservatory from 1931 to 1937, but most of his early compositions were lost in the bombing of Rotterdam during World War II. During 1945 and 1946 he worked as a music editor for *De Groene Amsterdammer*. He held a variety of editorial and teaching posts from 1946 to 1964, at which time he began teaching contemporary music at the University of Utrecht. He is noted for his excellent essays on Claude Debussy and Maurice Ravel.

The first composition for which Escher received wide notice was an orchestral piece, *Musique pour l'esprit en deuil* (1943). Several instrumental and orchestral pieces followed, and in the 1950s and following years he composed a number of interesting vocal works, including *Strange Meeting* (1952; to words by Wilfred Owen), *Le vrai visage de la paix* (1953; to words by Paul Éluard), and *Songs of Love and Eternity* (1955; to words by Emily Dickinson). His chamber piece *Le tombeau de Ravel* (1952) was very well received. His later works include *Univers de Rimbaud* (1970), for orchestra and voices; *Sinfonia* for 10 instruments (1973–76); and *3 Poems* (1975; to words by W.H. Auden) for chamber chorus.

Eschweiler, city, North Rhine-Westphalia Land (state), western Germany, on the edge of the Eifel Mountains. First mentioned in the 9th century, it belonged to the duchy of Jülich until the French Revolutionary Wars and was annexed by Prussia in 1815. The chief city of the Aachen coal basin, its chief products include coal, iron, steel, limestone, textiles, and plastics. Pop. (1998 est.) 55,752.

Escobar y Mendoza, Antonio (b. 1589, Valladolid, Spain—d. July 4, 1669, Valladolid), Spanish Jesuit preacher and moral theologian who was derided for his support of probabilism, the theory according to which when the rightness or wrongness of a course of action is in doubt, any probable right course may be followed, even if an opposed course

appears more probable. The issue of probabilism became important in the 17th century, when social and cultural developments, such as banking, came into conflict with traditional moral precepts, resulting in many difficult tests of conscience.

Escobar entered the Society of Jesus in 1597 and became a distinguished scholar and noted preacher. His principal detractor over his support of probabilism was Blaise Pascal, French scientist and religious philosopher. Escobar is quoted with derision and indignation in Pascal's *Provincial Letters*, nos. v–ix. An opponent of the Jesuits, Pascal ridiculed Escobar and his confreres as teachers of lax moral principles who believed that the end justifies the means. He was also attacked by such noted French authors as Molière and Jean de La Fontaine. Some scholars find that these attacks are unfounded if Escobar's words are taken in context. His collected writings comprise 32 volumes on biblical, sacred, and moral subjects.

Escobedo, Juan de (d. March 31, 1578), Spanish politician, secretary to Don Juan of Austria.

Escobedo began his political life in the household of Ruy Gómez de Silva, prince of Eboli, but, after the Battle of Lepanto, entered the service of the victorious Don Juan and was with him when he became governor of Flanders (1576). In 1577 Escobedo went to Spain, probably with complaints to King Philip II about leakages of information from dispatches to Flanders involving the king's secretary, Antonio Pérez. For this reason, it is thought, Pérez made several attempts to murder Escobedo and finally, with the king's consent, succeeded in having him killed by bravos on the night of Easter Monday, 1578.

Escoffier, (Gorges-)Auguste (b. Oct. 28, 1846, Villeneuve-Loubet, Fr.—d. Feb. 12, 1935, Monte Carlo), French culinary artist known as "the king of chefs and the chef of kings," who earned a worldwide reputation as director of the kitchens at the Savoy Hotel (1890–99) and afterward at the Carlton Hotel, both in London.

Escoffier began his career at the age of 12, and when he retired from the Carlton Hotel at the age of 74, he counted 62 years of active service, a span considered a record in his profession. The name of Escoffier became of worldwide repute when in 1890 he was given the direction of the kitchens of the newly opened Savoy Hotel, and he created the *pêche Melba* (peach Melba) in honour of the famous singer Nellie Melba when she was staying there in 1893. In 1899 he moved to the Carlton Hotel, where he was to build up a fabulous reputation for haute cuisine during the next 23 years: on one occasion Emperor William II is reported to have said to Escoffier, "I am the emperor of Germany but you are the emperor of chefs." In recognition of his services to the prestige of French cooking abroad, he

Escoffier
H. Roger-Viollet

was awarded the Legion of Honour in 1920 and made officer of the order in 1928.

Besides the renown of his name, said to be greater even than that of Marie-Antoine Carême, Escoffier left several books, including *Le Carnet d'épique* (1911; "Notebook of a Gourmet"), *Le Guide culinaire*, cowritten with Philéas Gilbert and Émile Fetu (1903; *The Escoffier Cook Book*), *Le Livre de menus* (1912; "The Book of Menus"), and *Ma cuisine* (1934; "My Cuisine").

Escola Velha (Portuguese: "Old School"), Spanish dramatists in the early 16th century who were influenced by the Portuguese dramatist Gil Vicente.

Although in form Vicente was a medieval dramatist, his skill in comedy and character portrayal and the varied subject matter of his plays made him a forerunner of the modern drama. The best known of the playwrights stimulated by Vicente's innovations were Baltasar Dias, who wrote popular religious plays; António Ribeiro Chiado and his brother Jerónimo Ribeiro, writers of satirical farces; and António Prestes, who evinced a knowledge of folklore and the peasant life.

Escondido, city, San Diego county, southern California, U.S. Once part of the Rancho Rincón del Diablo, it was laid out in 1885 and named Escondido (Spanish: "Hidden") because of its secluded valley site. It became a processing-shipping point for fruits (especially avocados and grapes), wines, cereals, and dairy produce. After World War II there was light-industrial development. Immediately southeast, a state historical monument marks the site of the Battle of San Pasqual (1846), fought between the Californian forces of General Andrés Pico and the U.S. Army troops under Brigadier General Stephen W. Kearny. The Palomar Mountain Observatory is 20 miles (32 km) northeast in Cleveland National Forest. Inc. 1888. Pop. (2000) 133,559.

Escorial, El (Spanish village and monastery); see El Escorial.

Escravos River, distributary of the Niger River in the western Niger delta, southern Nigeria. Its 35-mile (56-kilometre) westerly course traverses zones of mangrove swamps and coastal sand ridges before entering the Bight of Benin of the Gulf of Guinea. There are no ports on the river, but the Escravos is linked by a maze of interconnected waterways to the Forcados, Warri, Benin, and Ethiopian rivers. By 1960, although the natural passage-way over the Escravos Bar at the ocean exit was only 12 feet (4 m) deep, the river had already supplanted the Forcados as the main approach to the Delta ports: Warri, Burutu, Sapele, Koko, and Forcados. Since the completion in 1964 of the Escravos Bar Project, the Escravos has provided the only route for oceangoing vessels to those ports. There is also a petroleum-shipping station serving a submarine oil field 11 miles (18 km) offshore from the mouth.

escritoire (furniture): see secretary.

Escrivá de Balaguer, Josemaría, SAINT, in full JOSEMARÍA ESCRIVÁ DE BALAGUER Y ALBÁS (b. Jan. 9, 1902, Barbastro, Spain—d. June 26, 1975, Rome; canonized Oct. 6, 2002), Spanish prelate of the Roman Catholic church, founder in 1928 of Opus Dei (*q.v.*), a Catholic organization of laymen and priests who strive to live Christian lives in their chosen professions. By the time of Escrivá's death in 1975, its members numbered some 60,000 in 80 countries, and its critics charged it with wielding undue power, especially in Spain during the rule of Francisco Franco.

The son of a businessman, Escrivá studied law at the University of Saragossa and attend-

ed the archdiocesan seminary there, becoming ordained on March 28, 1925. Except for a period during the Civil War when he was a refugee from the anticlerical Republicans, he remained in Madrid doing pastoral work until 1946. It was during this period (Oct. 2, 1928) that Escrivá is believed to have received a vision from God, which provided the inspiration for the foundation of his order. From that moment, Escrivá claimed, he dedicated himself to the creation of an order that spread holiness and sanctified daily work. In 1946 he moved to Rome. The following year he was promoted to the rank of monsignor, and from 1947 to 1950 he secured Vatican approval of Opus Dei, which was made a personal prelature by Pope John Paul II in 1982.

While in Rome, Escrivá participated in the discussions associated with the second Vatican Council. He also oversaw the establishment of vocational, trade, and agricultural centres, numerous high schools and schools of business administration, and the founding of the University of Navarre, which many considered the finest university in Spain. Members of the order were recruited by Franco when he needed highly trained technicians to implement a program of economic development. Although accused of elitism, secrecy, and cultlike practices, the order remained popular, and Escrivá moved rapidly toward sainthood. His canonization by John Paul II in 2002, only 27 years after his death, was one of the shortest waiting periods in church history.

escrow, in Anglo-American law, written instrument, such as a land deed, constituting evidence of obligations between two or more parties, that is given to a third party with instructions that he deliver the instrument only upon the happening of a certain condition. In commercial usage, this condition is most frequently the performance of an act, such as payment of the purchase price, by the party who is to receive the written instrument. Escrow is also commonly used in family transactions, in which, upon the happening of the condition, such as the death of a family member, certain written instruments will be delivered by the third party (escrowee) to another family member. The term is occasionally used to refer to the state or condition of a deed that is held conditionally by a third party, although escrow properly refers only to the written instrument itself.

Escudero, Vicente (b. Oct. 27, 1892, Valladolid, Spain—d. Dec. 4, 1980, Barcelona), Gypsy dancer widely respected for his mastery of flamenco dance and for his adherence throughout his public career to an authentic style rarely distorted or commercialized.

Known in his youth for his dancing in the cafés of Spain, Escudero performed in Paris in 1920 with his longtime partner Carmita Gar-

Escudero

By courtesy of the Dance Collection, the New York Public Library at Lincoln Center

cia at the Olympia Theatre. From 1922 to 1932 he toured Europe, dancing with Anna Pavlova in 1931, and in 1932 he first danced in the United States. He appeared as Carmelo

in La Argentina's production of the ballet *El amor brujo* (Madrid, Teatro Español, 1934). In 1954 he returned to Paris, and he toured the United States later that year, in 1959, and in 1961. He then retired from dancing, although he continued lecturing on flamenco.

Escuintla, city, southwestern Guatemala. It lies near the Guacalate River, on the southern flanks of the central highlands, at 1,109 feet (338 m) above sea level. It is located 28 miles (45 km) southwest of Guatemala City. Escuintla, one of Guatemala's largest cities, was a prominent political and trading centre for indigo during the 17th and 18th centuries. From the rich agricultural hinterland now come sugarcane, cotton, and coffee, as well as citronella, coconuts, pineapples, and mangoes. Beef cattle are also raised in the region. In the city are cotton-ginning and meat-packing plants; sugar refineries are in the vicinity. Escuintla is also a popular winter resort noted for its mineral baths. It lies on the Pacific Coast Highway and is served by a railroad and a nearby airport. Pop. (1994 prelim.) 49,026.

escutcheon, in furniture design, an armorial shield sometimes applied to the centre of pediments on pieces of fine furniture and, also, the metal plate that surrounds a keyhole or the pivoting metal plate that sometimes covers the keyhole. The keyhole escutcheon has been used on cabinets and desks since the European Middle Ages, the designs matching the other metal mounts, such as hinges, and varying according to the fashions of the day. Early escutcheons were of wrought iron and might be quite plain, simply serving to prevent wear. From the 17th century, brass, which could be worked in finer designs, was used on fine furniture. For the most lavish designs, ormolu was used, especially in 18th-century France.

Esdraelon, Plain of, also called VALLEY OF JEZREEL, Hebrew 'EMEQ YIZRE'EL, or HA-'EMEQ, lowland in northern Israel, dividing the hilly areas of Galilee in the north and Samaria (in the Israeli-occupied West Bank) in the south. *Esdraelon* is the Greek derivation of the Hebrew Yizre'el, meaning "God will sow," or "May God make fruitful," an allusion to the fertility of the area.

The plain, roughly triangular in shape, is oriented northwest-southeast with the apex at the northwest. The hills of Lower Galilee are to the northeast, the opening to the low Bet She'an valley is at the southeast, and the Samaritan hills and Carmel ridge are at the south and west. The length of the plain, from its apex to the Hare (mountains of) Gilboa' and the Bet She'an valley, is about 25 miles (40 km). The plain is a result of massive dislocation and block faulting, with subsequent subsidence; remnants of former mountains are Mount Carmel and Mount Tabor.

The plain is part of the ancient Via Maris, the passage between Egypt and the Fertile Crescent (a semicircle of relatively fertile land extending northward around the Syrian Desert and down the Tigris and Euphrates rivers to the Persian Gulf), and has been an avenue of commerce and a scene of conflict from remotest antiquity. The Bible (Joshua 17:16) tells of the Canaanite hold on the area; later, Gideon's armies defeated the Midianites and Amalekites there (Judges 6 and 7). On the slopes of Hare Gilboa' overlooking the plain, Saul and Jonathan were slain (1 Samuel 31; 2 Samuel 1). At the northwest is the site of ancient Megiddo, founded in the 4th millennium BC and the scene of battles from 1500 BC to AD 1918. Megiddo is also believed to be the site of the battle between the forces of evil and the forces of God at the end of history.

Owing to poor natural drainage and neglect, the plain was a sparsely inhabited swampland for many centuries. The sultans declared it Turkish crownland after their conquest of Palestine (1517), but by the beginning of the

20th century large areas had passed to Arab absentee landlords. The first Jewish settlement on the plain was Merhavva (1911). In 1920 the British lifted the land restrictions and large tracts were bought by Jews for reclamation and settlement. Palestine's first smallholder's cooperative (moshav), Nahalal, and first large kibbutz, 'En Hārod, were both founded there in 1921. Since then the swamps have been drained, and dozens of settlements, combining intensive agriculture with light industry, have been set up. The city of 'Afula (*q.v.*) is the principal urban centre.

Esdras, First Book of, also called GREEK EZRA, abbreviation I ESDRAS, apocryphal work that was included in the canon of the Septuagint (the Greek version of the Hebrew Bible) but is not part of any modern biblical canon; it is called Greek Ezra by modern scholars to distinguish it from the Old Testament Book of Ezra written in Hebrew. Originally written in Aramaic or Hebrew, I Esdras has survived only in Greek and in a Latin translation made from the Greek.

The work is textually more closely related to the Old Testament than other books of the Apocrypha, for it traces portions of Israel's history from 621 BC to 444 BC by summarizing II Chronicles 35:1–36:23, the whole of the canonical Book of Ezra, and Nehemiah 7:73–8:12. The only new material is the "Tale of the Three Guardsmen," a Persian folk story that was slightly altered to fit a Jewish context.

The method used in compiling I Esdras is uncertain, especially because of numerous historical inconsistencies and errors; in several instances it also alters biblical texts. The work was composed sometime in the 2nd century BC, probably by an Egyptian Jew.

Given the historical confusion of I Esdras, many scholars feel that its compiler was more interested in inculcating certain moral and religious ideas than in chronicling Jewish history. In this respect the most important part of the work is the "Tale of the Three Guardsmen," which asserts the supremacy of the Hebrew God, who is identified with truth. Also emphasized are the observance of the Mosaic Law, the cult of the Temple of Jerusalem, and laws forbidding the marriage of Jews with non-Jews.

The first identifiable quotations from I Esdras are in *The Antiquities of the Jews* of the 1st-century-AD Jewish historian Josephus, who used it in preference to the canonical Ezra–Nehemiah. The "Tale of the Three Guardsmen" was popular among early Christians, some of whom used its statement about truth to prove that this work prophesied the coming of Chrŕst.

Esdras, Second Book of, also called FOURTH BOOK OF EZRA, or EZRA APOCALYPSE, abbreviation II ESDRAS, apocryphal work printed in the Vulgate and many later Roman Catholic bibles as an appendix to the New Testament. The central portion of the work (chapters 3–14), consisting of seven visions revealed to the seer Salathiel-Ezra, was written in Aramaic by an unknown Jew around AD 100. In the mid-2nd century AD, a Christian author added an introductory portion (chapters 1–2) to the Greek edition of the book, and a century later another Christian writer appended chapters 15–16 to the same edition. It is possible that the whole Greek edition (from which all subsequent translations were derived, the Aramaic version having been lost) was edited by a Christian author, because there are passages in the central Jewish section that reflect Christian doctrines on original sin and Christology.

II Esdras is concerned primarily with the future age that will succeed the present world order. The occasion for its composition was the fall of Jerusalem to the Romans in AD 70, which had a drastic effect on the nationalistic aspirations of the Jews and on their view of Judaism.

The central theme of the work is the justification of the ways of God to man. The author, deeply concerned over the future of Jews deprived of the Temple of Jerusalem, challenges God to explain why the righteous suffer at the hands of sinners. The answers are similar to those in the Book of Job: the actions of God are inscrutable, human understanding is finite and limited, and God will always love his chosen people in spite of appearances to the contrary.

There is a marked dualistic motif in this work contrasting the present, evil-ridden world to a future, heavenly age when the righteous few who survive the final judgment will live in an immortal state.

Esdras and Nehemiah, books of: see Ezra and Nehemiah, books of.

Esen Taiji (d. 1455, Mongolia), Mongol chief who succeeded in temporarily reviving Mongol power in Central Asia by descending on China and capturing the Emperor.

In 1439 Esen became the chief of the Oyrat Mongols, living in the remote mountainous region in western Mongolia near Lake Baikal, from which had come some of Genghis Khan's most ferocious warriors. Esen began to follow in Genghis' footsteps, subjugating other Mongol tribes and extending his authority eastward until he came to rule the territory between the Great Wall of China and the Korean border.

In 1449 Esen stopped paying the tribute that the Chinese exacted from the Mongol tribes and mobilized his forces along the Chinese border. The Chinese government was then under the domination of the eunuch Wang Chen, who persuaded the Chen-t'ung emperor to take command of an army against Esen. Esen quickly surrounded the poorly led Chinese forces and captured the Emperor. After hesitating for a few months, he advanced to China proper and laid siege to Peking. The Chinese had meanwhile enthroned another emperor and prepared a cannon defense of the capital. Esen soon abandoned his siege and in 1450 released the captured emperor. Three years later he signed a peace treaty with the Chinese and resumed his tribute payments. Esen's son inherited his conquests, but Oyrat power soon declined.

Eset (Egyptian goddess): see Isis.

Eşfahān, also spelled ISFAHAN, major city of the Seljuq Turks (11th–12th century) and of the Safavid dynasty of Iran (16th–18th century), now a major city in west central Iran. It lies on the Zāyandeh River, about 210 miles (340 km) south of Tehrān.

Little is known of Eşfahān before Sāsānian times (c. AD 224–c. 651). In the 4th century a colony of Jews was said to have been established in the suburb of Yahūdiyeh. When the Arabs captured Eşfahān in 642, they made it the capital of al-Jibāl province. Togrŕl Beg, the Turkish conqueror and founder of the Seljuq dynasty, made Eşfahān the capital of his domains in the mid-11th century; under his grandson Malik-Shāh I (reigned 1073–92), the city grew in size and splendour. After the fall of the Seljuq dynasty (c. 1200), Eşfahān temporarily declined.

The city's golden age began in 1598 when Shāh 'Abbās I the Great (reigned 1588–1629) made it his capital and rebuilt it into one of the largest and most beautiful cities of the 17th century. In the centre of the city he created the immense Meydān-i Shāh (Royal Square) as well as the noted Masjid-i Shāh (Royal Mosque), which was not finished until after his death, and the Masjid-i Sheykh Lotfollāh (Lotfollāh Mosque). In 1722 the Ghilzay Afghans took the city after a long siege.

For many years the greater part of the city was a heap of rubble, and its population dwin-

dled to a fraction of what it had once been. Recovery began during the reign of Reza Shah Pahlavi (1925–41). An industrial quarter was built, and many of the historic buildings were

Dome of the Lotfollāh Mosque, Eşfahān, Iran
Laurence Lockhart

restored. Eşfahān, a major textile centre, is well known for its handicrafts and traditional manufactures of tiles, rugs, and cotton fabrics. More modern industries include steelmaking and petroleum refining. The city is the home of Eşfahān University (established 1936). Pop. (1985 est.) 1,121,200.

Eşfahān, Great Mosque of, Persian MASJED-E JĀME' ("Universal Mosque"), a complex of buildings in Eşfahān, Iran, that centres on the 11th-century domed sanctuary and includes a second smaller domed chamber, built in 1088, known for its beauty of proportion and design. The central sanctuary was built under the direction of Nizām al-Mulk, vizier to the Seljuq ruler Malik-Shāh, probably between 1070 and 1075. It stands at the south end of the courtyard. Its large brick dome is supported by 12 heavy piers.

The smaller dome stands at the north end of the courtyard. This single-shelled dome is a structural masterpiece that has survived centuries without damage. The room—made of small, gray, baked bricks—encloses an area approximately 30 feet (9.1 m) square and 60 feet (18.2 m) high. The dome rests on a series of arches, with 16 at the top and one broad arch framed between two narrow ones in each wall at room level. The mosque complex, framed by four huge *eyvāns*, or vaulted niches, includes structures built at various periods from the 11th century to the 18th—among them, private chapels, a school, a library, and a treasury.

Eşfahān school, last great school of Persian miniature painting, at its height in the early 17th century under the patronage of the Safavid ruler Shāh 'Abbās I (d. 1629). The Eşfahān school's leading master was Rezā 'Abbāsī, who was greatly influenced by the Kazvin school of portraiture, particularly the work of Šādiqi Beg (fl. late 16th century).

Rezā 'Abbāsī preferred naturalistic subjects and portraiture to the illustrative themes that had dominated Persian miniature painting for 200 years. His painting "Two Lovers" (Metropolitan Museum of Art, New York City) is among the most accomplished works of the Eşfahān school. Although there is an element

of stylization, the exquisiteness and delicacy of the hands, faces, and costumes infuse the painting with an impressionistic quality. The curved, plumpish figures are highly effeminate, in the tradition of the late Šafavid court. Rezā 'Abbāsī was also a master of line drawing, a form of art not popular in the Islāmic world before the end of the 16th century.

Painters of the Eṣfahān school imitated Rezā 'Abbāsī's style, and, although they never equaled the master, they produced much delightful work through the beginning of the 18th century. Among Rezā 'Abbāsī's best pupils were his son Moḥammad Shaffī and Mo'in Moṣavver.

"Khosrow Makes His Elephant Trample the Enemy," Eṣfahān school miniature by Rezā 'Abbāsī, 1680, from *Khosrow o-Shirīn* by Nezāmī (Victoria and Albert Museum, London, fol. 88)

By courtesy of the Victoria and Albert Museum, London

The Eṣfahān school lost its freshness after the master's death, and miniature painting in Iran declined.

Eshbaal (king of Israel): *see* Ishbosheth.

Eshkol, Levi, original name LEVI SHKOLNIK (b. Oct. 25, 1895, Oratov, near Kiev, Ukraine, Russian Empire—d. Feb. 26, 1969, Jerusalem [Israel]), prime minister of Israel from 1963 until his death.

Eshkol became involved in the Zionism movement while a student in Vilna, Lithuania. He moved to Palestine in 1914 when it was under Turkish rule, working there in a number of settlements. He fought as a member of the Jewish Legion on the side of the British forces against the Turks. At the end of his service in 1920, Eshkol helped found Deganya Bet, one of the first kibbutzim in Palestine. Thereafter he worked untiringly for the future Israeli state. He was one of the founders

of Histadrut (General Federation of Labour) and was instrumental during World War II in the movement of people and goods from Germany to Palestine.

After the State of Israel was established in 1948, Eshkol held several government positions, including that of minister of finance (1952–63). When in 1963 David Ben-Gurion announced his retirement as prime minister, Eshkol succeeded him. Two years later Ben-Gurion again sought the leadership, but Eshkol easily won the election.

The major event of Eshkol's governance was the Six-Day War (June 1967) against Egypt, Jordan, and Syria. With the help of such individuals as Golda Meir, Eshkol also unified Israel's three major labour parties into the Israel Labour Party.

Eshnunna, modern TALL AL-ASMAR, ancient city in the Diyālā River valley lying about 20 miles (32 km) northeast of Baghdad in east-central Iraq. The excavations carried out by

Statuettes found at Tall al-Asmar, Early Dynastic II (c. 2775–c. 2650 BC); in the Oriental Institute, the University of Chicago

By courtesy of the Oriental Institute, the University of Chicago

the Oriental Institute of the University of Chicago revealed that the site was occupied sometime before 3000 BC. The city expanded throughout the Early Dynastic Period, and during the 3rd dynasty of Ur the city was the seat of an *ensi* (governor). After the collapse of Ur, Eshnunna became independent but was later conquered by Hammurabi, king of Babylonia. During the next century the city fell into decline and may have been abandoned.

The "Laws of Eshnunna" are inscribed on two broken tablets found in Tall Abū Harmal, near Baghdad. The two tablets are not duplicates but separate copies of an older source. The laws are believed to be about two generations older than the Code of Hammurabi; the differences between the two codes help illuminate the development of ancient law.

Eskdale (Scotland): *see* Annandale and Eskdale.

esker, also spelled **ESKAR**, or **ESCHAR**, a long, narrow, winding ridge composed of stratified sand and gravel deposited by a subglacial or englacial meltwater stream. Eskers may range

Esker near Fort Ripley, Minn.

By courtesy of the Minnesota Geological Survey

from 16 to 160 feet (5 to 50 m) in height, from 160 to 1,600 feet (500 m) in width, and a few hundred feet to tens of miles in length. They may occur unbroken or as detached segments. The sediment is sorted according to grain size, and cross-laminations that show only one flow direction commonly occur. Thus eskers are considered to be channel deposits (left by streams that flowed through tunnels in and below the ice) that were let down onto the ground surface as the glacier retreated. Esker formation presumably takes place after a glacier stagnates, because movement of the ice would likely spread the material and produce ground moraine. Notable areas of eskers are found in Maine, U.S.; Canada; Ireland; and Sweden. Because of ease of access, esker deposits often are quarried for their sand and gravel for construction purposes.

Eski Dzhumaya (Bulgaria): *see* Türgovishte.

Eskilstuna, town, *län* (county) of Södermanland, southeastern Sweden, on the Eskilstuna River, west of Stockholm. Although it was a trade centre as early as the 12th century, it did not receive its charter until 1659. In the 17th and 18th centuries its iron and steel industry grew rapidly, soon rivaling that of Sheffield, Eng. Eskilstuna is still one of the chief centres of the Swedish metal industry, with cutlery and precision instruments of particular importance. Pop. (1995 est.) mun., 89,761.

Eskimo, any member of a group of peoples who, with the closely related Aleut, constitute the chief element in the native population of the Arctic and sub-Arctic regions of Greenland, Alaska, Canada, and far eastern Russia (Siberia).

A brief treatment of the Eskimo follows. For full treatment, *see* MACROPAEDIA: Arctic: *Peoples and cultures of the Western Arctic*.

Self-designations vary among the languages and dialects of the Eskimo peoples. They include such names as Inuit, Inupiat, Yupik, and Alutit, each of which is a regional variant of "the people" or "the real people." The name Eskimo, which has been applied to Arctic peoples by Europeans and others since the 16th century, originated in Montagnais, an Algonquian language. (Once erroneously thought to mean "eaters of raw flesh," the name, though still somewhat obscure, is now believed to make reference to snowshoes.) The Arctic peoples of Canada and Greenland in general prefer the term Inuit, while those of Alaska still generally favour the term Eskimo.

The oldest known Eskimo culture is that from a site on Umnak Island in the Aleutians, for which an age of 3,018 (plus or minus 230) years was recorded. In the late 20th century there were an estimated 117,000 self-described Eskimo: some 51,000 in Greenland and Denmark, 43,000 in Alaska, 21,000 in Canada, and about 1,600 in Siberia.

The Eskimo are an Asian people who are distinguishable from the American Indians by their more Asian features, by the relative smallness of their hands and feet, and by a few less obvious traits. Another distinguishing feature of the Eskimo is the appreciable percentage of the B blood type (ABO system), which seems to be totally absent from the American Indians. Because blood type is a very stable hereditary trait, it is believed that at least a part of the Eskimo population is of different origin from the Indians and that they are not, as scholars earlier thought, merely an Indian people who developed separately in the far north. The Eskimo-Aleut languages, of which there exist many dialects owing to the wide geographic area occupied by the Eskimo and Aleut, support this theory.

Traditional Eskimo culture was totally adapted to an extremely cold, snow- and ice-bound environment in which vegetable foods were almost nonexistent, trees were scarce, and cari-

bou, seal, walrus, and whale meat, whale blubber, and fish were the major food sources. The Eskimo used harpoons to kill seals, which they hunted either on the ice or from skin-covered, one-person canoes known as kayaks. Whales were hunted using larger boats called umiaks. In the summer most Eskimo families hunted caribou and other land animals with the help of bows and arrows. Dogsleds were the basic means of transport on land. Eskimo clothing was fashioned of caribou furs, which provided protection against the extreme cold. Most Eskimo wintered in either snow-block houses called igloos or semisubterranean houses of stone or sod over wooden or whalebone frameworks. In summer many Eskimo lived in animal-skin tents. Their basic social and economic unit was the nuclear family, and their religion was animistic.

Eskimo life changed greatly in the 20th century owing to increased contacts with societies to the south. Snowmobiles have generally replaced dogs for land transport, and rifles have replaced harpoons for hunting purposes. Outboard motors, store-bought clothing, and numerous other manufactured items have entered the culture, and money, unknown in traditional Eskimo economy, has become a necessity. Many Eskimo have abandoned their nomadic hunting pursuits to move into northern towns and cities or to work in mines and oil fields. Others, particularly in Canada, have formed cooperatives to market their handicrafts, fish catches, and ventures in tourism. *See also* Arctic.

Consult the INDEX first

Eskimo-Aleut languages, family of languages spoken in Greenland, Canada, Alaska, and eastern Siberia by the Eskimo and Aleut peoples. Aleut is a single language with two surviving dialects. Eskimo consists of two divisions: Yupik, spoken in Siberia and south-western Alaska, and Inuit, spoken in northern Alaska, Canada, and Greenland. Each division includes several dialects.

A brief treatment of the Eskimo-Aleut languages follows. For full treatment, see MACROPAEDIA: Languages of the World: *Eskimo-Aleut languages*.

Eskimo and Aleut are related but quite distinct languages; they have no known outside relatives. Aleut, now greatly reduced in number of speakers, is the smallest branch of the family. It was formerly a neighbouring language to Eskimo on the Alaska Peninsula. It is now spoken in the Aleutian Islands and in the Pribilof Islands in the Bering Sea, settled by Aleuts from 1800 on.

Eskimo and Aleut have relatively simple sound systems. Yupik has four distinct vowels, while Inuit and Aleut have only three. Of the consonants, Eskimo has from 13 to 27, depending on the dialect.

Eskimo is a highly inflected language and has a great number of suffixes but only one prefix and no compounds. In Aleut the word forms are simpler, but the syntactic constructions are more numerous. Suffixes are often accompanied by changes in the stem.

A remarkable feature of the vocabulary is the great number of demonstratives, about 30 in western Eskimo and in Aleut. The possibility of derivation in Eskimo-Aleut is virtually unlimited, and the number of word stems is comparatively small.

Eskimo dog, breed of sled and hunting dog found near the Arctic Circle. It is believed by some authorities to be representative of a pure breed 25,000 to 50,000 years old and by others to be descended from wolves. The Eskimo dog is powerfully built and big-boned. Its long, waterproof outer coat, variable in colour, covers a thick, woolly undercoat. The Eskimo dog stands about 51 to 64 cm (20 to 25 inches)

high and usually weighs between 30 and 39 kg (65 and 85 pounds).

Eskişehir, city, west-central Turkey. It lies along the Porsuk River, a tributary of the Sakarya River, at a point about 125 miles (200 km) west of Ankara. Lying near the site of the ancient Phrygian city of Dorylaeum, the present city probably began in Byzantine times as a cluster of settlements around hot springs. The scene of a crusader victory over the Seljuq Turks in 1097, it came under Ottoman control near the end of the 13th century. The city expanded with the coming of the railway in the late 19th century and the immigration of Turks from the European provinces of the Ottoman Empire in the early 20th century. Despite its name (Turkish: "Old City"), most of the city was rebuilt after its destruction in the Turkish War of Independence (1919–22).

Eskişehir is divided into a commercial and industrial section, situated on low ground, and a residential quarter that occupies higher ground. One of the largest industrial centres in Turkey, it produces sugar, textiles, bricks, cement, chemicals, processed merschaum, and railway and agricultural equipment. It also has aircraft workshops and is a centre for cotton research. It is a rail junction on the Istanbul-Ankara and Istanbul-Baghdad lines. Eskişehir is the seat of the University of Anatolia (1958). Pop. (1997) 454,536.

Esmā'il I (shah of Iran): *see* Ismā'il I.

Esmā'il I ibn Aḥmad (Sāmānid ruler): *see* Ismā'il I ibn Aḥmad.

Esmeraldas, city, major seaport of north-western Ecuador. It lies on the Pacific coast at the mouth of the Esmeraldas River. The city is the chief trading centre for the region's agricultural and lumbering resources but is only slightly developed industrially. It is the terminus of the 313-mile (504-kilometre) Trans-Ecuadorian Pipeline from the oil fields in northeastern Ecuador. An oil refinery was completed in 1977, and new oil port facilities at Esmeraldas were opened in 1979. Important exports are bananas and timber. Tourism has been stimulated by nearby seaside resort facilities, an equable climate, and a good all-weather highway to Quito. A technical university was established in Esmeraldas in 1970. Pop. (1997 est.) 117,722.

esophageal cancer, abnormal growth of cells in the esophagus, the muscular tube connecting the oral cavity with the stomach. Worldwide, men are more than twice as likely to develop esophageal cancer as women. In the United States, blacks are three times more likely than whites to develop the disease.

Several risk factors have been identified that increase the likelihood of developing esophageal cancer. Some factors, such as age, sex, and race, are impossible to control. However, tobacco and alcohol use increase risk, and these behaviours can be controlled. Long-term problems with acid reflux may lead to a condition called Barrett's esophagus, in which

the normal squamous cells that line the esophagus are replaced with glandular cells; this condition increases cancer risk.

Esophageal cancers are usually diagnosed once symptoms have appeared, but by this time the cancer has usually developed to a relatively advanced stage. Symptoms may include difficulty or pain when swallowing, pain or tightness in the chest, unexplained weight loss, hoarseness, or frequent hiccups.

If cancer is suspected, the esophagus is visually examined with an endoscope, and tissue samples are taken for biopsy. Several imaging methods are frequently used, such as X rays, computed tomography (CT) scans, or ultrasound.

The survival rate for esophageal cancer is lower than for many other cancers. When the cancer is detected before it has invaded the underlying tissue layers of the esophagus, the five-year survival rate is high, but fewer than 25 percent of esophageal cancers are diagnosed at this stage. If the cancer has moved to the tissue immediately underlying the mucosal surface, five-year survival is reduced to about 50 percent, and the rate drops significantly once the cancer has moved from the esophagus to nearby lymph nodes or other tissues. Once the cancer has spread to distant tissues in the body, five-year survival is extremely low.

Esophageal cancers are best treated surgically when possible. If the cancer is confined to the upper region of the esophagus, an esophagectomy may be done to remove the cancerous portion, along with nearby lymph nodes, and to reconnect the remaining esophagus to the stomach. For cancers of the lower esophagus, it may be necessary to perform an esophagogastrectomy, in which a portion of the esophagus is removed along with a portion of the stomach. The stomach is then reattached directly to the remaining esophagus, or a segment of the colon is used to link the stomach and esophagus. Both of these surgeries often result in serious complications. Other less-drastring surgical procedures may be used to relieve symptoms, especially when surgical cure is not possible. Radiation therapy and chemotherapy may be used in conjunction with surgery to destroy cancer cells or to relieve symptoms.

Esophageal cancer cannot be completely prevented, but risk can be lowered by reducing alcohol consumption and avoiding tobacco. Individuals who are at high risk should receive regular screening in order to increase the probability of early detection.

esophagus, also spelled OESOPHAGUS, relatively straight muscular tube through which food passes from the pharynx to the stomach. The esophagus can contract or expand to allow for the passage of food. Anatomically it lies behind the trachea and heart and in front of the spinal column; it passes through the muscular chest diaphragm before entering the stomach. Both ends of the esophagus are closed off by muscular constrictions known as sphincters; at the anterior, or upper, end is the upper esophageal sphincter, and at the distal, or lower, end is the lower esophageal sphincter.

For a depiction of the esophagus in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-vision in the PROPAEDIA: Part Four, Section 421.

The upper esophageal sphincter is composed of circular muscle tissue and remains closed most of the time. Food entering the pharynx relaxes this sphincter and passes through it into the esophagus; the sphincter immediately closes to prevent food from backing up. Contractions of the muscles in the esophageal

wall (*see* peristalsis) move the food down the esophageal tube. The food is pushed ahead of the peristaltic wave until it reaches the lower esophageal sphincter, which opens, allowing food to pass into the stomach, and then closes to prevent the stomach's gastric juices from entering the esophagus.

Esophagus

Some animals, such as dogs and certain ruminants (cud-chewing animals), can bring the contents of their stomach back through the esophagus by reverse peristaltic movements. It is doubtful that humans have this ability. A bird's esophagus depends mainly on gravity for liquid and food propulsion; the bird must elevate its head to start the food's descent. The esophagus is a short, ill-defined area of alimentary tract of some fish and is elongated in land vertebrates.

Disorders of the esophagus include ulceration and bleeding; heartburn, from gastric juices in the esophagus; achalasia, an inability to swallow or to pass food from the esophagus to the stomach, caused by destruction of the nerve endings in the walls of the esophagus; scleroderma, a collagen disease involving the esophagus; and spasms of the esophageal muscles. For information on esophageal speech, *see* pseudolaryngeal speech.

Esox, fish genus that includes the popular game fishes known as pike, pickerel, and muskellunge (*qq.v.*).

ESP: *see* extrasensory perception.

espalier, tree or other plant that is trained to grow flat against a support (such as a trellis or wall). The term also denotes the trellis or other support on which such trees or plants are trained, as well as the method or technique itself. Espalier was developed in Europe to encourage fruit-tree production in an incompatible climate, and the technique originally employed a wall to provide necessary heat as well as support.

Decorative or space-saving espaliers use metal, wire, or wooden frames to create ornamental shapes for shrubbery or to train tree-growth on trellises, on stone, brick, or glass walls, or on fences. One method requires tip-pruning after the desired growth is reached, with auxiliary branches tied to a horizontal frame slightly above ground level. Evergreens such as loquat, fire thorn, sweet bay magnolia, and upright yew, as well as dwarf apple and pear trees, make excellent espaliers.

España: *see* Spain.

Española Island, also called HOOD ISLAND, southernmost of the major Galápagos Islands, in the eastern Pacific Ocean, about 600 miles (965 km) west of Ecuador. Large seal and albatross colonies live on the island, which has an area of 18 square miles (47 square km), but there are no human settlements.

Espartero, Baldomero, PRINCE (príncipe) DE VERGARA, also called (from 1839) DUKE (duque) DE LA VICTORIA, or (from 1837) COUNT (conde) DE LUCHANA, byname THE PEACEMAKER OF SPAIN, Spanish EL PACIFICADOR DE ESPAÑA (b. Oct. 27, 1793, Granátula, Spain—d. Jan. 8, 1879, Logroño), Spanish general and statesman, victor in the First Carlist War, and regent.

The son of working-class parents, Espartero entered the army at age 15 and fought with Spanish forces in the French Revolutionary and Napoleonic wars and in the rebellious Americas. On the death of Ferdinand VII he showed himself a strong supporter of the queen regent María Cristina and enthusiastically joined the forces opposed to Don Carlos (Carlos María Isidro de Borbón). He was made commander in chief and, for his victory over the Carlists at the Battle of Luchana (December 1836), was created Count de Luchana. Later he opened up the negotiations that led to the Convention of Vergara (1839) and ended the civil war. This success earned Espartero the popular sobriquet "the Peacemaker of Spain" and the title Duke de la Victoria. He had begun to dabble in politics in 1836; on his return to Madrid (1840) he became head of the government and selected a cabinet of ministers who agreed with his progressive ideas. María Cristina preferred to resign the regency (October 1840) rather than accept his program of reforms. Espartero was then himself appointed regent by the Cortes (May 1841), or Spanish parliament.

Espartero's regency revealed his faulty understanding of politics. The progressive party was not united, and when Agustín Argüelles was appointed tutor to young Isabella II by the Cortes, María Cristina's protests from Paris gained the support of the moderates. Generals Concha and Diego de León attempted to seize Isabella in September 1841, and the severity with which Espartero crushed their rebellion made his government unpopular. A republican revolt in 1842 was put down with equal harshness. In 1843 Generals Ramón Narváez and Francisco Serrano rose against Espartero and obliged him to flee to England, where he lived until 1849, when he returned to Spain and lived in retirement at Logroño.

Espartero made his reappearance in politics in 1854 to share control of the government with General Leopoldo O'Donnell during the so-called *bienio progresista*. He finally retired in 1856 and did not even intervene when Isabella II was dethroned (1868). Subsequently (1875) he was awarded the title Prince de Vergara, together with the style of royal highness, by King Amadeus.

esparto, also called ESPARTO GRASS, SPANISH GRASS, HALFA, or ALFA, either of two species of gray-green needlegrasses (*Stipa tenacissima* and *Lygeum spartum*) that are indigenous to southern Spain and northern Africa; the term also denotes the fibre produced by esparto.

L. spartum, which has stiff, rushlike leaves, grows in rocky soil on the high plains. *S. tenacissima* is especially abundant in the sterile and rugged parts of Murcia and Valencia and in Algeria, for it flourishes in sandy, ferruginous soils, in dry, sunny situations on the seacoast. It attains a height of 1 or 1.2 m (3 or 4 feet). The stems are cylindrical and grow in clusters of from 0.6 to 3 m in circumference; when young they serve as forage, but after a few years they acquire great toughness. Esparto fibre has great strength and flexibility, and the grass has for centuries been used for making ropes, sandals, baskets, mats and other durable articles. Esparto leaves are also used in the manufacture of paper.

Esperanto, artificial language constructed in 1887 by L.L. Zamenhof, a Polish oculist, and intended for use as an international second language. Zamenhof's *Fundamento de Esperanto*, published in 1905, lays down the

basic principles of the language's structure and formation.

Esperanto is relatively simple for Europeans to learn because its words are derived from roots commonly found in the European languages, particularly in the Romance languages. Orthography is phonetic, all words being spelled as pronounced. Grammar is simple and regular; there are characteristic word endings for nouns, adjectives, and verbs. Nouns have no gender and are marked by the ending *-o*; the plural is indicated by *-oj* (pronounced *-oy*), and the objective (accusative) case by *-on*, plural *ojn*: *amiko* "friend," *amikoj* "friends," *amikon* "friend (accusative)," *amikojn* "friends (accusative)." There is only one definite article, *la* (e.g., *la amiko* "the friend"), and no indefinite article. Adjectives end in *-a* (e.g., *bona amiko* "good friend") and take plural and objective endings to agree with nouns (e.g., *la bonaj amikoj estas tie* "the good friends are there," *mi havas bonajn amikojn* "I have good friends"). Verbs are all regular and have only one form for each tense or mood; they are not inflected for person or number (*mi havas, vi havas, ŝi havas, ili havas* "I have, you have, she has, they have"). There is an extensive set of suffixes that can be added to word roots to allow various shades of meaning or newly derived forms; compound words are also used.

Esperanto is probably the most successful of the artificial international languages. The number of Esperanto speakers is estimated at more than 100,000. The Universala Esperanto-Asocio (founded 1908) has members in 83 countries, and there are 50 national Esperanto associations and 22 international professional associations that use Esperanto. There is an annual World Esperanto Congress, and more than 100 periodicals are published in the language. More than 30,000 books have been published in Esperanto.

Espinel, Vicente, in full VICENTE MARTÍNEZ ESPINEL (baptized Dec. 28, 1550, Ronda, Málaga, Spain—d. Feb. 4, 1624, Madrid), Spanish writer and musician remembered chiefly for his picaresque novel *La vida del Escudero Marcos de Obregón* (1618; "Life of Squire Marcos of Obregón"), upon which the French novelist Alain-René Lesage based parts of his *Histoire de Gil Blas de Santillane* (1715–35; *The History of Gil Blas of Santillane*).

After his expulsion from the University of Salamanca in 1572, Espinel entered the army and led a roguish life very much like that of his character Marcos, visiting Italy, Flanders, and the Netherlands. He returned to Spain in 1584 and was ordained to the priesthood in 1587. Espinel revived the *décima*, an octosyllabic 10-line stanza that became widely used in Spanish verse in a form known as the *espinela*. Espinel was also once mistakenly thought to have added the fifth string to the Spanish guitar.

Espinhaço Mountains, Portuguese SERRA DO ESPINHAÇO, mountain range of Minas Gerais and Bahia states, eastern Brazil. Their summit stands between 3,600 and 6,500 feet (1,100 and 2,000 m) and forms the divide between the tributaries of the São Francisco River and the streams that descend directly to the Atlantic on the east. Since the early 18th century the Espinhaço Mountains have been mined for gold, diamonds, and semiprecious stones, but they are now economically important chiefly for their vast store of high-grade iron ore and manganese. The mountains are also the world's chief source of quartz crystals.

Espinosa, Pedro de (b. 1578, Antequera, Spain—d. Oct. 21, 1650, Sanlúcar de Barrameda), Spanish poet and editor of the anthology *Flores de poetas ilustres de España* (1605; "Flowers from the Illustrious Poets of Spain"), in which most of the important poets of Spain's Siglo de Oro (Golden Age; c. 1500–

1650) were published. The anthology choices of authors and poems reflect the continuing judgment of later times.

Espinosa's own poetry clearly showed the Baroque influences of highly ornamental language and subtlety bordering on the esoteric. His long poem *Fábula del Genil* is considered one of the better poems in the Baroque mode, enlivening as it does conventional themes such as love of nature and classical mythology.

espionage, process of obtaining military, political, commercial, or other secret information by means of spies, secret agents, or illegal monitoring devices. Espionage is sometimes distinguished from the broader category of intelligence gathering by its aggressive nature and its illegality. *See* intelligence.

espionage, industrial: *see* industrial espionage.

Espirito Santo, *estado* (state) on the east coast of Brazil. It is bounded on the north by the state of Bahia, on the east by the Atlantic Ocean, on the south by the state of Rio de Janeiro, and on the north and west by the state of Minas Gerais. It has a total area of 17,605 sq mi (45,597 sq km), including the uninhabited offshore islands of Trindade and Martin Vaz. Vitória, the port and capital city, stands on an island in the Baía do Espírito Santo (Bay of Espírito Santo), the only bay on the coast.

Esprito Santo formed part of one of the captaincies given by the Portuguese crown to the explorer Vasco Fernandes Coutinho, who, on May 23, 1535, first landed on the future site of Vitória. In 1799 Espírito Santo became an independent captaincy, in 1824 a province of the Brazilian Empire, and in 1889 a state of the newly formed federal republic.

The relief is characterized by the low mountain ranges of the Serra dos Aморés on the western border and by isolated groups of hills on the eastern coastal plains. The most important rivers—the Doce, São Mateus, and Itapemirim—flow eastward across the state to the ocean; navigation on these rivers is hampered by their irregular rate of flow, as well as by falls, rapids, and sandbars.

The state is today sparsely forested, as most of the forests that formerly supplied Brazil with a substantial proportion of its exports of rosewood and other cabinet woods have now been destroyed.

With the exception of the sandy plains and swamps of the coastal strip, the soil is generally fertile. Repeated plantings of the same crops have, however, exhausted some soils, and many fields have been converted to pasture land. The climate of the coastal zone and the valleys is hot and humid. In the highlands the temperature is lower, and the climate more comfortable. Rainfall, which averages about 50 in. (1,270 mm) a year, is heavier from October to March.

The population is predominantly white, but blacks, mulattoes, and caboclos (of mixed European and Indian ancestry) are also found in high proportions. The population is unevenly distributed. The largest and most populous cities and towns are Vitória, Itaquari, Cachoeiro de Itapemirim, Colatina, and Vila Velha. The overwhelming majority of the population are Roman Catholic, although Protestants of all denominations and Spiritualists are also represented. Portuguese is the mother tongue of almost the entire population.

Campaigns against infectious diseases have been successfully pursued. Yellow fever and smallpox have been eliminated, and malaria has been virtually eradicated. The inroads of tuberculosis have also been greatly reduced. Between 1950 and the late 20th century the death rate dropped sharply.

Primary education is administered by the state but is largely subsidized by the federal government. In the late 20th century the

state embarked on an extensive school-building program, as well as on a vigorous literacy campaign. Secondary schools are distributed throughout the state; there are two medical schools in Vitória.

Agriculture remains the leading economic activity; coffee, cacao, sugarcane, rice, and corn (maize) are the principal products. Cattle raising is important, with beef cattle generally being raised in the north and dairy cattle in the south. Poultry farming is becoming increasingly important, as is industry, especially food processing. Espírito Santo has two railways—one connecting Vitória with Rio de Janeiro to the southwest and one that moves iron ore from the mines of Minas Gerais for export through the port of Tubarão near Vitória. The state is crisscrossed by an extensive road network, and Vitória airport is capable of handling small jet aircraft.

There are several radio stations and television stations in the state; Vitória has many cultural institutions. Local festivals usually are of a religious nature, and local folklore is deeply rooted in Portuguese and African traditions. Pop. (1996) 2,793,100.

Espirito Santo (city, Brazil): *see* Vila Velha.

Espirito Santo, also called **SANTO**, formerly **MARINA**, largest (1,420 sq mi [3,677 sq km]) and westernmost island of Vanuatu, in the

Coconut plantation near Luganville, Espiritu Santo Island, Vanuatu
Shostal—EB Inc

southwestern Pacific Ocean. Volcanic in origin, it has a mountain range running along its west coast; Mt. Tabwemasana rises to 6,165 ft (1,879 m). It is heavily wooded and has broad, fertile, well-watered valleys. The island was sighted in 1606 by the Portuguese navigator Pedro Fernández de Quirós, who built a short-lived settlement at the head of St. Philip and St. James Bay.

Hog Harbour, on the northeast coast, is the site of the former British district administration. The former French headquarters is on the south coast at Segond, near which lies Luganville (Santo), second largest town of Vanuatu, with a deepwater port and an international airport. Luganville was an important U.S. Army base during World War II. Exports include copra, coffee, cacao, canned meat, and tuna. Pop. (1989) 18,958.

Espoo, Swedish **ESBO**, town, Uudenmaan lääni (Uusimaa province), southern Finland, just west of Helsinki, in a region of broad, flat valleys covered with low clay hills. It is located in an area that has been inhabited since 3500 bc. Granite quarrying is a local industry. The town has railway connections to Helsinki and the remainder of Finland. Notable buildings include a church dating from 1458 and the castle-like studio of the artist Akseli Gallen-Kallela, constructed in 1911–13 and now the Tarvaspää Museum. Espoo is also the location of the Helsinki University of Technology (1908). Pop. (2000 est.) mun., 209,667.

Esposito, Phil, byname of **PHILIP ANTHONY ESPOSITO** (b. Feb. 20, 1942, Sault Ste. Marie, Ont., Can.), Canadian-born U.S. professional ice hockey centre (1963–81) in the National

Hockey League (NHL), who was a leading scorer in his day.

Esposito played hockey from his youth onward, and after a season (1962–63) on a Chicago Black Hawk farm team played as a regular on the parent team from the next season, becoming a regular in the 1964–65 season. He was traded in 1967 to the Boston Bruins and in 1975 to the New York Rangers, retiring in 1981. He was the first hockey player to score more than 100 points (goals plus assists) in a season (1968–69). In the 1968–69 season he scored a record-setting 49 goals and 77 assists (126 points) and increased the record in the 1970–71 season to 152 points, a record that stood until the 1981–82 season, when it was broken by the Edmonton Oilers' Wayne Gretzky. Esposito's 1,282 games played was second only to Gordie Howe's total. He won the NHL Art Ross Trophy as top scorer of the league five times (1969, 1971–74). After retiring as a player, he was an announcer and did television commentary for Ranger games. His brother Tony was a goalie for the Chicago Black Hawks.

Espos y Mina, Francisco (b. June 17, 1781, Idocin, Spain—d. Dec. 13, 1836, Barcelona), outstanding guerrilla leader during the Peninsular War, or Spanish War of Independence (1808–14), against the French; he later embraced the Liberal cause and played a role in various uprisings and in the First Carlist War (1833–39).

Espos y Mina farmed a small family inheritance until 1808, when he joined the struggle against the French invaders. A skilled organizer and strategist, by 1810 he had become the leader of the guerrillas of Navarre, a northern province. In 1813–14 he served with distinction under the Duke of Wellington, the British commander.

After the absolutist Bourbon king Ferdinand VII was restored in 1814, Espos y Mina led an unsuccessful Liberal coup at Pamplona and fled to France. After the successful revolution against Ferdinand in 1820, he returned and in 1823 led the Liberal army in Catalonia against the French, who had intervened to restore Ferdinand. Defeated, he escaped to England but returned again in 1830 for another abortive uprising. In 1834 after Ferdinand's death, Espos y Mina took the field with mixed success in engagements with the Carlists, supporters of Ferdinand's brother Don Carlos.

Espronceda y Delgado, José de (b. March 25, 1808, Almendralejo, Spain—d. May 23, 1842, Madrid), Romantic poet and revolutionary, often called the Spanish Lord Byron.

He fled Spain in 1826 for revolutionary activities and in London began a tempestuous affair with Teresa Mancha (the subject of *Canto a Teresa*) which dominated the next 10 years of his life. He participated in the July Revolution of France (1830) and was later allowed to return to Spain, where he was a founder-member of the Republican Party and was imprisoned several times for revolutionary activities. His historical novel *Sancho Saldaña* (1834), influenced by Sir Walter Scott, was written in prison in Badajoz. *El estudiante de Salamanca* (1839; "The Student of Salamanca"), a milestone of Iberian Romanticism, is a variant of the Don Juan legend that carries to extremes the antisocial and antireligious attitudes of its protagonist. Espronceda was most admired for his lyric poetry, and his *Poesias* (1840; "Poems") shows the influence of both Lord Byron and Scott. The unfinished poem *El diablo mundo* ("The Devilish World") contains ideological reflections and is considered one of his best works. Espronceda served as secretary of the diplomatic legation to The Hague (1840) and deputy to the Cortes from Almería (1842). He also wrote several plays—

Blanca de Borbón (1870), *Ni el tío ni el sobrino* (1834; "Neither the Uncle nor the Nephew"), and *Amor venga sus agravios* (1838; "Love Avenges Its Affronts").

Espy, James Pollard (b. May 9, 1785, Pennsylvania, U.S.—d. Jan. 24, 1860, Cincinnati, Ohio), American meteorologist who apparently gave the first essentially correct explanation of the thermodynamics of cloud formation and growth. He was also one of the first to use the telegraph for collecting meteorological observations.

Espy served as a meteorologist with the U.S. War Department and the U.S. Navy until 1852, when he continued his work at the Smithsonian Institution, Washington, D.C. He presented his theory of clouds and his more general (though incorrect) theory of storms before scientific audiences in the United States and Europe and in his *Philosophy of Storms* (1841).

Esquimalt, district municipality and western suburb of metropolitan Victoria, southwestern British Columbia, Canada, at the southeastern end of Vancouver Island, on Juan de Fuca Strait. The name means "place of gradually shoaling waters" in the local Indian language. Its harbour was visited (1790) by Manuel Quimper of the Spanish navy, who called it Puerto de Cordova to honour the Mexican viceroy. The community originated during the Crimean War (1853–56) as a naval base for a combined British-French fleet, which attacked the Russian northern Pacific port of Petropavlovsk on the Kamchatka Peninsula of Siberia. The British-owned installations were transferred to the Royal Canadian Navy in 1910. Esquimalt is the site of one of the world's largest dry docks and is now the headquarters of the Canadian Maritime Forces Pacific. Inc. 1912. Pop. (1991) 16,192.

Esquipulas, town, southeastern Guatemala, in the central highlands near the borders of Honduras and El Salvador at an elevation of 3,018 feet (920 m). The town itself is not large; it derives its great importance from its magnificent colonial church, now Central America's greatest pilgrimage centre, built in 1737 by the archbishop of Guatemala to house the spectacular Black Christ. The figure, commissioned by Spanish conquistadors and first placed in a local church in 1595, was carved out of dark wood in 1594. It is now dressed in white satin and adorned with jewels. Major religious processions occur on January 15 and during Holy Week. Esquipulas is 80 miles (130 km) east of Guatemala City and is accessible by highway and by air. Pop. (1993 est.) 10,095.

esquire, originally, a knight's shield bearer, who would probably himself in due course be dubbed a knight; the word is derived from the Old French *esquier* and earlier from the Latin *scutarius*.

In England in the later Middle Ages, the term *esquire* (*armiger*) was used to denote holders of knights' estates who had not taken up their knighthood, and from this practice it became usual to entitle the principal landowner in a parish "the squire." In Britain, the title *esquire*—properly held only by the eldest sons of younger sons of peers, by the eldest sons of baronets and knights, and by certain officials (including justices of the peace, mayors, sheriffs, and senior service officers)—is by courtesy extended to all professional men and is used, abbreviated as *Esq.*, as a form of address appended to surnames in place of the title Dr. or Mr.

Esquire, American monthly magazine, founded in 1933 by Arnold Gingrich. It began production as an oversized magazine for men that featured a slick, sophisticated style

and drawings of scantily clad young women. It later abandoned its titillating role but continued to cultivate the image of affluence and refined taste.

Esquire's early notoriety became the subject of a celebrated court case. In 1943 Frank C. Walker, the U.S. postmaster general, attempted to withdraw the magazine's second-class mailing privileges (an economic rate generally considered essential to a magazine's survival) on the grounds that *Esquire* was "not devoted to useful information" worthy of the mail subsidy. Gingrich and his associates protested, enlisting noted writers in their defense; he brought suit against Walker and in 1946 won his case in the U.S. Supreme Court.

Esquire was a pioneer in the use of unconventional topics and feature stories. As it began to publish the work of Thomas Wolfe, Ernest Hemingway, William Faulkner, John Steinbeck, Truman Capote, and Norman Mailer, the magazine's risqué image and its once racy air gradually receded. It provided an outlet for new writers of fiction and nonfiction, and its topical features, satiric humour, and excellent book, cinema, and music reviews filled a void between literary and opinion periodicals in the American market. Although the magazine continued to emphasize clothing and advertising directed to men, *Esquire* evolved into more of a general-audience publication.

Esquirol, Jean-Étienne-Dominique (b. Feb. 3, 1772, Toulouse, France—d. Dec. 12, 1840, Paris), early French psychiatrist who was the first to combine precise clinical descriptions with the statistical analysis of mental illnesses.

A student of Philippe Pinel, Esquirol succeeded his distinguished teacher as physician in chief at the Salpêtrière Hospital in Paris in 1811, further developing Pinel's diagnostic techniques and continuing his efforts to achieve more humane treatment of the mentally ill. Esquirol provided the first accurate description of mental retardation as an entity separate from insanity, and he also coined the term hallucination. His *Des maladies mentales, considérées sous les rapports médical, hygiénique, et médico-légal* (1838) has been called the first modern treatise on clinical psychiatry, and it remained a basic text for 50 years. Esquirol anticipated modern views in his suggestion that some mental illnesses may be caused by emotional disturbances rather than by organic brain damage.

ESR: see electron paramagnetic resonance.

Eşref DYNASTY, also spelled *ASHRAF*, Turkmen dynasty (c. 1290–c. 1326) that ruled in Beyşehir, west of Konya in central Anatolia.

The dynasty traced its origins to a Turkmen tribe that was settled by the Seljuqs of Anatolia on the western frontier. The family's founder, Eşref oğlu Sayfeddin Süleyman I, was a Seljuq emir who played an important role in Seljuq dynastic struggles during the reign (1283–98) of the Seljuq sultan Mas'ud II. Süleyman was appointed regent to the sons of the deposed Seljuq sultan, Ghiyâth ad-Din Kay-Khusraw, by Mas'ud's opponents in 1285, but he submitted to Mas'ud when the sultan consolidated his power. Later Süleyman I assisted Mas'ud against the latter's brother Siyâwush.

Süleyman's son Mehmed captured Akşehir and Bolvadin and in 1314 accepted Il-Khanid (western Mongol) suzerainty. He was succeeded by his son Süleyman II, whose reign coincided with an attempt by Demirtaş, the Il-Khanid governor of Anatolia, to assert his authority over the independent Turkmen rulers in Anatolia. About 1326 Demirtaş marched to Beyşehir and killed Süleyman II, putting an end to the Eşref principality. Later its territories were divided between the Karaman and Hamid principalities.

esrog (Jewish ceremonial object): see *etrog*.

Essad Paşa (Toptani) (b. c. 1864, Tirane, Albania—d. June 13, 1920, Paris, France), political leader who played a prominent but often disruptive role in Albania's affairs during the early years of the 20th century.

Essad was the scion of a rich Albanian family. He joined the Young Turk movement in 1908 and became deputy for Albania in the new Turkish parliament. The most powerful of the central native lords, he was given command of the Turkish forces at Shkodër (Scutari) during the First Balkan War, but he traitorously delivered the town to the Montenegrins (1913). He was then appointed minister of interior and of war in the first sovereign government of Albania under Prince William of Wied, where he intrigued against the government with an eye to becoming ruler himself. Though Essad was forced to leave the country when his plans were discovered (May 1914), his unsettling influence precipitated the eventual fall of Prince William in September. During World War I Essad won the recognition of French authorities at Salonika as head of an Albanian government-in-exile. He was assassinated in Paris by Avni Rustem, an Albanian student.

Essaouira, formerly *MOGADOR*, Atlantic port city, western Morocco, midway between Safi and Agadir. The site was occupied by Phoenicians and then Carthaginians and was mentioned in the chronicles of the Carthaginian explorer Hanno (5th century BC). Medieval charts show it as Mogador, a corruption of a Berber word for "safe anchorage." It stands

Quayside scene at Essaouira, Morocco
Syndication International Ltd., London

on a peninsula 10–20 feet (3–7 m) above sea level and at times with heavy tides is almost an island. Its harbour is sheltered by offshore islets and a rocky headland, but the channel is narrow and dangerous.

Founded by Sultan Sidî Muḥammad ibn 'Abdullāh in 1765 as a rival port to Agadir, it was planned by a French captive, Théodore Cornut, and fortified in the style of the French military engineer Sébastien Le Prestre de Vauban. A colony of Moroccan Jews was installed to extend commerce.

On the land side stretch miles of sand dunes studded with broom, and beyond are forests of argan (Morocco ironwood) unique to the country. A temperate climate and fine beaches have made it a bathing resort. Essaouira is known for its artisan industries, notably inlaid cabinetwork. It is connected by road with Safi, Marrakech, and Agadir. Pop. (1982) 42,035.

Essarhaddon (Assyrian king): see *Esharhad-don*.

essay, a literary composition of moderate length, dealing in an easy, cursory way with a single subject, usually representing the writer's personal experience and outlook. The form was invented in the late 16th century by the French writer Michel de Montaigne, who chose the name *essai* to emphasize that his compositions were attempts or endeavours, feeling their way toward the expression of his personal thoughts and experiences. The reflective Montaigne wrote about himself with startling frankness, capturing his fancies about the intimate things of life with superb skill

and setting them down in a vivid and arresting way. His *Essays*, published in their final form in 1588, are still considered among the finest of their kind.

Francis Bacon was the first great English essayist, although his *Essays* (1597; enlarged editions in 1612 and 1625) are utterly different from those of Montaigne. The topics were grave and weighty—"Of Ambition," "Of Truth," "Of Great Place," and the like—and the style is lofty and often austere. Abraham Cowley (1618–67) was the first English writer of distinction to follow Montaigne's example, echoing the Frenchman's personal touch in such essays as "Of Myself." In the 18th century the English essay enjoyed a great vogue, taking shape in the hands of such masters as Addison and Steele, Samuel Johnson, and Oliver Goldsmith.

Among the greatest of the English essayists was Charles Lamb (1775–1834), whose "Essays of Elia," which began to appear in 1820, are universally recognized as landmarks of the genre. Lamb's essays combine humour, fantasy, and sentiment with a gift for perceptive observation of life, all expressed in a highly personal style. Another outstanding essay writer was Thomas De Quincey (1785–1859), whose works include such highly polished and imaginative pieces as "On Murder as One of the Fine Arts" and "On the English Mail Coach." In the latter half of the 19th century, the essays of Robert Louis Stevenson are of the same class as those of Montaigne and Lamb, and he approached far more closely than his contemporaries to their level of excellence.

In the United States the essay had been written with genius by Thoreau in *Walden*, and Emerson's *Essays*, though not in the tradition of Montaigne and Lamb, were rich in lofty thought and utterance.

Although invented by a great French writer, the essay was very late in making itself at home in France. The admirable *Causeries du lundi* of Saint-Beuve (1804–69) are literary essays in the fullness of the term and have been the forerunners of much brilliant essay writing in France. Other French essayists of special distinction are Théophile Gautier and Anatole France. All these were writers of literary essays, and it is in the analysis of manifestations of intellectual energy that the essay has been best illustrated in France.

During the 20th century the essay was reborn as a playful kind of literature, and such humorists as James Thurber and Dorothy Parker excelled in the art.

Esseg (Croatia): see Osijek.

Essen, city, North Rhine-Westphalia Land (state), western Germany, between the Rhine-Herne Canal and the Ruhr River. It was origi-

Villa Hügel, former home of the Krupp family in Essen, Ger.

nally the seat of an aristocratic convent (founded 852), still represented by the cathedral (the seat of a Roman Catholic bishop), completed in the 15th century. In the suburb of Werden, the abbey church was founded in 796 as part of a monastery. The convent and the abbey exercised local sovereignty as imperial

states until their dissolution in 1802, when Essen passed to Prussia.

The development of ironworks, steelworks, and coal mines during the 19th century stimulated rapid growth from a small town (about 3,000 inhabitants in 1802) to the largest industrial city in the Ruhr coalfield. It was occupied by the French (1923–25) and suffered heavy destruction in World War II as a centre of German war industry. The city has since been rebuilt with large, modern administrative and office buildings and housing, concert halls, an economic research institute, and the Museum Folkwang featuring 19th- and 20th-century art. The Ruhr is dammed there to form the Baldeney Lake, near which is the Villa Hügel, originally the home of the Krupps (the noted German industrialists) and since 1953 used for meetings and cultural events.

The industrial hub of the Ruhr, Essen is also a retail trade centre and a rail junction. Apart from coal and steel, it has diversified heavy, medium, and light industries, including construction, chemical and glassworks, and factories for textiles and precision instruments. The coal mines and most of the city's industry are concentrated to the north toward the canal, while the southern part of Essen presents a landscape of woods and parks. Pop. (1990 est.) 624,445.

Essen, Louis (b. Sept. 6, 1908, Nottingham, Nottinghamshire, Eng.—d. Aug. 24, 1997, Great Bookham, Surrey), English inventor of the Essen quartz ring clock widely used as a time standard in observatories, and builder of the atomic clock (cesium standard).

In 1929 Essen began work on frequency and time standards at England's National Physical Laboratory, Teddington, Middlesex, making studies of tuning forks and quartz oscillators; his investigations culminated in the quartz ring clock (1938). During World War II he invented a number of radio-wave measuring devices that led him in 1950 to measure the speed of light as $299,792.5 \pm 1$ km/sec. Later work resulted by 1958 in construction of the cesium atomic beam standard, accurate to 1 part in 10^{11} , and its adoption by Britain the following year as the national standard. Essen was elected a fellow of the Royal Society in 1960.

essence of rose (essential oil): see attar of roses.

Essene, member of a religious sect or brotherhood that flourished in Palestine from about the 2nd century BC to the end of the 1st century AD. The New Testament does not mention them and accounts given by Josephus, Philo of Alexandria, and Pliny the Elder sometimes differ in significant details, perhaps indicating a diversity that existed among the Essenes themselves.

The Essenes clustered in monastic communities that, generally at least, excluded women. Property was held in common and all details of daily life were regulated by officials. The Essenes were never numerous; Pliny fixed their number at some 4,000 in his day.

Like the Pharisees, the Essenes meticulously observed the Law of Moses, the sabbath, and ritual purity. They also professed belief in immortality and divine punishment for sin. But, unlike the Pharisees, the Essenes denied the resurrection of the body and refused to immerse themselves in public life. With few exceptions, they shunned Temple worship and were content to live ascetic lives of manual labour in seclusion. The sabbath was reserved for day-long prayer and meditation on the Torah (first five books of the Bible). Oaths were frowned upon, but once taken they could not be rescinded.

After a year's probation, proselytes received their Essenian emblems but could not participate in common meals for two more years. Those who qualified for membership were

called upon to swear piety to God, justice toward men, hatred of falsehood, love of truth, and faithful observance of all other tenets of the Essene sect. Thereafter new converts were allowed to take their noon and evening meals in silence with the others.

Following the discovery of the Dead Sea Scrolls (late 1940s and 1950s) in the vicinity of Khirbat Qumrān, most scholars have agreed that the Qumrān (*q.v.*) community was Essenian.

Consult the INDEX first

essential oil, highly volatile substance isolated by a physical process from an odoriferous plant of a single botanical species. The oil bears the name of the plant from which it is derived; for example, rose oil or peppermint oil. Such oils were called essential because they were thought to represent the very essence of odour and flavour.

Distillation is the most common method for isolation of essential oils, but other processes—including enfleurage (extraction by using fat), maceration, solvent extraction, and mechanical pressing—are used for certain products. Younger plants produce more oil than older ones, but old plants are richer in more resinous and darker oils because of the continuing evaporation of the lighter fractions of the oil.

Out of the vast number of plant species, essential oils have been well characterized and identified from only a few thousand plants. The oils are stored as microdroplets in glands of plants. After diffusing through the walls of the glands, the droplets spread over the surface of the plant before evaporating and filling the air with perfume. The most odoriferous plants are found in the tropics, where solar energy is greatest.

The function of the essential oil in a plant is not well understood. Odours of flowers probably aid in natural selection by acting as attractants for certain insects. Leaf oils, wood oils, and root oils may serve to protect against plant parasites or depredations by animals. Oleo-resinous exudations that appear when the trunk of a tree is injured prevent loss of sap and act as a protective seal against parasites and disease organisms. Few essential oils are involved in plant metabolism, and some investigators maintain that many of these materials are simply waste products of plant biosynthesis.

Commercially, essential oils are used in three primary ways: as odorants they are used in cosmetics, perfumes, soaps, detergents, and miscellaneous industrial products ranging from animal feeds to insecticides to paints; as flavours they are present in bakery goods, candies, confections, meat, pickles, soft drinks, and many other food products; and as pharmaceuticals they appear in dental products and a wide, but diminishing, group of medicines.

The first records of essential oils come from ancient India, Persia, and Egypt; and both Greece and Rome conducted extensive trade in odoriferous oils and ointments with the countries of the Orient. Most probably these products were extracts prepared by placing flowers, roots, and leaves in fatty oils. In most ancient cultures, odorous plants or their resinous products were used directly. Only with the coming of the golden age of Arab culture was a technique developed for the distillation of essential oils. The Arabs were the first to distill ethyl alcohol from fermented sugar, thus providing a new solvent for the extraction of essential oils in place of the fatty oils that had probably been used for several millennia.

The knowledge of distillation spread to Europe during the Middle Ages, and isolation of

essential oils by distillation was described during the 11th to 13th centuries. These distilled products became a specialty of the European medieval pharmacies, and by about 1500 the following products had been introduced: oils of cedarwood, calamus, costus, rose, rosemary, spike, incense, turpentine, sage, cinnamon, benzoin, and myrrh. The alchemical theories of the Swiss physician and alchemist Paracelsus played a role in stimulating physicians and pharmacists to seek essential oils from aromatic leaves, woods, and roots.

Starting from the time of Marco Polo, the much-prized spices of India, China, and the Indies served as the impetus for European trade with the Orient. Quite naturally, such spices as cardamom, sage, cinnamon, and nutmeg were subjected to the pharmacists' stills. By the middle of the 18th century in Europe about 100 essential oils had been introduced, although there was little understanding about the nature of the products. As chemical knowledge expanded in the late 1800s and early 1900s, many well-known chemists took part in the chemical characterization of essential oils. Improvement in knowledge of essential oils led to a sharp expansion in production, and use of the volatile oils in medicine became quite subordinate to uses in foodstuffs, beverages, and perfumes.

In the United States, oils of turpentine and peppermint were produced before 1800; within the next several decades oils of four indigenous American plants became important commercially—namely, sassafras, wormwood, wintergreen, and sweet birch. Since 1800 many essential oils have been prepared, but only a few have attained commercial significance.

Methods of production. The first step in the isolation of essential oils is crushing or grinding the plant material to reduce the particle size and to rupture some of the cell walls of oil-bearing glands. Steam distillation is by far the most common and important method of production, and extraction with cold fat (enfleurage) or hot fat (maceration) is chiefly of historical importance.

Three different methods of steam distillation are practiced. In the oldest and simplest method a vessel containing water and the chopped or crushed plant material is heated by a direct flame, and the water vapour and volatile oil are recovered by a water-cooled condenser. This original method is being replaced by a process in which the plant material is suspended on a grid above the water level, and steam from a second vessel is introduced under the grid. The volatiles are condensed and the oil is separated. In the third process, the vessel containing the plant material on a grid is heated to prevent condensation of steam, so that dry distillation is attained.

In southern France essential oils were extracted with cold fat long before the introduction of extraction with volatile solvents. This process is applied to flowers that do not yield an appreciable quantity of oil by steam distillation or whose odour is changed by contact with boiling water and steam. In this process, flowers are spread over a highly purified mixture of tallow and lard and are left for a period varying from 24 hours to 72 hours. During this time most of the flower oil is absorbed by the fat. The petals are then removed (defleurage), and the process is repeated until the fat is saturated with oil. The final product is called pomade (*e.g.*, pomade de jasmine).

In most cases, it is possible to shorten the long enfleurage process by extracting the essential oils using molten fat for one to two hours at a temperature ranging from about 45° to 80° C (110° to 175° F). The fat is filtered after each immersion, and after 10 to 20 extraction cycles the pomade is sold as such,

or it may be extracted with alcohol to yield the oil residue.

Since both enfleurage and maceration are rather expensive processes, some essential-oil specialists have shifted almost completely to using volatile solvents for the recovery of essential oils from plant materials that could not be processed by steam distillation. Petroleum naphthas, benzene, and alcohol are the primary solvents.

A procedure called expression is applied only to citrus oils. The outer coloured peel is squeezed in presses, and the oil is decanted or centrifuged to separate water and cell debris. The method is used for oil of sweet and bitter orange, lemon, lime, mandarin, tangerine, bergamot, and grapefruit. Much oil is produced as a by-product of the concentrated-citrus-juice industry.

Chemical composition. Terpenes, organic compounds consisting of multiples of isoprene

(containing five carbon atoms), are by far the most dominant constituents of essential oils. Individual oils, however, may contain appreciable quantities of straight chain, aromatic, or heterocyclic compounds. Thus allyl sulfides are characteristics of oil of garlic, traces of indole and anthranilic acid esters are found in orange oil, straight chain alcohols and aldehydes are recognized in oil of violets, and phenols and other aromatic compounds are common to many oils.

Terpenes are built up from units of the simple five-carbon molecule isoprene. Both hydrocarbons and oxygenated compounds such as alcohols, aldehydes, ketones, acids, esters, oxides, lactones, acetals, and phenols are responsible for the characteristic odours and flavours.

In some oils one or only a few components predominate: thus oil of wintergreen contains about 98 percent of methyl salicylate; orange

oil, about 90 percent of *d*-limonene; bois de rose, 90 percent of linalool; and cassia, up to 95 percent of cinnamaldehyde. In most oils there is a mixture of anywhere from a few dozen to several hundred individual compounds. Trace components are very important, since they give the oil a characteristic and natural odour.

Essential oils are generally expensive, with prices ranging from several U.S. dollars per kilogram on the low side to several thousand dollars per kilogram. The high price of the natural oils coupled with their limited availability has encouraged a search for substitutes. Great progress has been made in the synthesis of individual components such as geraniol, citral, linalyl-acetate, and the like. These synthetics have been combined with natural oils to extend supplies, and they have also been blended together in an attempt to duplicate the oils themselves. Such reconstituted oils usually lack certain of the odour notes of the natural products, because of absence of trace ingredients, often unidentified, that may be present in the natural oils. They also tend to have a more "chemical" odour, because of trace impurities in the synthetics that are different from the components of natural oils.

Essentuki (Russia): see Yessentuki.

Essequibo River, river in east central Guyana, the largest river between the Amazon and the Orinoco. It rises in the Acarai Mountains on the Brazilian border and flows northward for approximately 630 miles (1,010 km) through savannas and forests to the Atlantic Ocean. It reaches the Atlantic Ocean 13 miles (21 km) west-northwest of Georgetown, the national capital. Its estuary, 20 miles (32 km) wide, is obstructed by islands and silt. With its chief tributaries, the Rupununi, Mazaruni, and Cuyuni, its system drains more than half of Guyana.

The Essequibo is navigable by small ocean vessels to Bartica, 50 miles (80 km) inland, and by boats for long reaches between rapids. Its name is that of the old Dutch colony of Essequibo, settled from 1616 and one of the entities that joined together in 1831 to form British Guiana, now Guyana.

Essex, one of the kingdoms of Anglo-Saxon England; *i.e.*, that of the East Saxons. An area of early settlement, it probably originally included the territory of the modern county of Middlesex; London was its chief town. Essex sometimes had joint kings, and from 664 they were subject to the rulers of the midland kingdom of Mercia. From 825 Essex was controlled by Wessex, first as a subkingdom ruled by sons of the Wessex kings and then from 860 without separate existence. By the treaty made between King Alfred the Great and the Danish king Guthrum in 878, the latter acquired Essex, but it was won back by the Wessex dynasty early in the 10th century and was thereafter ruled by ealdormen, in origin royal household officials. Essex had been slow to accept Christianity wholeheartedly; an important missionary there was the Northumbrian Cedd (died 664), whose church at Bradwell-on-Sea still survives.

Essex, administrative, geographic, and historic county of eastern England, extending along the North Sea coastline between the Thames and Stour estuaries. The administrative county covers an area within the larger geographic county, which in turn covers a part of the original historic county of Essex. The administrative county comprises 12 districts: Basildon, Braintree, Epping Forest, Harlow, Maldon, Rochford, Tendring, Uttlesford, and the boroughs of Brentwood, Castle Point, Chelmsford, and Colchester. The geographic county also includes the unitary authorities of Southend-on-Sea and Thurrock. The historic county includes the area east of the River Lea as far south as its confluence with the Thames.

This area comprises the Greater London boroughs of Barking and Dagenham, Havering, Newham, Redbridge, and Waltham Forest. The historic county also includes the area around Great Chishill currently assigned to the South Cambridgeshire district in the administrative county of Cambridgeshire.

Essex is low-lying, with a flat coast that has many tidal inlets and islands. In Roman times Colchester became one of the few *coloniae* (municipalities) in Britain, and there are other Roman sites at Chelmsford, Great Chesterford, and Rivenhall. The 5th-century Saxon invaders were followed by the Danes, who won the Battle of Maldon in 991. Essex men, including the former Colchester priest John Ball, were prominent in the Peasant's Revolt of 1381. During the late Middle Ages Colchester became an important cloth-weaving centre.

With the construction of railways in the 19th century, seaside resorts at Southend and on the Tendring coast attracted Londoners for holidaymaking, retirement, and even commuting. More intense suburban development took place in the southwestern corner of the historic county, which became part of Greater London in 1965.

Because local stone was scarce, timber was the chief domestic building material during the Middle Ages, and many examples of medieval timber-framed houses, often plastered and colour-washed, survive. From the 16th century, brick was used for mansions, such as Audley End. Two Norman castles—Castle Hedingham and Colchester—survive.

Much of Essex continues to undergo industrial, residential, and recreational development as part of the metropolitan region centred on London. The port of London has increasingly shifted eastward from London's original Dockland in the East End to deep water on the lower Thames at Tilbury. The port of Harwich, in northeastern Essex, carries traffic to Scandinavia, Germany, and The Netherlands. Giant petroleum installations have been established on the Thames marshes at Shellhaven, Coryton, and Canvey Island. A nuclear power station was built at Bradwell-on-Sea.

Despite its proximity to London, much of Essex remains rural, and the county is highly farmed, producing cereals and supporting livestock enterprises.

Chelmsford, centrally situated, has long been the county headquarters and is also the seat of a church diocese. The University of Essex is at Colchester. Area administrative county, 1,331 square miles (3,448 square km); geographic county, 1,419 square miles (3,674 square km). Pop. (1998 est.) administrative county, 1,294,700; geographic county, 1,605,700.

Essex, town (township), Chittenden county, northwestern Vermont, U.S., on the Winooski River just east of Burlington. Chartered in 1763 and settled in 1783, it consists of the villages of Essex Junction and Essex Center. Essex Junction is a busy industrial and residential site where the Central Vermont Railroad and several highways converge; its railway depot serves as the depot for Burlington. Essex Center is a small, mostly residential settlement. The grounds of the Champlain Valley Exposition are nearby, as is the site of Fort Ethan Allen, used as a military reservation during the Spanish-American War and World Wars I and II but now occupied by private businesses and organizations. Pop. (2000) 18,626.

Essex, EARLS OF, titled English nobility of several creations, notably in the families Mandeville, Devereux, and Capel, grouped below chronologically and indicated by the symbol ●.

● **Essex, Geoffrey de Mandeville, 1st earl of** (d. Sept. 16, 1144, Mildenhall, Suffolk, Eng.), the worst of a number of cruel and lawless barons during the reign of King Stephen of England.

Geoffrey was a great landowner in Essex and elsewhere and hereditary constable of the Tower of London. He came to prominence in 1140 when Stephen, who could not dispense with his support against Matilda, a rival claimant for the throne, made him hereditary earl of Essex, by the earliest charter granting an English earldom extant or even known.

When Stephen was captured by Matilda's supporters (February 1141), Geoffrey deserted to her and was granted virtually viceregal powers in Essex. Before the rout of Matilda's force at Winchester (September 1141), Stephen's queen brought Geoffrey back to the royalist side by more concessions, possibly including the viceregal powers in London, Middlesex, and Hertfordshire, which were formally granted to him by Stephen in December 1141.

Arrested at St. Albans for treason against Stephen in 1143, he gave up his offices and castles in return for his freedom and went off to plunder the fenland around Ely, using Ramsey Abbey, which he fortified, as headquarters. It was here that his atrocities became a byword. Stephen besieged him in vain, but in August 1144 Geoffrey was mortally wounded by a chance shot while laying siege to Burwell, and he died the following month.

● **Essex, Thomas Cromwell, earl of:** see Cromwell, Thomas.

● **Essex, William Parr, earl of:** see Northampton, William Parr, marquess of.

● **Essex, Walter Devereux, 1st earl of, VISCOUNT HEREFORD, LORD FERRERS, LORD BOURCHIER** (b. Sept. 16, 1541, Carmarthen, Carmarthenshire, Wales—d. Sept. 22, 1576, Dublin), English soldier who led an unsuccessful colonizing expedition to the Irish province of Ulster from 1573 to 1575. The atrocities he committed there contributed to the bitterness the Irish felt toward the English.

He was the eldest son of Sir Richard Devereux and the grandson of Walter Devereux, Viscount Hereford, to whose title he succeeded in 1558. Sometime between 1560 and 1565 he married Lettice, daughter of Sir Francis Knollys. He served as "high marshal in the field" in the suppression of an insurrection in northern England in 1569, and in 1572 he was made earl of Essex. In the spring of 1573 he offered to subdue and colonize, at his own expense, a portion of Ulster that had not accepted English overlordship. The region was dominated by the rebellious O'Neills, led by Sir Brian MacPhelim and Turlough Luineach

O'Neill, and they were supported by the Scots-Irish under Sorley Boy MacDonnell.

Essex arrived in Ireland by autumn 1573. He was soon engaged in intrigues to divide his enemies, and he had difficulty obtaining the continued cooperation of Queen Elizabeth I and her lord deputy of Ireland, Sir William Fitzwilliam. His military operations took the form of raids characterized by brutal massacres of the populace. He treacherously captured Brian MacPhelim at a conference in Belfast in October 1574 and had MacPhelim and his wife and half brother, all of whom were his guests, executed at Dublin.

On advice from Robert Dudley, earl of Leicester, Elizabeth commanded Essex to "break off his enterprise" in 1575; before leaving Ireland, however, he defeated Turlough Luineach O'Neill, and he massacred several hundred of Sorley Boy's following, chiefly women and children, discovered hiding in the caves at Rathlin.

To compensate Essex for his losses in Ireland, Elizabeth bestowed on him a barony in Monaghan and the office of earl marshal of Ireland. He died of dysentery shortly after returning to Ireland from England in September 1576. There were suspicions that he had been poisoned by Leicester, who later married his widow, but these suspicions were not confirmed by the postmortem examination.

• **Essex, Robert Devereux, 2nd earl of, VISCOUNT HEREFORD, LORD FERRERS, LORD BOURCHIER** (b. Nov. 10, 1567, Netherwood, Herefordshire, Eng.—d. Feb. 25, 1601, London). English soldier and courtier famous for his relationship with Queen Elizabeth I

Robert Devereux, 2nd earl of Essex, detail of a painting after Marcus Gheeraerts the Younger, late 16th century, in the National Portrait Gallery, London

(reigned 1558–1603). While still a young man, Essex succeeded his stepfather, Robert Dudley, earl of Leicester (died 1588), as the aging queen's favourite; for years she put up with his rashness and impudence, but their relationship finally ended in tragedy.

Devereux was a cousin of Elizabeth on his mother's side, and when he was nine, he succeeded to the title held by his father, Walter Devereux, 1st earl of Essex. Young Essex first attained prominence by fighting bravely against the Spanish in the Netherlands in 1586. The following year Elizabeth made him master of the horse. Even at this early date he consistently provoked the Queen's anger while managing to remain in her favour. Contrary to her wishes, he took part in the English operation against Lisbon in 1589 and secretly married Frances Walsingham, widow of the poet Sir Philip Sidney, in 1590. In 1591–92 he commanded the English force in France, which helped King Henry IV, then still a Protestant, in his campaign against the French Roman Catholics.

For the next four years Essex remained in

England, becoming an expert on foreign affairs in an unsuccessful attempt to challenge the long-established ascendancy in this field of the Cecil family. He was made privy councillor in 1593 and in 1594 uncovered an alleged plot against the Queen's life by her physician, Roderigo Lopez.

When the revival of offensive operations against Spain in 1596 opened new opportunity for military adventure, Essex became one of the commanders of the force that seized and sacked Cádiz on June 22. This spectacular but indecisive action put him at the height of his fortunes and made him a leading advocate of a more vigorous strategy against Spain. A force that he commanded in 1597, however, failed to intercept the Spanish treasure ships at the Azores. Next year the possibility of peace with Spain sharpened his rivalry with the Cecils, while the growing seriousness of a major rebellion in Ireland led to bitter differences between Essex and Elizabeth over appointments and strategy.

By this time Elizabeth was growing alarmed by Essex' importunate ambition, finding him to be "a nature not to be ruled." During one of their disputes, Essex turned his back upon the queen, who promptly slapped his face. Nevertheless, in 1599 she sent him to Ireland as lord lieutenant. After an unsuccessful campaign against the rebels he concluded an unfavourable truce and, suddenly deserting his post, returned to England to vindicate himself privately to the Queen. She responded by depriving him of his offices (June 1600). Politically ruined and financially destitute but confined only to house arrest, he and 200 to 300 followers tried, on Feb. 8, 1601, to raise the populace of London in revolt. The poorly planned attempt failed, and Essex surrendered. He was executed at the Tower of London after being found guilty of treason. Francis Bacon, the scientist-philosopher for whose advancement in the government Essex had continually pressed, was one of the prosecutors at Essex's trial. Biographies include Robert Lacey, *Robert, Earl of Essex* (1970), and G.B. Harrison, *Life and Death of Robert Devereux, Earl of Essex* (1937).

• **Essex, Robert Devereux, 3rd earl of, VISCOUNT HEREFORD LORD FERRERS, LORD BOURCHIER** (b. January 1591, London—d. Sept. 14, 1646, London). English nobleman who commanded, with notable lack of success, the Parliamentary army against Charles I's forces in the first three years of the English Civil Wars.

Because his father, Robert Devereux, 2nd earl of Essex, had been executed for treason (1601), Devereux had to obtain special permission from Parliament to succeed (1604) to his family titles and estates. In 1606 King James I arranged Essex' marriage to Frances Howard, countess of Suffolk. But the countess soon fell in love with the King's Scottish favourite, Robert Carr, and in 1613 James had a divorce commission annul her marriage

Robert Devereux, 3rd earl of Essex, detail of an engraving by George Glover, 1646

so that she could marry Carr, who was also created earl of Somerset. Not surprisingly, the episode embittered Essex against the King.

Essex' military career began in 1620 with five successive campaigns in the Rhine valley in the Thirty Years' War, and in 1625 he was vice admiral in the unsuccessful expedition sent by James's son and successor, Charles I, against the Spanish port of Cádiz. Although Charles appointed him second in command of the bloodless Bishops' War against Scotland in 1639, Essex refused to stand by the King when his chief ministers were deposed by the Long Parliament (beginning November 1640).

In July 1642, Essex was appointed to command the Parliamentary army. He fought courageously against the royalists at the bloody but indecisive Battle of Edgehill in October 1642, and he advanced on London in 1643. But his 6,000-man army was besieged at Lostwithiel, Cornwall, in August 1644, and all surrendered except Essex, who escaped by sea. He resigned his command in April 1645, just before Parliament passed the Self-Denying Ordinance excluding its members from military command. He continued, however, to sit in Parliament and concerned himself with veterans affairs. He died without a surviving son and heir; the earldom of Essex became extinct in his line, though the viscountcy of Hereford went to a cousin. A recent biography is Vernon Shaw, *Essex the Rebel* (1970).

• **Essex, Arthur Capel, 1st earl of, VISCOUNT MALDEN, BARON CAPEL OF HADHAM** (b. 1631/32—d. July 13, 1683, London). English statesman, a member of the "Triumvirate" that dominated policy at the time of the Popish Plot (1678).

The son of Arthur Capel, 1st Baron Capel, who was executed by the Parliamentarians in

Arthur Capel, 1st earl of Essex, detail from a diptych by Sir Peter Lely; in the Staatliche Graphische Sammlung, Munich

1649, he was, after the Restoration of Charles II, created Viscount Malden and earl of Essex (April 1661). Although his antagonism to court life, to Roman Catholicism, and to extension of the royal prerogative alienated Charles II, he was nevertheless appointed to a succession of offices. As lord lieutenant of Ireland (1672–77), Essex purged the country's financial administration, repelled attempts to exploit the Irish land market, and generally endeavoured to improve the condition of Roman Catholics. As a lord of the treasury (March–November 1679), he worked with the earls of Halifax and Sunderland, at first supporting Halifax' scheme to impose statutory limitations should the Roman Catholic duke of York (afterward James II) become king.

His political attitude became more and more intolerant of the Roman Catholic flavour of the court, and, as member of the Privy Council, he joined Anthony Ashley Cooper, 1st earl of Shaftesbury, in voting (November 1680) for the exclusion of James from the succession. A fervent Protestant, he may have taken part in the Rye House Plot (June 1683) to assassinate

the allegedly pro-Catholic Charles II and his brother James, and he was certainly among the supporters of Charles's illegitimate Protestant son, James Scott, Duke of Monmouth. He was arrested and imprisoned in the Tower of London, where he was found with his throat cut. The violence with which the wound had been inflicted made it uncertain whether or not his death was a suicide. If suicide, his motive may have been to prevent an attainder and preserve his titles and estates for his family. He had one surviving son, Algernon (1670–1710), 2nd Earl of Essex.

Essex Decision, decision rendered by the British High Court of Admiralty in 1804 and confirmed the following year, which contributed to the bad feeling between the United States and Great Britain that eventually led to the War of 1812. Britain and France were at war, and the American merchant vessel *Essex* had been captured by the British while transporting goods from the French West Indies to France. Because U.S. merchant vessels were forbidden by the British to carry cargo directly between the French colonies and France, American ships evaded this prohibition by interrupting the voyage with a stop at an American port. The court, citing a precedent of 1756, disallowed the legality of this practice and ruled that such a stop did not constitute an interruption of the voyage. The British were thus given broader legal sanction for action against neutral ships trading with France.

Essex Junto, in early U.S. history, a group of Federalist political leaders in Massachusetts. John Hancock coined the name for his Essex County opponents at the state constitutional convention of 1778. The Junto (faction) later supported the policies of the Federalist Alexander Hamilton and opposed those of Thomas Jefferson.

Like Hamilton, the Junto leaders supported neutrality, wanted friendship with Britain, and opposed Revolutionary France. In 1803–04, during Jefferson's first administration, they tried unsuccessfully to form a separate confederation based in New England. They were against Jefferson's anti-British Embargo Act and eventually brought about its repeal (1809). Their lack of sympathy with the War of 1812 led the Junto to participate in the secessionist Hartford Convention of 1814. After the war they lost their importance. Timothy Pickering was the group's most conspicuous leader.

essexite, dark gray to black, fine-grained, intrusive igneous rock that occurs in Essex County, Mass.; at Mount Royal, near Montreal; near Oslo, Nor.; at Roztoky, Czech Republic; and at Carclout, Scot. It contains plagioclase as the dominant feldspar, as well as orthoclase feldspar, augite, biotite, hornblende, olivine, and nepheline. As the proportion of nepheline increases, essexite grades into theralite.

Essling, André Masséna, Prince d': see Masséna, André.

Esslingen, in full **ESSLINGEN AM NECKAR**, city, Baden-Württemberg *Land* (state), southwestern Germany. It lies along the Neckar River, just southeast of Stuttgart. Mentioned in 777 as Cella and in 866 as Hetsilinga, it was chartered about 1219. It was a free imperial city from 1360 to 1802, when it passed to Württemberg, the rulers of which had often threatened it.

On a commanding height above the city stands the old citadel, and in the inner town are three town halls: the old Rathaus (c. 1430); the new Rathaus, formerly a palace; and the Baroque Rathaus (1746) of the imperial city,

Dickerturm (round tower), Esslingen, Ger. De Wys Inc

now used as a district court. The building of the Church of Our Lady (Frauenkirche; 1321–1516) marked the beginning of the special Swabian Gothic style. St. Paul's (1233–68) is the oldest existing Dominican church in Germany.

The centre of a fertile wine-producing and fruit-growing district, the town has machine, electrical, textile, and leather works. Pop. (1991 est.) 91,685.

Esso, any of several foreign affiliates of the Exxon Corporation (*q.v.*).

essonite (mineral): see hessonite.

Essonne, département, Île-de-France *région*, northern France; it includes some of the southern outer suburbs of Paris. The *département* was created in 1964 from the southern part of the former Seine-et-Oise *département*.

Chiefly consisting of a plateau of agricultural and forest land cut by deep valleys, the *département* is watered by the Essonne, the Orge, and their tributaries, which flow into the Seine River from the west. The Seine crosses the *département*'s northeast corner, passing through Corbeil-Essonnes, and is heavily industrialized on the left bank as it approaches the Paris area. At the northern departmental boundary the Seine is joined from the east by the Yerres River, which flows through pleasant suburbs near the forest of Sénart. The northeast part of the *département*, in which the Paris-Orly Airport terminal is located, is also crossed by the Autoroute du Sud, the motorway from Paris to the Mediterranean. The southwest embraces part of the Beauce plain, which is a major grain-producing area of France. In the southeast the region of Milly-la-Forêt, adjoining the Forest of Fontainebleau, is a popular area for weekend tourists.

The administrative centre of the *département* is at Évry, close to Corbeil-Essonnes; there are two other *arrondissements*, Étampes and Palaiseau. Essonne is in the educational division of Versailles. Area 696 square miles (1,804 square km). Pop. (1991 est.) 1,096,300.

Est, Thomas: see East, Thomas.

established church, a church recognized by law as the official church of a state or nation and supported by civil authority. Though not strictly created by a legal contract, the legal establishment is more like a contractual entity than like anything else and, therefore, ordinarily cannot be varied or repudiated by only one party to it. The church is not free to make changes in such things as doctrine, order, or worship without the consent of the state. In accepting such obligations, the church usually, though not always, receives financial support and other special privileges.

Among numerous examples of established churches or state religions are the following: Anglicanism in England, Lutheranism in

Scandinavian countries, Roman Catholicism in Italy and Spain, Judaism in Israel, Islām in Saudi Arabia and Egypt, Buddhism in Thailand and Sikkim, and Shintō in Japan before World War II. In pluralistic societies and under modern forms of government, religious establishment has tended, on the whole, to diminish in importance.

Estado de S. Paulo, O (Portuguese: "The State of São Paulo"), influential newspaper published daily except Monday in Brazil's largest city. *O Estado* is widely respected for its thorough coverage of national and international news, its publication of the texts of speeches of important government officials, and other matter usually found in a country's newspaper of record. *O Estado* is sometimes called "The New York Times of Latin America" because of its grave editorial demeanour.

Since shortly after its founding in 1875, *O Estado* has been owned by the Mesquita family. On occasion its independence has brought on government censorship and harassment of reporters, and its editor went into exile during the Vargas regime, which ended in 1945. Once boycotted by the German-speaking community in Brazil because of its support of the Allies, *O Estado* is generally friendly to the United States and encourages the cultivation of European arts and culture. Its editorial outlook is normally pro-industry, and, because of its immense prestige, *O Estado de S. Paulo* exerts an unusually profound influence on national and local politics.

Estado Novo (Portuguese: "New State"), the dictatorship (1937–45) of President Getúlio Vargas of Brazil, initiated by a new constitution issued in November 1937. Vargas himself wrote it with the assistance of his minister of justice, Francisco Campos.

In the election campaign of 1937 Vargas warned of a threatened Communist coup d'état and declared a 90-day state of emergency, issuing the *Estado Novo*. The fascist Integralistas applauded this dictum, but they were outwitted by Vargas when he suddenly used his dictatorial powers to announce that he would succeed himself without election and proceeded to dissolve the Congress. He further declared that the constitution contained in his pronouncement would not be effective while the emergency lasted and would then be brought to a plebiscite, after which the people could elect a new congress.

The plebiscite, however, was never conducted, and Vargas ruled for the next seven years by decree, pending a congressional election. Vargas and his appointees more or less dominated all aspects of national life; but the dictatorship, suggestive of contemporary fascist states, was somewhat alleviated by its inefficiency. Widespread disaffection with Vargas finally forced him out of power, in spite of a campaign by his supporters, the Queremistas, to have him reelected in 1945, after he had bowed to pressure to permit elections.

Estaing, Charles-Hector, Count (comte) **d'**, in full **JEAN-BAPTISTE-CHARLES-HENRI-HECTOR, COUNT D'ESTAING, MARQUIS DE SAILLANS** (b. Nov. 24, 1729, Ruvel, Auvergne, France—d. April 28, 1794, Paris), commander of the first French fleet sent in support of the American colonists during the U.S. War of Independence.

D'Estaing served in India during the Seven Years' War and was governor of the Antilles (1763–66). He was appointed vice admiral in 1767 and in 1778 attempted to surprise the English squadrons in North America and enable the colonists to resume the offensive. His blockade of Admiral Howe in New York Bay proved unsuccessful (July 1778), and in August storms prevented him from engaging the

British fleet near Newport, R.I. In November he sailed for the Antilles, where, despite several opportunities, he failed to eliminate a much smaller British squadron. He was seriously wounded in an unsuccessful attack on Savannah, Ga. (September–October 1779), and returned to France with his squadron. D'Estaing was an energetic commander, but his lack of naval experience caused him to be diffident before smaller British forces. His caution and hesitancy greatly disappointed the colonists during a crucial phase of the war.

In France, d'Estaing was an enlightened reformer; he was elected to the Assembly of Notables in 1787. He was commander of the National Guard at Versailles at the outbreak of the Revolution (1789) and was guillotined in Paris during the Terror.

estampie, Provençal ESTAMPIDA, courtly dance of the 12th–14th century. Mentioned in troubère poetry, it was probably danced with sliding steps by couples to the music of vielles (medieval viols); its afterdance was the saltarello. In musical form the estampie derives from the sequence, a medieval genre of Latin hymn. Like the sequence it has a series of repeated melodic phrases (*aa, bb, cc, . . .*); phrase endings in the repetitions are often varied.

Estampies are among the earliest surviving examples of written instrumental music. The famous troubadour song "Kalenda maya" (by Raimbaut de Vaqueyras, died 1207) is a poem set to an existing estampie. Whether the estampie was identical with, or merely related to, the *stantipes*, a dance mentioned in the 13th century, is debated by scholars.

estancia, in the Río de la Plata region of Argentina and Uruguay, an extensive rural estate largely devoted to cattle ranching and to some extent to the raising of feed grain.

From the late 18th century *estancieros* (owners of estancias) began to acquire tracts of land in the pampas (grasslands) of Argentina, which by the late 19th century had been almost entirely fenced in to form these estates. By 1900 about 300 families owned most of the Argentine pampas, each with an estancia measured in hundreds of thousands of acres. A similar situation obtained in Uruguay.

Like the *fazendeiro* in Brazil and the *hacendado* in Mexico, the *estanciero* exercised wide lawmaking and judicial powers over his tenant farmers and servants. These powers, reminiscent of those exercised by the feudal nobles of medieval Europe, were often abused by the *estancieros* themselves or by overseers, who were left in charge while the landlords lived in luxury in South American or European cities.

The extensive political power of the *estancieros* in Argentina was somewhat lessened during the regime of the dictator Juan Perón (ruled 1946–55), who based his power on the support of the lower middle and working classes.

estate tax, levy on the capital value of property changing hands at the death of the owner, fixed mainly by reference to its total value. Estate tax is generally applied only to estates evaluated above a statutory amount and is applied at graduated rates. Estate tax is usually easier to administer than inheritance tax (*q.v.*) levied on beneficiaries because only the value of the entire estate need be ascertained.

The estate tax was first instituted in Great Britain in 1889 as part of a broad death tax program, and in 1949 it became the only death tax levied there. It was first imposed in the U.S. in 1916, to help finance mobilization for World War I.

Various means have been used to avoid or reduce the estate tax, including gifts, generation-skipping trusts, and the creation of lim-

ited interests in the estate. These avoidances have given rise to gift taxes and other death taxes. In Great Britain trusts are treated as if the property were owned by the income beneficiaries.

Critics of the estate tax have claimed that it often forces the sale of small family-owned farms and businesses because the tax is based on the value of the estate but there may not be enough cash available to pay it. General tax reform legislation passed by the U.S. Congress in 1976 contained provisions designed to mitigate this effect of the tax laws.

Estates-General, also called STATES GENERAL, French ÉTATS-GÉNÉRAUX, in France of the pre-Revolutionary monarchy, the representative assembly of the three "estates," or orders of the realm: the clergy and nobility—which were privileged minorities—and a Third Estate, which represented the majority of the people.

The origins of the Estates-General are to be found in traditions of counsel and aid and the development of corporate representation in the 13th century. The first national assembly of representatives of the three estates met in April 1302 to aid Philip IV the Fair against Pope Boniface VIII. There were several general comparable meetings, to obtain political or financial support, in the first half of the 14th century. But it became clear during the Hundred Years' War, if not before, that the Estates-General were too unwieldy (and too unyielding) to become an institutional organ of consent. The attempt of such assemblies to take administrative initiative in the 1350s failed not only because of the assassination of the bourgeois reformist Étienne Marcel but also because of provincial dissatisfaction. Although general Estates were occasionally summoned during the next century, their constitutional functions were, in many areas, assumed by provincial Estates, which were easier to attend, easier to manage, and better in keeping with regional custom.

By the end of the 15th century the Estates-General could be said to have acquired its main characteristics, but it was not, nor would it ever become, an institution. Because the kings had already levied a permanent direct tax throughout France (the *taille*), they were able to get along without the Estates-General in normal times after 1500. Francis I, who reigned from 1515 to 1547, never summoned the Estates-General, which thereafter met only in times of crisis, such as during the Wars of Religion in the late 16th century.

The Estates-General of 1614, held during the minority of Louis XIII, revealed one of the body's major weaknesses—the inability of the three orders to agree because of conflicting interests. The Third Estate refused to consent to the abolition of the sale of offices unless the nobles surrendered some of their privileges, and the meeting ended without action.

The next and last meeting of the Estates-General was at the beginning of the French Revolution (1789), in the face of a financial crisis, widespread agitation, and the weakening power of the king. The deputies of the Third Estate, fearing that they would be overruled by the two privileged orders in any attempt at reform, led in the formation of the revolutionary National Assembly (June 17), signalling the end of representation based on the traditional social classes.

Estaunié, Edouard (b. Feb. 4, 1862, Dijon, Fr.—d. April 1, 1942, Paris), French writer, known for his novels of character. He was by profession an engineer and ended his career as inspector general of telegraphs. He was elected (1923) to the Académie Française.

A theme recurrent in the 12 novels of Estaunié is expressed by the title of one of them, *La Vie Secrète* (1908; "The Secret Life"); each man's outward life masks another, ill-understood, different, and usually much more

important life which may break through the mask unexpectedly to take temporary control of him. The novels gain distinction from their profound and detailed psychological analysis. The more important of them are *L'Empreinte* (1895), *Les Choses voient* (1912), *L'Ascension de Monsieur Baslèvre* (1920), and *L'Appel de la route* (1922).

Este, town and episcopal see of Padova province, in the Veneto region of northern Italy at the southern foot of the Colli (hills) Euganei southwest of Padua. Known in antiquity as Ateste (*q.v.*), it was for long the principal seat of the Veneti (*q.v.*), before being absorbed by Rome c. 200 BC. Originally on the Adige River, it was completely abandoned after the river (now 9 mi [14 km] to the south) changed course in the 6th century. Although it never regained its early importance, it was known in the Middle Ages as the place of origin (961) and the seat (1056–1288) of the House of Este. After 1288 it passed through numerous hands before becoming Venetian in 1405. Notable landmarks are the ruins of the old castle (founded c. 1056, rebuilt 1339), the cathedral (1690–1720), and the Museo Nazionale Atestino (National Museum of Atestine Artifacts). It is now primarily an agricultural centre with some manufacturing. Pop. (2000) mun., 17,031.

Este, HOUSE OF, princely family of Lombard origin that played a great part in the history of medieval and Renaissance Italy. It first came to the front in the wars between the Guelfs and Ghibellines during the 13th century. As leaders of the Guelfs, Estensi princes received at different times Ferrara, Modena, Reggio, and other fiefs and territories. Members of the family ruled in Ferrara from the 13th through 16th century and in Modena and Reggio from the later Middle Ages to the end of the 18th century.

Origins. The Estensi were a branch of the great 10th-century dynasty of the Obertenghi, which held power and wealth in Lunigiana, Genoa, and Milan and which also gave rise to the feudal houses of the Malaspina, the Pallavicini, and the margraves of Massa and Parodi. Subsequently, after various vicissitudes, the members of the Obertenghi dynasty removed to the lands of the Venetians, where they had estates at Este, Monselice, Rovigo, and Friuli. The Estensi took their name from the township and castle of Este, 17 miles (27 kilometres) southwest of Padua, and the true founder of the family was the margrave Alberto Azzo II (died 1097). From his son Welf IV, duke of Bavaria, there began a related branch that gave origin to the dukes of Bavaria, Brunswick, and Lüneburg, as well as the electors of Hanover. Another son, Ugo, tried without success to establish in France, while a third son, Folco I (died c. 1136), became second in line in the House of Este. Neither he nor his successor, Obizzo I (died 1193), however, achieved any great distinction, beyond the offices and titles that fell naturally to the upper feudal families; but it was during the lifetime of Obizzo I that the Estensi first acquired political importance in Ferrara, through the marriage of his son (Azzo V, who predeceased him) to the heiress of one of the two great and rival families of Ferrara. Obizzo was succeeded by his grandson, Azzo VI, who acquired considerable authority in the city, though his premature death in 1212 left the family temporarily weakened. Not until 1240 did a descendant, Azzo VII, return to power in the city, in alliance with the Guelf league formed by Pope Gregory IX. This marked the true beginning of Este rule in Ferrara.

Lords of Ferrara. In 1264 Azzo's heir, Obizzo II (1264–93), was created perpetual lord by the people of Ferrara under the pressure of Guelf strength. The Pope, lawful lord of the Ferrarese territory, at first did not oppose this action but afterward began to

contest the Estensi government. Obizzo II's power was growing, however, and he had himself chosen lord of Modena in 1288 and of Reggio in 1289. In the 14th century the house of Este went through difficult, stormy periods, not only because of its controversies with the papacy but also because of domestic dissensions, sometimes very hazardous. The house succeeded, nevertheless, in strengthening its position, and, under Nicolò II (reigned 1361–88), called the Lame, there was built the famous Este Castle, the work of the architect Bartolino da Novara, which became a symbol of the power of the city of Ferrara and a sure defense against external dangers. To the brother and successor of Nicolò II, Alberto V (reigned 1388–93), is due the erection of the University of Ferrara, destined for lasting fame; it was obtained by Pope Boniface IX as a concession in 1391.

The reign of Nicolò III (1393–1441), son of Alberto, marked the strengthening of Estensi domination in Ferrara and the introduction of Estensi influence generally in Italian politics. After having defeated an attempt by the Paduans to achieve hegemony in Ferrara, the Estensi duke became intermediary in the political and military contests in the Italian states and extended his dominions. Personally, Nicolò was known for his sensuality; a Ferrarese saying runs, "On both sides of the River Po they all are Nicolò's sons." He had his son Ugo and his young second wife, Parisina Malatesta, beheaded because they were found guilty of adultery together. But he devoted himself to the exterior manifestations of a religious faith—going on a pilgrimage to the Holy Sepulchre and to Vienna's Saint Anthony and playing host to the ecumenical council in 1438 that represented a fruitless attempt to bring together again the Western and Eastern churches. (This council was afterward transferred to Florence.) He even seems to have come close to obtaining the succession of an Estensi heir to the Milanese states, but he died suddenly, perhaps poisoned, on Dec. 26, 1441.

Whereas Nicolò III raised the Estensi state to a high position in Italian politics in spite of its territorial and financial limits, his bastard son and chosen successor, Leonello (reigned 1441–50), gave Ferrara considerable distinction in the fields of art and culture. Leonello had been educated by the humanist Guarino Veronese, called to Ferrara by his father, and the period of his reign was one in which Ferrara represented a lively centre of culture and humanism, filled with painters (Pisanello, Jacopo Bellini, Rogier van der Weyden, Andrea Mantegna), architects (Leon Battista Alberti), and scholars (centring on Guarino Veronese).

Dukes of Ferrara, Modena, and Reggio. Leonello's brother and successor, Borso (reigned 1450–71), notwithstanding some military failures, not only maintained his state and increased its aesthetic and cultural prestige but also received from the Holy Roman emperor Frederick III the title of Duke of Modena and Reggio (1452) and from Pope Paul II the title of Duke of Ferrara (1471).

Ercole I. The long rule of Leonello's and Borso's half-brother Ercole I (1471–1505) marked one of the most important periods for the history of the house of Este and of Ferrara. He succeeded in obtaining considerable political support with his marriage to Leonora, the daughter of the king of Naples. These were troubled times, however. Ercole had to defeat the attempt of a nephew, Nicolò, son of Leonello, to usurp the throne; and then he had to face the hostile coalition of Venice and Pope Sixtus IV, which brought war nearly to the walls of the city of Ferrara (1482–84). The subsequent Peace of Bagnolo, however, though not entirely satisfactory, did free Ferrara from immediate dangers.

Ercole's crucial problem became one of consolidating his own political position by means

of marriages that would bind him to the principal Italian powers: of his three daughters, Lucrezia was married to Annibale Bentivoglio (of Bologna), Isabella to Francesco Gonzaga (of Mantua), and Beatrice to Ludovico Sforza (of Milan). Ercole's eldest son, Alfonso, was married first to Anna Sforza (of Milan) and then to the famous Lucrezia Borgia, the daughter of Pope Alexander VI. In spite of these difficult affairs of state, Ercole was able to continue his dynasty's patronage of the arts, taking the poet Matteo Boiardo as his minister, extending his favour to the poet Ludovico Ariosto, espousing the theatre and musical arts, and enlarging and beautifying Ferrara to such an extent as to make it one of the first cities of Europe.

Alfonso I. Ercole's son Alfonso I (reigned 1505–34), rough and rude when he was young, proved wise and sure of himself once he had taken the reins of government. First he foiled a plot of a stepbrother, Giulio, and another brother, Ferrante, against him and sentenced them to perpetual imprisonment. Then his attention was completely attracted by the war against Venice (1509), in which his skill in mechanics and artillery design was proved. He was victorious in the naval battle of Polesella and won back the Polesine of Rovigo (which had been lost by Ercole I). At the same time, however, papal ambitions of territorial expansion became threatening. By consistent adherence to the French interest in Italy, Alfonso came into collision with Pope Julius II and was deprived of Modena (1510) and Reggio (1512) and was excommunicated. The Medici popes, Leo X and Clement VII, were both determined on the destruction of the Estensi, but the first-mentioned pope was frustrated by death, the second by political weakness, and Alfonso was able to recover Reggio in 1523 and Modena in 1527. He died in 1534. His succession was assured not only by his legitimate children but also by the issue of his lover Laura Eustochia Dianti, from whom derived the future dukes of Modena and Reggio.

Ercole II and Alfonso II. During the reign of Alfonso's son and successor Ercole II (1534–59), the military events proved less interesting (though the wars of 1557–58 were difficult) than the personal ones. Ercole married Renée, daughter of King Louis XII of France, and in Ferrara she came to embrace the Lutheran religion, becoming its ardent defender and establishing at her court a meeting place for the most famous heretics and liberal thinkers of the day. Ercole, who was the pope's vicar in Ferrara, tried restraining her, even to the point of temporary imprisonment, but to no avail. Next to rule was his first-born, Alfonso II (reigned 1559–97), the fifth and last duke of Ferrara. He also tried, vainly, to be elected king of Poland and to organize a crusade against the Turks. More important for the dynasty, however; was the fact that, though Alfonso II had three marriages, he had no children, and Pope Pius V in 1567 expressly forbade having illegitimate children rule in ecclesiastical lands. Alfonso was so disappointed and discouraged that he let the conditions of his state decay. At his death he bequeathed the duchy to his cousin Cesare, but Pope Clement VII refused to recognize the settlement, declaring Cesare illegitimate; in 1598 direct papal rule was established in Ferrara. The main branch of the Este family had come to an end.

Decline of power. Cesare kept Modena and Reggio, but with him the Estensi ceased to play so important a part in Italian politics, and the court was culturally inferior to its brilliant predecessors. Among the several Modenese dukes who followed in the 17th century, Francesco I (reigned 1629–58), who came to the throne during the stormy period of the Thirty Years' War, was perhaps the most important. His people were able to survive the famous plague of 1630. In the wars he was first allied to Spain, then to France, whose alliance

he thought would best sustain his claims to Ferrara. Later on, he attempted reconciliation with Spain, but ironically it was on the field of battle, fighting the Spaniards, that he died of malaria. He was a man with enormous aspirations, and, though inclined toward treachery in politics, he gave art his patronage, favouring men of letters and collecting works of art (there is an extraordinary portrait of him by Diego Velázquez and a beautiful bust by Gian Lorenzo Bernini).

Among his successors, the one most deserving to be remembered is Rinaldo I (1694–1737), whose marriage to Charlotte Felicitas of Brunswick-Lüneburg reunited the long-separated branches of the house of Este. Throughout his reign he engaged in imperial politics. His son Francesco III (1737–80), known as a libertine, received the governorship of Lombardy from Empress Maria Theresa of Austria. Ercole III (1780–96), gentle and affable, abandoned Modena in 1796 when the Revolutionary French army invaded it.

After the Napoleonic Wars, Duke Francesco IV (1814–46), son of Maria Beatrice d'Este (the only surviving daughter of Ercole III) and of Archduke Ferdinand of Habsburg-Lorraine, son of Maria Theresa, came back to Modena. He founded the Austro-Este line in Modena, which, however, ended with his son Francesco V (1846–59) when Modena revolted in order to join Sardinia-Piedmont and then Italy.

Childless, Francesco V selected as his universal heir Francis Ferdinand, heir to the Austrian throne, who was murdered at Sarajevo in 1914. Today, the rightful holder of the surname and heraldic bearings of the Estensi is considered to be Archduke Robert, the second-born of Charles I of Austria and Zita of Bourbon-Parma. In 1953 he married the princess Margherita of Savoy-Aosta.

(L.Ch.)

BIBLIOGRAPHY. There are few works on the Este family in English. Werner L. Gundersheimer, *Ferrara: The Style of Renaissance Despotism* (1973), recounts the rule of Nicolò III and of his sons. Trevor Dean, *Land and Power in Late Medieval Ferrara: The Rule of the Este, 1350–1450* (1988), focuses on the period during which the Este's state was transformed from a family lordship into a politically stable principality.

Este, Marie Beatrice d': see Mary of Modena.

Este, Thomas: see East, Thomas.

Esteban Echeverría, partido (county) at the southern limits of Greater Buenos Aires, Argentina, in Buenos Aires *provincia*. Created in 1913 from portions of the *partidos* of Lomas de Zamora and San Vicente, Esteban Echeverría agricultural (and, more recently, low-income suburban) zone with an area of 146 square miles (377 square km), characterized by green villas that support dairy farms and orchards of fruit trees. Ezeiza, the major international airport of Buenos Aires, is located there. The *cabecera* (county seat) is Monte Grande. Pop. (1980) 188,923.

Estébanez Calderón, Serafín, Estébanez also spelled ESTÉBANES, byname EL SOLITARIO (b. Dec. 27, 1799, Málaga, Spain—d. Feb. 5, 1867, Madrid), one of the best-known costumbristas, Spanish writers who depicted in short articles the typical customs of the people. He moved to Madrid in 1830, where he published newspaper articles under the pseudonym El Solitario and pursued a career that combined Arabic studies, poetry, and the collecting of manuscripts. He was also influential in the government.

Esteli, city, northwestern Nicaragua. It lies along the Esteli River in the central highlands, at an elevation of 2,674 feet (815 m). A Spanish settlement founded near prehis-

toric carved-stone figures, it was a scene of heavy fighting between Sandinista guerrillas and government troops in 1978–79 that left much of the centre of the city in ruins. Estelí is an agricultural and commercial centre, with sawmilling, tanning, and the manufacturing of hats. It lies on the Pan-American Highway north of Managua, the national capital. The surrounding area, despite its rugged relief, is important for the production of livestock, cotton, tobacco, sesame, cheese, and various fruits and vegetables. Pop. (1985 est.) 30,635.

Estenssoro, Víctor Paz: see Paz Estenssoro, Víctor.

ester, any of a class of organic compounds that react with water to produce alcohols and organic or inorganic acids. Esters derived from carboxylic acids are the most common.

Carboxylic acid esters, formula RCOOR' (R and R' are any organic combining groups), are commonly prepared by reaction of carboxylic acids and alcohols in the presence of hydrochloric acid or sulfuric acid, a process called esterification. In the reaction the hydroxyl group (OH) of the carboxylic acid is replaced by the alkoxy group (R'O) of the alcohol. The reverse of the reaction is an example of hydrolysis (*q.v.*). Esters may also be obtained by reaction of acid halides or acid anhydrides with alcohols or by reaction of salts of carboxylic acids with alkyl halides. One ester may be converted to another ester by reaction (transesterified) with an alcohol, a carboxylic acid, or a third ester in the presence of a catalyst.

The hydrolysis of esters in the presence of alkalis, a reaction called saponification, is utilized in the preparation of soaps from fats and oils and is also used for the quantitative estimation of esters.

Carboxylic acid esters of low molecular weight are colourless, volatile liquids with pleasant odours, slightly soluble in water. Many are responsible for the fragrance and flavour of flowers and fruits; for example, isopentyl acetate is present in bananas, methyl salicylate in wintergreen, and ethyl butyrate in pineapples. These and other volatile esters with characteristic odours are used in synthetic flavours, perfumes, and cosmetics. Certain volatile esters are used as solvents for lacquers, paints, and varnishes; for this purpose, large quantities of ethyl acetate and butyl acetate are commercially produced. Waxes secreted by animals and plants are esters formed from long-chain carboxylic acids and long-chain alcohols. Fats and oils are esters of long-chain carboxylic acids and glycerol.

Liquid esters of low volatility serve as softening agents for resins and plastics. Esters also include many industrially important polymers. Polymethyl methacrylate is a glass substitute sold under the names Lucite and Plexiglas; polyethylene terephthalate is used as a film (Mylar) and as textile fibres sold as Terylene, Fortrel, and Dacron.

Esters are also formed from alcohols and such inorganic acids as sulfuric, phosphoric, and nitric acids. Nitrate esters (*e.g.*, glyceryl trinitrate, or nitroglycerin) are explosive. Phosphate esters are biologically important (nucleic acids belong to this group) and are used widely in industry as solvents, plasticizers, flame retardants, gasoline and oil additives, and insecticides.

Esters of sulfuric and sulfurous acids are used in the manufacture of dyes and pharmaceuticals. Dimethyl sulfate, the best-known ester of sulfuric acid, is a dangerous poison.

Esterhazy, town, southeastern Saskatchewan, Canada. It lies in the Qu'Appelle River valley, 132 miles (212 km) east of Regina. It is named after Count Paul Otto d'Esterházy

Potash mine at Esterhazy, Sask.
George Hunter—Shostal

(1830–1912), a French-Hungarian nobleman who promoted settlement in the area. Esterhazy is a marketing town for a mixed-farming (especially wheat) and stock-raising region and has flour-milling and dairying industries. Since 1962, however, it has been noted for its potash production; two shaft mines, among the largest on the continent, operate north and east of town. Inc. village, 1903; town, 1952. Pop. (1991) 2,896.

Esterházy FAMILY, also spelled **ESZTERHÁZY**, aristocratic Magyar family that produced numerous Hungarian diplomats, army officers, and patrons of the arts.

By the 18th century the Esterházy had become the largest landowners in Hungary, and they came to possess a private fortune even larger than that of the Habsburg emperors whose supporters they were. The various members of the family continued to hold important governmental, ecclesiastical, diplomatic, and military posts in Hungary well into the 20th century.

Ferenc Zserházy (1563–94), deputy lord lieutenant of the county of Pozsony (now Bratislava, Slovakia), was the first family member of historical importance. He took the name Esterházy upon becoming baron of Galántha, an estate the family had acquired in 1421. With his sons the family was divided into the lines of Fraknó, Csesznek, and Zólyom.

Miklós (1582–1645) founded the Fraknó line, which became the most prominent of the three. He opposed the Protestant champions Gábor Bethlen and György Rákóczi I while upholding the idea of freeing Hungary from Turkish dominance through a consolidation of Habsburg dynastic power. He was honoured by the Holy Roman emperors Matthias and Ferdinand II, and at the Diet of Sopron (1625) he was appointed palatine (imperial governor) of Hungary.

Miklós' third son, Pál (1635–1713), founded the princely branch of the Fraknó line. Distinguishing himself in wars against the Turks, he was made commander in chief of southern Hungary in 1667 and participated in the deliverance of Vienna in 1683, two years after his election as palatine. For his devotion to the Habsburgs, he was created prince of the empire in 1687. A devotee of the arts and sciences, Pál also wrote several religious works.

Prince Pál Antal (1711–62) was a grandson of the first prince and became a field marshal. Prince Miklós József (d. 1790), brother of Pál Antal, was also an outstanding soldier and a patron of the arts. He rebuilt Esterháza, the family castle, in such magnificent Renaissance style that it came to be known as the Hungarian Versailles, and he employed Joseph Haydn as conductor of his orchestra for 30 years.

Prince Miklós (1765–1833), the grandson of Miklós József, is best remembered for his great collection of paintings and engravings in Vienna and for his actions against the French during the Napoleonic Wars. He raised a regiment at his own expense to fight the French in Austria, and, despite Napoleon's overtures to him in 1809 suggesting the Magyars elect Miklós as king, he refused the honour and continued to defend Habsburg interests. His son Prince Pál Antal (1786–1866) served as a diplomat in London and Paris. During the Napoleonic Wars Pál Antal was secretary of the Austrian embassy in London and later (1807) in Paris under Klemens von Metternich. After the peace settlement (1815), he became ambassador to England. He represented Austria at the coronation of Charles X of France and at the London conference (1830–38). He served as minister of foreign affairs in Hungary's first responsible cabinet in 1848, but he resigned that post after finding no satisfactory way to reconcile court and nation and spent his final years in obscurity.

The counts of the Fraknó line belonged to the junior branch of the Fraknó Esterházy, which was split into three lines by the sons of Ferenc Esterházy (1641–83), brother of the first prince, Pál. Count Antal (1676–1722), the first son of Ferenc, distinguished himself in wars both against and in league with Ferenc Rákóczi II, an anti-Habsburg Magyar noble and national hero. Antal accompanied Rákóczi in 1710 to Poland and later to France and to Turkey, where he died in exile.

Count Miklós Bálint (1740–1806), whose father, József Bálint, was Count Antal's son, had entered the service of France. Miklós Bálint became a favourite of Marie Antoinette and also stood in favour with the Count d'Anjou (later Charles X of France). During the French Revolution Miklós Bálint helped many royalists emigrate.

Esterhazy, Ferdinand Walsin, in full **MARIE-CHARLES-FERDINAND WAL SIN ESTERHÁZY** (b. 1847, Austria—d. May 21, 1923, Harpenden, Hertfordshire, Eng.), French army officer, a major figure in the Dreyfus case.

Esterhazy had posed as a count and served in the Austrian army during the 1866 war with Prussia. He then served in the French Foreign Legion before being commissioned in the regular French army (1892).

Having fallen deeply into debt, Esterhazy apparently sold French military secrets to Germany. When Alfred Dreyfus was convicted (1894) of betraying military information to Germany, Esterhazy came under the suspicion of Lieutenant Colonel Georges Picquart, head of the French army's "statistical section" (the cover name for the army's counterintelligence unit), who recognized Esterhazy's handwrit-

ing on the treasonable document attributed to Dreyfus. Esterhazy was brought before a court-martial in 1897 and acquitted by his fellow officers, but the movement for revision of Dreyfus' conviction continued to gain supporters (including many French intellectuals). Esterhazy, in panic, fled to Belgium and then to London. Esterhazy's own accounts of his activity included one that he had indeed been a spy for Germany. In England, he worked as a translator and writer under the pseudonym "Comte de Voilemont" and may have worked as a traveling salesman.

Estes Park, town, Larimer county, north-central Colorado, U.S. The original town site lies in a large natural meadow (locally called a park) surrounded by a mixed coniferous-deciduous forest. It is situated in the Front Range of the Rocky Mountains, at an elevation of 7,522 feet (2,293 metres), on Big Thompson River. It is the eastern entrance

Estes Park, Colo.
Kris Hazelton/The Estes Park NEWS

and headquarters of Rocky Mountain National Park, and Roosevelt National Forest adjoins the town on the north, east, and south. Named for Joel Estes, the first settler (1859), the town is a centre of tourism and a year-round resort. It is also the engineering headquarters for the Colorado-Big Thompson Project that diverts water for irrigation and power generation. Trail Ridge Road, the highest continuous highway in the United States, extends west from Estes Park across the Continental Divide and then south to Grand Lake. An aerial tramway ascends Prospect Mountain, providing passengers with a superb view of the Divide. The Hidden Valley Ski Area is nearby. Inc. 1917. Pop. (2000) 5,413.

Estevan, city, southeastern Saskatchewan, Canada. It lies along the Souris River at the river's junction with Long Creek, just north of the North Dakota (U.S.) border, 125 miles (201 km) southeast of Regina. It was settled in 1892 with the arrival of the Canadian Pacific Railway, and its name is said to be an acronym of *George Stephen* and *William van Horne*, railroad developers. Estevan is mainly an agricultural service centre, with abundant supplies of lignite coal, clay, oil, and natural gas that have given the city a twofold orientation—mixed-farming and mineral extraction. The city is a port of entry from the United States, an administrative headquarters for the oil industry, and a manufacturer of coal briquettes and other products. Extensive tree nurseries line the riverbanks. Boundary Dam, just south of the city, impounds Long Creek for irrigation and flood control. Inc. village, 1899; town, 1906; city, 1957. Pop. (2001) 10,242.

Esther, Book of, Old Testament book that belongs to the third section of the Judaic biblical canon, known as the Ketuvim, or "Writings." In the Jewish Bible, Esther follows Ecclesiastes and Lamentations and is read on

the festival of Purim (*q.v.*), which commemorates the rescue of the Jews from Haman's plottings. The Book of Esther is one of the Megillot, five scrolls read on stated Jewish religious holidays. Esther appears between Nehemiah and Job in the Protestant canon. In the Roman Catholic canon, Esther appears between Judith and Job and includes six chapters that are considered apocryphal in the Jewish and Protestant traditions.

The book purports to explain how the feast of Purim came to be celebrated by the Jews. Esther, the beautiful Jewish wife of the Persian king Ahasuerus (Xerxes I), and her cousin Mordecai persuade the king to retract an order for the general annihilation of Jews throughout the empire. The massacre had been plotted by the king's chief minister, Haman, and the date decided by casting lots (*purim*). Instead, Haman was hanged on the gallows he built for Mordecai; and on the day planned for their annihilation, the Jews destroyed their enemies. According to the Book of Esther, the feast of Purim was established to celebrate that day, but this explanation is surely legendary. There is nothing close to a consensus, however, as to what historical event provided the basis for the story. The book may have been composed as late as the first half of the 2nd century BC, though the origin of the Purim festival could date to the Babylonian exile (6th century BC).

The secular character of the Book of Esther (the divine name is never mentioned) and its strong nationalistic overtones made its admission into the biblical canon highly questionable for both Jews and Christians. Apparently in response to the conspicuous absence of any reference to God in the book, the redactors (editors) of its Greek translation in the Septuagint interspersed many additional verses throughout the text that demonstrate Esther's and Mordecai's religious devotion. These so-called Additions to the Book of Esther do not appear in the Hebrew Bible, are treated as canonical in Roman Catholic Bibles, and are placed in the Apocrypha in Protestant Bibles.

Estherville, city, seat (1859) of Emmet county, northern Iowa, U.S. The city lies along the West Fork Des Moines River, 90 miles (145 km) northwest of Fort Dodge. The site was settled in 1857 shortly after the nearby Spirit Lake Massacre of settlers by the Sioux, and it was named for Esther Ridley, wife of one of the community's planners. Fort Defiance (1862), built as a protection against the Sioux, is commemorated in a state park just to the southwest. A large meteorite exploded over the area on May 10, 1879; several museums worldwide display its fragments, the largest of which is at the University of Minnesota, Minneapolis. The railroad reached Estherville in 1882, spurring the town's growth. The city is a trade and shipping centre with an agriculture-based economy. It is a gateway to the Iowa Great Lakes resort area. Inc. town, 1881; city, 1894. Pop. (2000) 6,656.

esthetic, esthetics, etc.: see under aesthetic, aesthetics, etc.

Estienne, Henri II, Estienne also spelled ÉTIENNE, Latin STEPHANUS (b. 1528, Paris, France—d. 1598, Lyon), scholar-printer, grandson of Henri Estienne, founder of the family printing firm in Paris, and son of Robert I Estienne, who left Paris to establish a printing firm in Geneva.

Educated in classical literature, Estienne traveled as a young man in Italy, England, and Flanders, studying ancient manuscripts and visiting scholars before joining his father in Geneva. There he began by publishing the results of his own researches in the first printed editions of several ancient Greek texts. In 1559 he succeeded to ownership of the press at Geneva.

In 1566 Estienne published a Latin edition of Herodotus, with an apologia accompanied by

a French version. This "Apologie pour Hérodote," perhaps Estienne's most famous work, caused Estienne trouble in Geneva. Ostensibly designed to show how the strange stories in Herodotus are paralleled by equally strange ones in modern times, it is bitterly satirical of his own age. Some passages were most objectionable to Genevan churchmen, and Estienne was arrested and tried and was obliged to cancel the offending pages. Even so, the book went through 12 editions in 16 years.

In classical scholarship Estienne's output continued to be voluminous: his Greek and Latin text of Plutarch, 13 vol. (1572), is an example. His greatest work was his Greek dictionary, *Thesaurus graecae linguae*, 5 vol. (1572), a masterpiece and a monument of lexicography that appeared in new editions as late as the 19th century.

In 1578 Estienne published a defense of pure French against Italianizing innovations; again Genevan authorities were displeased. Thereafter he spent a year in France, where he was well received by King Henry III, and his new book in praise of the French language was printed in Paris in 1579.

Estienne returned to Geneva in 1580, but after 1583 he spent much time away from his home, wandering from city to city in search of a congenial patron. The later publications of his press thus suffered to some extent from neglect. He died on a visit to France.

Estienne, Robert I, Estienne also spelled ÉTIENNE, Latin STEPHANUS (b. 1503, Paris, France—d. Sept. 7, 1559, Geneva, Switz.), scholar-printer, second son of Henri Estienne, who founded the family printing firm about 1502 in Paris.

Robert became head of the firm in 1526, and it was he who adopted the device of the olive tree for his title pages. In 1527–28 he published his first complete Bible in Latin, and in 1531 he completed his great *Dictionarium seu linguae latinae thesaurus*, a Latin dictionary that marks an epoch in the history of lexicography, not only for Latin but also for all other languages. Francis I of France made him king's printer for Hebrew and Latin works in 1539; in 1540 he became de facto king's printer also for Greek. He was commissioned in 1541 to supply the king's library with books printed in the Greek type of Claude Garamond. He prepared the first printed editions of many works by ancient Greek and Roman authors. Among his Latin editions, his Virgil of 1532 is noteworthy. He also published grammars and other educational texts.

The hostility of theologians at the Sorbonne forced Estienne to leave Paris for Geneva in

Title page to the *Biblia*, showing olive-tree motif adopted as Estienne family emblem, 1532

By courtesy of the Trustees of the British Library photograph, J.R. Freeman & Co. Ltd.

1551. His younger brother Charles (d. c. 1564), better known as a writer, succeeded to control of the family press at Paris. Works printed by Robert Estienne in Geneva include a Greek New Testament (1551), in which the present division of the text into verses occurs for the first time.

Estonia, officially REPUBLIC OF ESTONIA, Estonian EESTI, or EESTI VABARIK, country in northeastern Europe. It consists of a mainland area and some 1,500 islands and islets in the Baltic Sea. Estonia is bounded on the north by the Gulf of Finland (an inlet of the Baltic Sea), on the east by Russia, on the south by Latvia, and on the west by the Baltic Sea. The capital is Tallinn. Area 17,462 square miles (45,227 square km). Pop. (2002 est.) 1,359,000.

A brief treatment of Estonia follows. For full treatment, see MACROPAEDIA: Baltic States.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

Estonia

Physical and human geography. The Estonian landscape bears extensive traces of Pleistocene glacial activity (dating from 1,600,000 to 10,000 years ago). The south is covered with morainal hills, and the central part abounds in elongated glacial hills with flat tops. There are numerous lakes and forests and many rivers, most draining northward into the Gulf of Finland, others flowing eastward into Lake Peipus, and a few emptying westward into the Gulf of Riga. Low-lying areas are subject to waterlogging. Some two-fifths of Estonia is covered by forest. Estonia has a cool-temperate and humid climate that is generally favourable to agriculture, with moderately cold winters and mild summers. Annual precipitation is evenly distributed and ranges from 24 to 28 inches (610 to 710 mm).

Estonians, who speak a language belonging to the Finno-Ugric branch of the Uralic language family, constitute nearly two-thirds of the population. There are Russian, Ukrainian, Finnish, and Belarusian minorities.

Estonia's economy is mainly industrial, but agriculture is important. Cattle and pigs and forage crops dominate agriculture. Potatoes, grains, vegetables, plums, and strawberries are also grown. The land is difficult to farm because of the large glacial stones that have to be removed from the fields and because of the need to drain most of the natural pastures. Estonia's agriculture was collectivized at the end of World War II, but privatization proceeded quickly in the 1990s. The service industry expanded in the late 20th century.

Woodworking is a traditional and important industry, though excessive exploitation of Estonia's forest resources has threatened the industry. Reforestation has begun, but the woodworking industry still must import some of its raw timber. Forest products include paper, pulp, plywood, matches, and furniture.

Estonia's most important mineral resource is

oil shale, but only a small percentage of the country's workers are employed in its production and processing. Reserves and production of peat are also substantial, and there are large deposits of high-quality phosphorites, limestone, dolomites, marl, and clay.

The country's shale-processing industry produces fuel gas, which is an important source for the thermal production of electric power used both domestically and exported to neighbouring states. A chemical industry relying on shale processing produces benzene, adhesives, tanning agents, resins, formaldehyde, and detergents. The country also produces machinery, fabricated metal products, and building materials. Estonia is noted for its textiles, especially cotton cloth.

Estonia's government centres on the single-chamber Riigikogu (Parliament), the 101 members of which are elected through proportional representation to four-year terms. The Riigikogu selects both the president and the prime minister.

Education in Estonia is free and compulsory through the completion of the 9th grade, and higher education is provided at public and private institutions. The country has an extensive system of social-welfare support for the ill and disabled. Tallinn has an opera house and a variety of theatres and is also famous for its song festivals featuring thousands of singers.

History. Estonians are first mentioned by the Roman historian Tacitus in his *Germania* (1st century AD). The region was invaded by Vikings in the 9th century and later by Danes, Swedes, and Russians, but in general the Estonians were able to withstand the assaults until the 13th century. In 1346 the Danish crown, which possessed northern Estonia and the islands, sold its sovereignty to the Teutonic Order (an organization of German crusaders), which was then in possession of Livonia (southern Estonia and Latvia), and German conquest was complete. In the mid-16th century, on the dissolution of the Teutonic Order, Estonia was once again divided, with northern Estonia capitulating to Sweden, and Poland gaining Livonia. By the Truce of Altmark (1629), Poland surrendered most of Livonia to Sweden. Early in the 18th century, Peter I the Great of Russia defeated Charles XII of Sweden, and, by the Peace of Nystad (1721), acquired Livonia and Estonia. Nearly a century later, reforms of property ownership were undertaken and serfdom was abolished. With the accession of Russian emperor Alexander III (1881), however, Estonia began to undergo intensive Russification.

In 1918 Estonia obtained independence from Russia. Independent Estonia had democratically elected coalition governments from 1919 to 1933 and dictatorial rule thereafter until the Soviet Union occupied the country in 1940. Estonia was forcibly incorporated into the U.S.S.R. that same year. Germany briefly held the region during World War II, but the Soviet regime was restored in 1944, after which Estonia's economy was collectivized and integrated into that of the Soviet Union. Estonia declared its independence from the Soviet Union in August 1991, instituted a new constitution in July 1992, and held the first elections to the Riigikogu in September 1992. Post-Soviet administrations—such as that of Prime Minister Siim Kallas, appointed in 2002—moved Estonia toward a market economy and established closer ties with the West.

Estonian language, Estonian EESTI, member of the Finno-Ugric branch of the Uralic language family, spoken in Estonia and in scattered pockets in surrounding regions. The language occurs in two major dialectal forms, northern and southern; the northern, or Tallinn, dialect is the basis of the Estonian literary language. The first notable written materials in Estonian are the Kullamaa prayers of the 1520s.

Estonian belongs to the Baltic-Finnic branch of the Finno-Ugric languages, and it is most closely related to Finnish, Votic, Livonian, Ingrian, Karelian, and Veps. In structure the language is best known for its unusual contrast of three degrees of consonant and vowel length—e.g., *koli* 'junk' (with short *o*), *kooli* 'of school' (with long *o*), and *kooli* 'to school' (pronounced with an extra long *o* although spelled the same as the preceding form). Estonian also has the characteristic Baltic-Finnic consonant gradation, in which consonants alternate in certain contexts, but it has lost the feature of vowel harmony. (Vowel harmony is said to exist when certain vowels cannot occur with other specific vowels within a word.) Estonian, like the other Uralic languages, primarily marks grammatical categories by the addition of suffixes to the stem. Much of the Estonian vocabulary has been borrowed from German. See also Finno-Ugric languages.

Estonian literature, body of writings in the Estonian language. The consecutive domination of Estonia from the 13th century to 1918 by Germany, Sweden, and Russia resulted in few early literary works in the vernacular. Writings in Estonian became significant only in the 19th century. Moreover, many writers went into exile in World War II, which led to a large body of postwar exile literature.

Early written Estonian is strongly Germanic, and the first known book in Estonian is a translation of the Lutheran catechism (1535). The New Testament was translated into southern Estonian in 1686 (northern Estonian, 1715); in his translation of the Bible (1739), Anton Thor Helle united the two dialects based on northern Estonian.

The strongest genre of Estonian literature is lyric poetry, owing to the influence of the folk poetry that flowered from the 14th century to the 17th. Though it includes variants of Finnish epic themes, it is more lyrical than Finnish folk poetry. More than a million pages of folk poems of several ethnic groups are preserved in the national archives at Tartu; some are published in *Vana kannel*, 3 vol. (1875–1938), and *Seukeste laulud*, 3 vol. (1904–07; "Songs of the Setus," the peoples of southeastern Estonia). As in Finnish folk poetry, the staple metre of Estonian is the trochaic four-foot line; assonance, alliteration, repetition, and parallelism predominate.

Written literature began in the so-called Estophile period (c. 1750–1840) with moral tales and manuals written by Balto-German enthusiasts for the native language and culture. The philological journal *Beiträge zur Genauern Kenntniss der ehstnischen Sprache* ("Contributions to a Better Understanding of the Estonian Language") contained examples of folk poetry and essays, including work by the first native Estonian poet, Kristjan Jaak Peterson. More significant for literature was an epic, *Kalevipoeg* (1857–61; "The Son of Kalevi [or Kalev]," translated as *Kalevipoeg: An Ancient Estonian Tale*) that was part authentic tradition and part a creation of F.R. Kreutzwald, for this inspired the Romantic nationalist movement soon to emerge. Popular patriotic Romantics were the poets Lydia Koidula and Anna Haava, and the first novelist was Juhan Sommer, whose book *Luige Laus* appeared in 1843. The first Estonian historical novel was Eduard Bornhöhe's *Tasuja* (1880; "The Avenger"). Jakob Pärn's *Oma tuba, oma lüba* ("Own House, Own Master") approached the realistic style fully developed in the later work of Juhan Liiv.

The realism epitomized in Liiv's writings held sway from 1890 to 1906. It was superseded by the Neoromantic Young Estonia group, whose leader, the poet Gustav Suits, devised the slogan "More European culture! Be Estonians but remain Europeans!" For Suits and his followers this meant greater attention to form. With the Russian Revolution

of 1917 emerged the Siuru group (named after a bird in Finno-Ugrian mythology). These Neoromantic poets reacted against Suits's emphasis on formalism. Their emotional intensity was well-illustrated by Henrik Visnapuu, who, with Marie Under, developed the lyrical potential of Estonian to the full. By the 1930s a renewal of realism brought poetry closer to life, but the only outstanding poetry of this revival was descriptions of modern urban life in the work of Juhan Sütiste (Schütz). The Arbudaj group (which also took its name from a word with origins in mythology) of the mid-1930s, on the other hand, stressed intellectual and aesthetic aspects of literature. Leading poets were Betti Alver, whose skillful use of symbolic imagery was shown in *Tolm ja tuli* (1936; "Dust and Fire"); Heiti Talvik, who in *Kohtupäev* (1937; "Doomsday") predicted the coming holocaust; Uku Masing, a religious mystical poet; and Bernard Kangro, later the leading lyrical poet in exile.

After World War II more than half of Estonia's writers went into exile, and their poetry reflected either pessimism, like Kangro, or longing for Estonia, as in Visnapuu's exile poetry. Gradually a new generation of ironic poets emerged, best-exemplified by Kalju Lepik, experimental author of *Kollased nõmmed* (1965; "Yellow Heaths"); a skeptical poet, Arno Vihalemm, whose work was spiced with self-irony; and the author of the epic *Peetri kiriku kellad* ("The Bells of St. Peter's"); Ivar Grünthal. In Estonia little poetry appeared under Stalin's Socialist Realism, but new poets, adopting Western styles, appeared in the 1960s. Among these were Jaan Kross, Ellen Niit, Ain Kaalep, and Mats Traat.

Prose writing was equally influenced by movements current in Europe. The realism of the beginning of the century was exemplified in the social criticism of Liiv's *Kümme lugu* (1893; "Ten Tales") and in Ernst Peterson's criticism of social injustice, *Boils* (1899-1901). An outstanding realist novelist was Eduard Vilde, who wrote a historical trilogy attacking the Balto-Germanic feudal system and in *Mäeküla piimamees* (1916; "The Dairyman of Mäeküla") again treated the relationship between landowner and serf. Friedebert Tuglas, who introduced Impressionism and Symbolism, belonged to Young Estonia, while August Gailit was a leading Siuru prose writer. Among the Neoromantics who became realists were Anton Tammsaare, who wrote an ethico-psychological chronicle, *Tõde ja õigus* (1926-33; "Truth and Right"), and Albert Kivikas, whose *Nimed marmortahvlil* (1936; "Names on the Marble Tablet") was about the war of liberation.

Novelists in exile found inspiration in the very fact of their exile. Two principal themes were wartime experiences and the problem of adapting to new environments. Among writers in exile were Gailit, Mälk, Kivikas, Ristikivi, Pedro Krusten, Karl Rumor, Juhan Jaik, Evald Mänd, and Valev Uibopuu. New writers included a critic, essayist, and dramatist, Arvo Mägi, and the novelists Ilmar Talve, Ilmar Jaks, Helga Nõu, and Elin Toona. Of these, the last three showed an increasing internationalism in their work. In Estonia post-war fiction decayed in the way poetry did. The deadening effect of Socialist Realism gradually gave way to greater subtlety, and younger novelists, such as Arvo Valton, Enn Vetemaa, and Mati Unt, were able to examine some of the problems of Communism and begin stylistic experimentation.

Dramatic works were few, but two early playwrights stood out: August Kittsborg, author of both comedies and serious plays, and Hugo Raudsepp, whose realistic and symbolical plays were social satires.

Estoril, fashionable resort, Lisboa *distrito* ("district"), Portugal. It is located on the Cascais Bay (the Portuguese Riviera) of the Atlantic Ocean, 15.5 miles (25 km) west of Lisbon. Tourism is the economic mainstay of the town, which is both a summer and winter resort. Its chief feature is the magnificent avenue of palm trees leading from the seaford to the Casino Internacional. The nearby Estoril Hill (358 feet [109 m]) is noted for its trees, especially pines, eucalyptus, and palms. Pop. (1981) town, 3,776; (1991) town with adjacent *freguesia* (parish), 24,800.

Estournelles de Constant, Paul-H(enri)-B(enjamin) d', original name PAUL-HENRI-BENJAMIN BALLUAT, BARON DE CONSTANT DE RÉBECQUE D'ESTOURNELLES (b. Nov. 22, 1852, La Flèche, Fr.—d. May 15, 1924, Paris), French diplomat and parliamentarian who devoted most of his life to the cause of international cooperation and in 1909 was cowinner (with Auguste-Marie-François Beermaert) of the Nobel Prize for Peace.

In the French diplomatic service he reached the rank of minister plenipotentiary. Later he entered politics and was elected deputy for the Sarthe *département* in 1895 and reelected in 1898 and 1902. From 1904 he sat in the Senate and was reelected in 1909 and 1920. He took an active part in the interparliamentary international conferences that began in 1889 and was a member of the French delegation to the Hague peace conference of 1899, which led to the formation of the Permanent Court of Arbitration at The Hague. When that court seemed likely to be ignored by governments, he persuaded President Theodore Roosevelt to submit to it a minor dispute between the United States and Mexico in September 1902. This example was then followed by other governments.

In 1905 he set up in Paris the Association for International Conciliation, with branches in a number of other countries. He was active in securing the summoning of the second Hague conference in 1907. His contribution to internationalism arose in large part from his work as propagandist and organizer. Among his publications are *La Politique française en Tunisie* (1891); *La Conciliation internationale* (1906); *Le Rapprochement franco-allemand* (1909); *Pour l'aviation*, 2nd ed. (1909); *Les États-Unis d'Amérique* (1913; *America and Her Problems*); and *Pour la Société des Nations* (1921).

Estrada Cabrera, Manuel (b. Nov. 21, 1857, Quezaltenango, Guatemala—d. Sept. 24, 1924, Guatemala City), jurist and politician who became dictator and ruled Guatemala for the first two decades of the 20th century through a standing army, secret police, and systematic oppression.

After a church-directed education, he practiced law for a time in Guatemala City and was appointed a judge on the Supreme Court. He then entered politics, was elected to the Congress, and served successively as minister of public instruction, of justice, and of the interior. When President José María Reina Barrios was assassinated in 1898, Estrada Cabrera was appointed provisional president and then elected president. He served his first term respecting the constitution but then had it changed in order to ensure his repeated "reelections."

Estrada Cabrera's strong rule gave Guatemala internal peace and some economic improvement. He attracted investment in the nation by the United Fruit Company, built a few schools, increased agricultural production, and improved sanitation. At the same time, he plundered the treasury, kept the Indians in a state of peonage, and extinguished the few political liberties the Guatemalans had won in previous years. Finally, an armed revolt in 1920 led to his downfall. Stripped of his plundered fortune, he died ignominiously in jail.

Estrada Palma, Tomás (b. July 9, 1835, near Bayamo, Cuba—d. Nov. 14, 1908, Oriente province), first president of Cuba, whose administration was noted for its sound fiscal policies and progress in education.

As a general in the revolutionary army, Estrada Palma served during the Ten Years' War (1868-78) against Spain and became president of the provisional government in 1875. He was captured by the Spanish in 1877. Upon his release he moved to Orange County, New York, to become principal of the Central Valley School for Boys. From that base he led the Cuban junta in New York City and later, on the death of José Martí, became the actual head of the revolution.

After the Spanish-American War (1898) the United States turned the island over to the Cubans (1902), and Estrada Palma became president. He had aligned himself with no party, nor had he campaigned for the position, returning to Cuba only after the election. In the 1905 election Estrada Palma was forced by the need for the cooperation of Congress to align himself with a political party—the Conservatives (later known as the Moderates). The opposition Liberals accused the Conservatives of using fraudulent means to win the election, and the revolution of 1906 followed. Estrada Palma resigned in September, and the United States intervened, taking temporary control.

Estrades, Godefroi (-Louis), comte d' (count of) (b. 1607, Agen, Fr.—d. Feb. 26, 1686, Paris), marshal of France and one of Louis XIV's ablest diplomats.

Estrades served with distinction in the Low Countries during the Thirty Years' War, conducted a famous defense of Dunkirk (1651-52), and took part in later campaigns in Catalonia (1655), Italy (1657), and Holland (1672). He was mayor *perpétuel* of Bordeaux (to which the title of count was attached) from 1653 to 1674 and was made chevalier de l'Ordre du Saint Esprit in 1661 and marshal of France in 1675. Having been ambassador extraordinary to Holland (1646) and a participant in the conferences at Münster, he went as ambassador to London in 1661; the attempt of the Spanish ambassador there to have precedence over him led to a great triumph for France; and in 1662 he negotiated the purchase from England of Dunkirk, of which he became governor. He was again ambassador to Holland from 1663 to 1668 and also represented the French in the negotiations at Breda in 1667 and at Nijmegen from 1675 to 1678.

estragon (herb): *see* tarragon.

Estrangela, also spelled ESTRANGELO, an early form of Syriac writing that was in almost exclusive use until about AD 500. *See* Syriac alphabet.

Estrées, Gabrielle d', DUCHESSE (duchess) DE BEAUFORT, DUCHESSE D'ÉTAMPES (b. 1573—d. April 10, 1599, Paris), mistress of King Henry IV of France and, with him, founder of the Vendôme branch of the House of Bourbon.

The daughter of the Marquis de Coeuvres, Gabrielle met Roger de Saint-Lary, later Duke de Bellegarde, at the court of Henry III and became his mistress. Saint-Lary in turn introduced her to Henry IV, who fell in love with her; it was probably during Henry's siege of Chartres (1591) that she became his mistress. Henry arranged a purely formal marriage for her with Nicolas d'Amerval (June 1592; annulled 1594), but this formality did not prevent him from publicly acknowledging her as his mistress in December 1592. Indeed, Henry was often accused of compromising his victories in order to visit her. She had his entire confidence and influenced him in his

decision to become a Roman Catholic in the expectation that the pope would then annul his marriage to Queen Margaret.

Surrounded by a rapacious entourage, Gabrielle showed herself neither disinterested nor faithful. She bore the king three children, who were legitimized: César, Duke de Vendôme; Catherine-Henriette, Duchess d'Elbeuf; and Alexandre, Chevalier de Vendôme, later grand prior of France. In 1595, when César was legitimized, Gabrielle was made Marquise de Monceaux; later she was made Duchess de Beaufort (1597) and Duchess d'Étampes (1598). By this time Henry was master of all France. He seriously considered marrying her, despite the opposition of the Holy See and the Duke de Sully, whose protector she had been. Henry considered her to be his wife, and she looked on herself as queen of France, but she died suddenly, before any definite steps toward marriage were taken.

Estrela Mountains, Portuguese *SERRA DA ESTRELA*, highest mountains of Portugal. The range lies in the north-central part of the country, between the basins of the Tagus and Mondego rivers. The western continuation of the Central Sierras (Sistema Central) of Spain, the range runs about 40 miles (65 km) from northeast to southwest and is between 10 and 15 miles (16 and 24 km) wide. The highest point is the Malhão da Estrela (6,539 feet [1,993 m]). With an annual rainfall of more than 90 inches (2,300 mm) above 4,000 feet (about 1,200 m), the range is one of Portugal's chief pastoral districts, the seasonal herding of sheep and goats still being practiced there. Wildlife includes wild goat, deer, fox, and wild boar. Tin, titanium, and tungsten are mined in the mountains. Winter sports, including skiing, account for a small tourist trade.

Estremadura, historic coastal province of central Portugal that contained Lisbon and the Tagus River estuary. The landforms of Estremadura are geologically younger than other parts of the Iberian Peninsula, containing sandstone, limestone, and volcanic rock instead of granite and schist. The peninsulas of Lisbon and Setúbal are divided by the lower Tagus River valley. Land use north of the Tagus is diverse. Vineyards, olive groves, and cereal plots are found on the hilly slopes, and the Cartaxo and Torres areas are known for their wines. South of the Tagus the landscape is less tamed; much is still unproductive or in extensive estates of cork oak forest. Along the Tagus valley corn (maize), grapes, rice, and wheat are cultivated, and some of Portugal's finest horses and fighting bulls, both used in the Portuguese bullfights, are raised there. The Quinta da Terra (Pinheiro de Loures) is a provincial bullfighting museum.

Known as the Portuguese Riviera, the coastal region west of the city of Lisbon has important resort centres, including Estoril, Cascais, and Sintra. Apart from Lisbon, other chief towns include Setúbal, the main sardine port, with canneries; Bareiro and Almada, suburbs of Lisbon; and the fishing towns of Peniche and Nazaré.

Estremadura (Spain): see Extremadura.

Estremoz, city and *concelho* (township), Évora *distrito* ("district"), eastern Portugal. An ancient, gated city, it is overlooked by a 13th-century castle, in which St. Isabella of Portugal, widow of King Dinis, died in 1336. Estremoz was an important base for the Portuguese army in its successful battles against the Spanish during the 17th century. It is renowned for its distinctive pottery. Local produce includes wine and olive oil; there are cork-processing and wool-milling industries, and white marble is quarried in the neighbourhood. Pop. (1991 prelim.) city, 6,910; *concelho*, 18,480.

Estrildidae, songbird family, order Passeriformes, consisting of about 130 species of waxbills and other small finchlike birds of the Old World, many of which are favourite cage birds.

Members range in size from 7.5 to 15 cm (3 to 6 inches) long. They have short, stout bills and short legs and display a wide variety of colours and patterns. These gregarious ground feeders search for seeds, berries, and insects. Waxbills are poor singers, their songs being interspersed with chirps, buzzes, and chatters; but their bright colours, liveliness, and adaptability recommend them to bird fanciers. The family's members include mannikins and munias (*Lonchura*), cordon bleus and grenadiers (*Uraeginthus*), fire finches (*Lagonosticta*), waxbills (*Estrilda*), parrot finches (*Erythrura*), and negro finches (*Nigrita*).

Black-headed munia, or chestnut mannikin (*Lonchura malacca*), a member of the Estrildidae family
Eric and David Hosking

The waxbills are sometimes listed as a subfamily (Estrildinae) in the weaverfinch family (Ploceidae). The Estrildidae family belongs to the songbird suborder (Passeres).

estrogen, any of a group of hormones that primarily influence the female reproductive tract in its development, maturation, and function. There are three major hormones—estradiol, estrone, and estriol—among the estrogens, estradiol being the predominant one. The major sources of estrogens are the ovaries and the placenta (the temporary organ that serves to nourish the fetus and remove its wastes); additional small amounts are secreted by the adrenal glands and by the male testes. It is believed that the egg follicle (the saclike structure that holds the immature egg) and interstitial cells (certain cells in the framework of connective tissue) in the ovary are the actual production sites of estrogens in the female. Estrogen levels in the bloodstream seem to be highest during the egg-releasing period (ovulation) and after menstruation, when tissue called the corpus luteum replaces the empty egg follicle.

Estrogens affect the ovaries, vagina, fallopian tubes, uterus, and mammary glands. In the ovaries, estrogens help to stimulate the growth of the egg follicle; they also stimulate the pituitary gland in the brain to release hormones that assist in follicular development. Once the egg is released, it travels through the fallopian tubes on its way to the uterus; in the fallopian tubes estrogens are responsible for developing a thick muscular wall and for the contractions that transport the egg and sperm cells. The young female uterus, if deprived of estrogens, does not develop into its adult form; the adult uterus that does not receive estrogens begins to show tissue degeneration. Estrogens essentially build and maintain the endometrium—a mucous membrane that lines the uterus; they increase the endometrium's size and weight, cell number, cell types, blood flow, protein content, and enzyme activity. Estrogens also stimulate the muscles in the uterus to develop

and contract; contractions are important in helping the wall to slough off dead tissue during menstruation and during the delivery of a child and of the placenta. The cervix, the tip of the uterus, which projects into the vagina, secretes mucus that enhances sperm transport; estrogens are thought to regulate the flow and thickness of the mucous secretions. The growth of the vagina to its adult size, the thickening of the vaginal wall, and the increase in vaginal acidity that reduces bacterial infections are also correlated to estrogen activities.

In the breasts the actions of estrogens are complexly interrelated with those of other hormones, and their total significance is not easily defined; they are, however, responsible for growth of the breasts during adolescence, pigmentation of the nipples, and the eventual cessation of the flow of milk.

Estrogens also influence the structural differences between the male and female bodies. Usually the female bones are smaller and shorter, the pelvis is broader, and the shoulders are narrower. The female body is more curved and contoured because of fatty tissue that covers the muscles, breasts, buttocks, hips, and thighs. The body hair is finer and less pronounced, and the scalp hair is usually more permanent. The voice box is smaller and the vocal cords shorter, giving a higher-pitched voice in females than in males. In addition, estrogens suppress the activity of sebaceous (oil-producing) glands and thereby reduce the likelihood of acne in the female. In experimental animals, loss of estrogens diminishes the mating desires and other sexual behaviour patterns.

In the male, traces of estrogens are present in the blood and urine; estrogens seem to be most evident in the male during puberty and old age. Their function in the male and their interplay with the male hormones are not completely known.

Estrup, Jacob Brønnum Scavenius (b. April 16, 1825, Sorø, Den.—d. Dec. 24, 1913, Copenhagen), statesman and Conservative prime minister of Denmark from 1875 to 1894.

In 1864 Estrup entered the Landsting (upper chamber) as a member of the National Landowners' Party. As minister of the interior from 1865, he made major improvements in the railways and in Esbjerg harbour. He influenced the writing of the new constitution of

Estrup, detail from an oil painting by August Gerndorff, 1895

By courtesy of the Nationalhistoriske Museum paa Frederiksborg, Denmark

July 1866, which gave landowners extensive power in the Landsting. Estrup then became the leader of a powerful group in the Landsting. In 1875, backed by the majority and by the king, Christian IX, he became prime minister and formed a government. The right demanded large appropriations for defense, but the Folketing (lower chamber) rejected Estrup's motion on fortifications. His government was able to maintain itself in power by letting the king declare a provisional budget. The Liberals considered the measures uncon-

stitutional; Estrup counteracted public unrest with police action and a stricter penal code.

Faced with a strong Conservative Party, the Liberal Party broke into factions. Thereafter the Conservatives, under Estrup's leadership, controlled the government for nearly two decades. He carried through some social reforms with the help of the moderate Liberals, whose majority also supported the Financial Act of April 1894; this act contained grants for temporary military installations but repealed Estrup's earlier police and press measures. After Estrup resigned in 1894, he remained a prominent critic of the Liberal governments.

estrus, also spelled OESTRUS, the period in the sexual cycle of female mammals, except the higher primates, during which they are in heat—*i.e.*, ready to accept a male and to mate. One or more periods of estrus may occur during the breeding season of a species. Prior to ovulation the endometrium (uterine lining) thickens, in preparation for holding the fertilized ova. As the proliferation of uterine tissue reaches its peak, receptivity is highest—this is the estrous period. Some animals (*e.g.*, dogs) are monestrous, having only one heat during a breeding season. Others (*e.g.*, ground squirrels) are polyestrous: if not impregnated, they will come into heat repeatedly during the breeding season. Males can recognize a female in heat by smell; certain substances (pheromones) are secreted only at this portion of her cycle. The female's genital area may be swollen during estrus, and she may show by a variety of behavioral signals that she is ready to mate.

estuary, partly enclosed coastal body of water in which river water is mixed with seawater. In a general sense, the estuarine environment is defined by salinity boundaries rather than by geographic boundaries. Many coastal features that are designated by other names are in fact estuaries. For example, various coastal embayments, such as Chesapeake Bay and Galveston Bay, also are estuaries because fresh and salt water undergo considerable mixing. Moreover, most of the world's fjord systems are estuaries, as are large semienclosed tidal-flat regions and coastal marshes.

A brief treatment of estuaries follows. For full treatment, see MACROPAEDIA: Rivers.

Estuaries have long been important as harbour sites and centres of commerce. Some of the oldest continuous civilizations have flourished in such estuarine environments as the lower region of the Tigris and Euphrates rivers, the Po River delta region of Italy, the Nile delta, the Ganges delta, and the lower Huang Ho valley. Developing civilizations soon discovered that the logical site for commercial seaports was the seawardmost point of the major river systems. Such cities as London (Thames River), New York City (Hudson River), Montreal (St. Lawrence River), Hamburg (Elbe River), and Bordeaux (Gironde estuary) have developed on estuaries and have become important centres of commerce.

The geologic processes that form an estuary are extremely complex and varied, but it is clear that the existence of an estuary is largely dependent on the position of sea level relative to the freshwater discharge. If sea level were lowered, the estuarine zone would migrate seaward at the interface of the marine water and the edge of the newly exposed land area. Such migration has occurred in the past as a consequence of the Earth's several glaciations. For each glaciation, the primary source of moisture has been the oceans. Whenever sea level fell, the estuarine environment at the continental margin was forced to migrate in a seaward direction.

About 18,000 years ago the Wisconsin Glacial Stage attained its maximum, and glacial melting began. The seas rose, forcing the estuarine environment to migrate back up the continental shelf. During the period of lowered sea level, some rivers had become en-

trenched in the continental shelf and deepened their valleys, which were soon flooded by the rising marine waters, forming a typical drowned river estuary. In areas such as Norway and parts of the coast of British Columbia, Can., valley glaciers had deepened river valleys. These narrow drowned glacial valleys became the modern fjord estuaries as sea level rose.

The geomorphology (*i.e.*, form) of an estuarine basin is usually developed by one of three agents: (1) fluvial or glacial erosion, (2) fluvial and marine deposition, or (3) tectonic activity. The last of these involves the downfaulting of a coastal area or the broad local subsidence of a stretch of coastline, as in the case of San Francisco Bay (northern Calif.).

Esus (Celtic: "Lord," or "Master"), powerful Celtic deity, one of three mentioned by the Roman poet Lucan in the 1st century AD; the other two were Taranis ("Thunderer") and Teutates ("God of the People"). Esus' victims, according to later commentators, were sacrificed by being ritually stabbed and hung from trees. A relief from the Cathedral of Notre-Dame in Paris portrays him as a bent woodman cutting a branch from a willow tree. This and a related relief from Trier, Ger., associate him with the sacred bull and his accompanying cranes or egrets.

Eszék (Croatia): see Osijek.

Esztergom, German GRAN, Latin STRIGONIUM, Slovak OSTRIHOM, town, Komárom-Esztergom *megye* (county), northwestern Hungary. It is a river port on the Danube River (which at that point forms the frontier with Slovakia) and lies 25 miles (40 km) northwest of Budapest. The various forms of its name all refer to its importance as a grain market. It is at the western end of the valley cut by the Danube between the Pilis and Börzsöny hills, which divides the Little Alfold (Little Hungarian Plain) from the Great Alfold (Great Hungarian Plain).

Esztergom was the capital and royal residence of the early Árpád kings and successive Hungarian kings until the mid-13th century. Stephen I was born in the town and crowned there in 1000. The archbishopric, one of the oldest in Hungary and dating from 1189, moved to Trnava during the Turkish occupation (1543-1683), to return in 1820. Esztergom's fortress, last restored in the 18th century, is still largely intact atop Várhegy (Castle Hill). The town's great cathedral (built 1822-60), modeled on St. Peter's in Rome, overlooks the Danube and is the largest church in Hungary, the outside height of the cupola being 348 feet (106 m). It is on the site of St. Stephen's original cathedral (1010). The treasury of the cathedral has a rich collection of medieval goldsmiths' work and a textile collection. The former primate's palace, the Christian Museum, has a rich painting col-

Christian Museum with the dome-topped great cathedral and fortress of St. Stephen in the background, Esztergom, Hung.

ZEFA

lection. The Castle Museum has relics of the royal palace (10th-12th century, major period of construction). The town also has many fine Baroque houses. After World War II, industries producing machine tools, bricks and pottery, wine, and synthetic fibres were established in Esztergom. Pop. (2001) 29,452.

Eszterháza (Hungary): see Fertőd.

Eszterházy FAMILY: see Esterházy family.

eta (Japanese minority): see burakumin.

ETA, abbreviation of EUSKADI TA ASKATASUNA (Basque: "Basque Homeland and Liberty"), Basque separatist organization in Spain that adopted violent methods in its campaign for an independent Basque state.

ETA grew out of the Basque Nationalist Party (Partido Nacionalista Vasco; PNV), which had been founded in 1894 and which managed to survive, though illegally, under Francisco Franco's fascist regime by maintaining its headquarters in exile in Paris and keeping quietly out of sight in Spain. In 1959 some youthful members, angered at the party's persistent rejection of armed struggle, broke away and founded ETA. Within the next few years the new organization developed groupings associated increasingly with Marxist positions, setting revolutionary socialism as their end. In 1966, at ETA's fifth conference, the organization divided ideologically into two wings—the "nationalists," or ETA-V, who adhered to the traditional goal of Basque autonomy, and the "ideologists," or ETA-VI, who favoured a Marxist-Leninist brand of Basque independence and the use of public sabotage and, later (from 1968), assassination to achieve it. The Franco regime's attempts to crush ETA in the Basque provinces were severe, the police using arbitrary arrest, beatings, and torture. By 1969-70 the principal leaders had been rounded up by the police and subjected to military trials in the city of Burgos.

Factionalism continued to plague ETA in the 1970s and '80s, with various internal factions pursuing alternately violence and political action. After Franco's death in 1975, Spain's democratic governments moved to establish regional autonomy for the Basque provinces and to offer pardons to ETA members renouncing terrorism, but in the decade after Franco the number of ETA killings by bombing and assassination multiplied tenfold. Most of those assassinated were high-ranking Spanish military officers, judges, and government officials.

ETA came to rely financially on robberies, kidnappings, and "revolutionary taxes" extorted from businessmen. It formed political front organizations to contest elections in the post-Franco period while also continuing to engage in assassinations and car bombings to achieve its goals. Successive ETA leaders were captured by the Spanish government or killed in factional disputes, but the organization remained active.

In September 1998 ETA called a cease-fire, which lasted 14 months. But violence by ETA at the beginning of the 21st century once again led the Spanish government to attempt to suppress the organization. Despite this effort, ETA continued to carry out terrorist acts.

Eta Carinae, also called KEYHOLE NEBULA, peculiar red star and nebula (catalog number NGC 3372) in the southern constellation Carina. The English astronomer Sir Edmond Halley noted it in 1677 as a star of about fourth magnitude. In 1838 Sir John Herschel observed it as a first-magnitude star. By 1843 it had reached its greatest recorded brightness, approximately -1 magnitude, or as bright as the brightest stars. Unlike the common types of exploding stars called novae and super-

novae, it remained bright for several years. From about 1857 it faded steadily, disappearing to the unaided eye only about 1870. Since then it has varied irregularly about the seventh magnitude. The nebula around the star is an expanding shell of bright gas resembling a halo. It is thought that the star's consumption of its nuclear fuel may be accelerating and that Eta Carinae may be a supernova at some future time.

Etah, town, western Uttar Pradesh state, northern India, northeast of Agra. A marketplace for agricultural products, it has several colleges affiliated with Agra University. Etah lies in a section of alluvial plain on the Ganges River's southern bank. Irrigated by both the Upper and Lower Ganges canals, this region contains a fertile area between the river's present channel and its ancient bed to the southwest. Wheat, cotton, and sugarcane are grown. Kāsganj, north of Etah, is also an agricultural market and is a centre of cotton and sugar processing. Soron, farther north, is a Hindu pilgrimage centre. Pop. (1991) town, 78,424.

Étampes, city, Essonne *département*, Paris region, northern France. It lies along the Juine River, about 28 miles (45 km) south of Paris. The city in medieval times was a stronghold and preserves several architectural remnants of those times, including a 12th-century donjon, the tower of Guinette, several churches (Saint-Basile, Notre-Dame du Fort, Saint-Gil, and Saint-Martin), a town hall, and private houses. Étampes is a busy commercial centre set in a fertile countryside and has diversified industries, including metallurgy, food processing, and other manufactures. Pop. (1999) 21,800.

Étampes, Anne de Pisseleu, duchesse d' (duchess of) (b. 1508—d. c. 1580), mistress of King Francis I of France and the major supporter of the party of the Duke d'Orléans in opposition to that of the dauphin (the future Henry II).

The daughter of a nobleman of Picardy, she came to court before 1522 as maid of honour to Louise of Savoy, Duchess d'Angoulême and mother of Francis I. She first met Francis on his return from Spain in 1526 and soon became his mistress. In 1533 he married her to Jean de Brosses, governor of Brittany, whom he created Duke d'Étampes. Known for her wit and intellect as well as for her beauty, the Duchess d'Étampes was also ambitious. In competition with her rival, Diane de Poitiers, who was mistress to the dauphin, she supported the party of the Duke d'Orléans. Upset by the dauphin's military successes against Emperor Charles V, she tried to convince Francis to detain Charles, then visiting France, until a settlement was reached. Charles in his turn tried to win over the duchess, a circumstance that lent credence to the charge made against her in 1544 that she had betrayed plans to Charles before his attack on France. With the death of Francis in 1547 and the accession of Henry II, the Duchess d'Étampes was dismissed from court. She died in obscurity.

Étampes, Gabrielle d'Estrées, duchesse d' (duchess of): *see* Estrées, Gabrielle d'.

Etana Epic, ancient Mesopotamian tale concerned with the question of dynastic succession. In the beginning, according to the epic, there was no king on the earth; the gods thus set out to find one and apparently chose Etana, who proved to be an able ruler until he discovered that his wife, though pregnant, was unable to give birth, and thus he had no heir to the throne. The one known remedy was the birth plant, which Etana was required

to bring down personally from heaven. Etana, therefore, prayed to the god Shamash, who heard his request and directed him to a mountain where a maimed eagle, languishing in a pit (into which it had been thrown as punishment for breaking a sacred pact), would help him obtain the special plant. Etana rescued the eagle, and as a reward it carried him high up into the sky.

The result of Etana's quest is uncertain because of the incomplete state of the texts. According to one fragment, Etana reached heaven and prostrated himself before the gods. There the text breaks off. According to another fragment, however, Etana either became dizzy or lost his nerve before reaching heaven and crashed to the ground. If, as many scholars believe, Etana was successful, the myth may have been used to support early dynastic claims.

Etana of the myth is probably the Etana who ruled Kish in southern Mesopotamia sometime in the first half of the 3rd millennium BC, although there is no historical evidence laying claim to the exploits recorded in the epic.

Etawah, town, west-central Uttar Pradesh state, northern India. It lies along the Yamuna River, southeast of Agra. The town is crossed by numerous ravines, one of which separates the old city (south) from the new city (north); bridges and embankments connect the two. Etawah contains a 16th-century mosque, the Jāmi' Mosque, built on high ground from the ruins of old Hindu buildings. There is also a ruined 15th-century fort, surrounded by Hindu temples. The town has important cotton- and silk-weaving industries, contains oilseed mills, and is a distribution centre for ghee (clarified butter).

Etawah is situated in a stretch of alluvial plain drained by the Yamuna and its tributaries and irrigated by a branch of the Ganges Canal system. Crops include wheat, corn (maize), barley, and millet. The locality has many large ravines, and soil erosion is a problem along the rivers. Reclamation and forestation projects have helped to reclaim some of the land. Pop. (1991) town, 124,100.

Etchareottine (people): *see* Slave.

etched glass, type of glassware whose decorative design has been cut into the surface by the corrosive action of an acid. An etched-glass surface may be either rough and frosted or satiny smooth and translucent, depending largely on the composition of the glass and the amount of time the glass is exposed to the acid. Design transfer is accomplished by several methods. In one common practice, the glass is coated with a layer of beeswax or paraffin on which patterns or pictures are traced with metal needles. The glass is then dipped in hydrofluoric acid, which etches the design through the grooves made by the needles in the protective coating. Engraving and enameling are often used in conjunction with the etching process to enhance the decorative design.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

etching, a method of making prints from a metal plate, usually copper, into which the design has been incised by acid. The copperplate is first coated with an acid-resistant substance, called the etching ground, through which the

design is drawn with a sharp tool. The ground is usually a compound of beeswax, bitumen, and resin. The plate is then exposed to nitric acid or dutch mordant, which eats away those areas of the plate unprotected by the ground, forming a pattern of recessed lines. These lines hold the ink, and, when the plate is applied to moist paper, the design transfers to the paper, making a finished print.

In the variety of etching known as aquatint (*q.v.*), a copperplate is exposed to acid through a layer of granulated resin or sugar, leaving an evenly pitted surface that yields broad areas of tone when the grains are removed and the plate is printed. Etching and aquatint are often combined in a print by means of successive workings of its plate.

"The Woman with the Arrow," etching by Rembrandt, 1661

By courtesy of the National Gallery of Art, Washington, D.C., Rosenwald Collection

The practice of making prints from etched metal plates grew out of the custom of etching designs on armour and was adopted by printmakers as an easy way of engraving, a process of making prints from metal plates incised with a tool called a burin. The first dated etching was made in 1513 by the Swiss artist Urs Graf, who printed from iron plates. The prolific German graphic artist Albrecht Dürer made only five etchings. In his "Canon" (1518), he tried to imitate the formal, premeditated quality of engravings, revealing that etching's spontaneity and flowing line were as yet not valued in northern Europe. The 16th-century Italian artist Parmigianino, however, made etchings with easy, graceful strokes that show his full understanding of the technique. In France, the printmaker Jacques Callot used etching as an aid to engraving in his series "Miseries of War" (1633). He not only incised the metal when drawing through the ground but also reinforced the lines with an engraver's burin after the plate had been exposed to acid.

The first and perhaps greatest master of pure etching was Rembrandt (1606–69). He abandoned all links with engraving and produced over 300 etchings with unsurpassed virtuosity, using the freedom inherent in the medium to render light, air, and space. The 18th-century Venetian artists Giovanni Battista Tiepolo and Canaletto also used etching to capture atmospheric effects, and the Roman etcher

and archaeologist Giambattista Piranesi used etching to serve his fantasy in his series "Carceri" (c. 1745), a group of interior views of foreboding imaginary prisons. More horrific was the series "Los desastres de la guerra" (1810–14), by the Spanish artist Francisco de Goya. Unlike most of his other prints, Goya's "Desastres" were done mainly in etching with little aquatint.

During the late 18th and early 19th centuries, soft-ground etching, or *vernis mou*, became current. This technique involves drawing with a pencil on a sheet of paper placed on a copperplate coated with an extremely soft, sticky ground. The ground adheres to the paper wherever the pencil passes, leaving the metal exposed in broad, soft lines. The plate is exposed to acid and, when printed, yields results similar to pencil or chalk drawings. It was primarily a reproductive technique but was used by the 18th-century English artists Thomas Gainsborough, John Sell Cotman, and Thomas Girtin for original designs, mainly landscapes.

Etching continued to be used by most artists throughout the 19th century, and in the 20th century the technique was adopted with new enthusiasm by several prominent artists. Primary among them is Pablo Picasso, who first made etching a vehicle for his Cubist ideas and subsequently exploited the technique's purity of line in his "classical" period. Henri Matisse, Marc Chagall, Georges Rouault, Joan Miró, and Stanley Hayter also did much important work in this medium.

etesian wind, remarkably steady southbound drift of the lower atmosphere over the eastern Mediterranean and adjacent lands in summer. From about mid-May to mid-September, it generally dominates the Adriatic, Ionian, and Aegean seas and the adjacent countries.

The name (from Greek *etos*, "year") is suggestive of the wind's regular recurrence. The wind is of such significance to human activities that the ancient Greeks announced its expected beginning in the marketplaces. An extreme example of its constancy is at Cairo, where July winds blow from the northwest, north, or northeast 98 percent of the time.

The etesian wind, which reaches maximum intensity in the early afternoon and may cease during the night, is part of the general inflow of air toward an intense low-pressure area usually centred over northwestern India in summer. The wind is not of the class generally termed monsoon winds because it is practically rainless, is not accompanied by high relative humidity, and is not replaced in winter by a drift from the opposite direction.

Similar wind regimes and climates, called etesian climates and characterized by dry summers and rainy winters, are present in California, Chile, South Africa, and southwestern Australia.

ethanal (chemistry): *see* acetaldehyde.

ethane, a colourless, odourless, gaseous hydrocarbon (compound of hydrogen and carbon), belonging to the paraffin series; its chemical formula is C_2H_6 . Ethane is structurally the simplest hydrocarbon that contains a single carbon-carbon bond. The second most important constituent of natural gas, it also occurs dissolved in petroleum oils and as a by-product of oil refinery operations and of the carbonization of coal.

The industrial importance of ethane is based upon the ease with which it may be converted to ethylene (C_2H_4) and hydrogen by pyrolysis, or cracking, when passed through hot tubes. Like propane and, to a lesser extent, butane, ethane is a major raw material for the huge ethylene petrochemical industry, which produces such important products as polyethylene plastic, ethylene glycol, and ethyl alcohol.

More than 90 percent of the ethane produced in the 1960s was burned as fuel without

separation from natural gas. Ethane gas can be liquefied under pressure or at reduced temperatures and thus be separated from natural gas. Unlike propane, liquid ethane is not in common use as an industrial or domestic fuel.

ethanol: *see* ethyl alcohol.

ethanolamine, the first of three organic compounds that can be derived from ammonia by successively replacing the hydrogen atoms with hydroxyethyl radicals ($-CH_2CH_2OH$), the others being diethanolamine and triethanolamine. The three are widely used in industry, principally as absorbents for acidic components (e.g., carbon dioxide) of natural gas and of petroleum-refinery gas streams. As salts (soaps) with fatty acids, they are used as emulsifiers in numerous household and industrial products. Triethanolamine is a corrosion inhibitor for automobile antifreeze solutions and airplane-engine coolants. The ethanolamines are commercially prepared by the reaction of ammonia and ethylene oxide.

Ethelbald (personal name): *see under* Aethelbald.

Ethelbert (personal name): *see under* Aethelberht.

Ethelred (personal name): *see under* Aethelred, except as below.

Ethelred II, also spelled AETHELRED, byname AETHELRED THE UNREADY, or AETHELRED UNRAED (b. 968?—d. April 23, 1016, London), king of the English from 978 to 1013 and from 1014 to 1016. He was an ineffectual ruler who failed to prevent the Danes from overrunning England. The epithet "unready" is derived from *unraed*, meaning "evil counsel."

Ethelred II, coin, 10th century; in the British Museum
Peter Clayton

The son of King Edgar (ruled 959–975), Ethelred ascended the throne upon the assassination of his half brother King Edward the Martyr in March 978. Widespread suspicion that Ethelred may have had a part in the murder created much of the distrust and disloyalty that undermined his authority. Hence, there was no unified defense when the Danish invasions resumed in 980.

Nearly all of the country was ravaged, and Ethelred's efforts to buy peace only made the invaders more rapacious. When they did begin to settle down in towns, Ethelred provoked further invasions by launching a massacre of Danish settlers (Nov. 13, 1002). By the end of 1013 the Danish king Sweyn I had been accepted as king in England, and Ethelred had fled to Normandy.

After Sweyn died in February 1014, Ethelred's council of advisers invited him to re-

turn to the throne on condition that he agree to satisfy their grievances. At the time of Ethelred's death in 1016, Sweyn's son Canute was ravaging England. Ethelred was succeeded by his son Edmund II Ironside (ruled 1016); one of his other sons ruled England as Edward the Confessor from 1042 to 1066.

Ethelwulf (Anglo-Saxon king): *see* Aethelwulf.

ether, also spelled AETHER, also called LUMINIFEROUS ETHER, in physics, a theoretical, universal substance believed during the 19th century to act as the medium for transmission of electromagnetic waves (e.g., light and X-rays) much as sound waves are transmitted by elastic media such as air. The ether was assumed to be weightless, transparent, frictionless, undetectable chemically or physically, and literally permeating all matter and space. The theory met with increasing difficulties as the nature of light and the structure of matter became better understood; it was seriously weakened (1881) by the Michelson-Morley experiment (*q.v.*), which was designed specifically to detect the motion of the Earth through the ether and which showed that there was no such effect.

With the formulation of the special theory of relativity by Einstein in 1905 and its acceptance by scientists generally, the ether hypothesis was abandoned as being unnecessary in terms of Einstein's assumption that the speed of light, or any electromagnetic wave, is a universal constant.

ether, any of a class of organic compounds characterized by an oxygen atom attached to two carbon atoms that are part of a hydrocarbon. Ethers are similar to alcohols but are generally less dense, less soluble in water, and have lower boiling points. They are relatively inert.

A brief treatment of ethers follows. For full treatment, *see* MACROPAEDIA: Chemical Compounds.

At room temperature, ethers are pleasant smelling, colourless liquids. In nature, ethers are found as part of substances such as sugar, starch, and cellulose. Ethers may be manufactured by dehydrating alcohols, but catalytic hydration (addition of water) of olefins (forms of hydrocarbons) is the major method of production.

While often regarded as derivatives of alcohol, ethers exhibit properties that are more likely to resemble those of their parent hydrocarbons. They form salts called oxonium compounds when they are reacted with strong inorganic acids and Lewis acids (compounds capable of accepting electron pairs). When strong acids break one of the carbon-oxygen linkages, alcohols are formed. Other organic derivatives are produced if both linkages are broken. Heat decomposes ethers into olefins. In the presence of oxygen, ethers slowly oxidize to unstable peroxides; this reaction can result in an explosion.

Ethers will form azeotropes (constant-distillation mixtures) with a large number of organic compounds. As a result, they are used extensively for extraction and separation of organic chemicals. Ethers are also employed as solvents for fats, oils, waxes, perfumes, resins, dyes, gums, and hydrocarbons. Vapours of certain ethers are used as insecticides, miticides, and fumigants for soil. Ethers are also very important in medicine and pharmacology, especially for use as anesthetics. Codeine,

for example, is the methyl ether of morphine. Ethyl ether is best known as an anesthetic. A highly volatile liquid, it is also used as a solvent, an extractant, and a reaction medium. Methyl ether is used as a spray propellant and refrigerant. The ethers of ethylene glycol are used as solvents and plasticizers.

Etherege, Sir George (b. c. 1635, Maidenhead, Berkshire, Eng.?—d. c. May 10, 1692), creator of the English Restoration comedy of manners.

Etherege probably accompanied his father to France in the 1640s. About 1653 his grandfather apprenticed him to an attorney in Beaconsfield, Buckinghamshire.

Etherege's first comedy, *The Comical Revenge; or, Love in a Tub*, was premiered at Lincoln's Inn Fields Theatre in 1664. An immediate success, it was novel in its exploitation of contemporary manners, especially in the intrigue of the stylish Sir Frederick Frollick. It still followed earlier tradition, with its romantic plot, in heroic couplets and blank verse, and farcical subplot. Its success gave Etherege an entrée into the world of fashion, where he became the boon companion of the literary rakes Sir Charles Sedley, the Earl of Rochester, and the Earl of Dorset.

She wou'd if she cou'd, Etherege's second comedy (1668), failed because of poor acting. It was the first comedy of manners to attain unity of tone by shedding the incongruous romantic verse element.

From 1668 to 1671 Etherege was in Turkey as secretary to the English ambassador, Sir Daniel Harvey. After his return he wrote the prologue for the opening in 1671 of the new Dorset Garden Theatre. There his last and wittiest comedy, *The Man of Mode, or, Sir Fopling Flutter*, was produced with acclaim in 1676. He was knighted in 1680.

Etherege was appointed envoy to the Diet in Ratisbon in 1685. His two Letterbooks from there include personal, as well as official, correspondence. Although irresponsible, Etherege showed qualities of loyalty, and he followed his king, James II, to Paris after that monarch was deposed in the "Glorious Revolution" of 1688.

Known to his friends as easy and gentle, Etherege had a relish for life and a shrewd knowledge of men. His style of comedy was successfully cultivated by his successors and persisted to modern times. His own plays, however, failed to hold the stage after the mid-18th century. His love lyrics are among the most charming of their day.

Ethical Culture, a movement based upon the conviction that moral tenets need not be grounded in religious or philosophical dogma. Ethical culture has sought to promote social welfare through community effort. The movement originated in New York City under the leadership of Felix Adler in 1876. Adler contended that Judaism and Christianity were mistaken in making ethics dependent on religious dogma. Adler started with the basic principle of the 18th-century German philosopher Immanuel Kant that every human being is an end in himself and is worthwhile on his own account. He had three basic goals for the Society for Ethical Culture, which he founded: (1) sexual purity, (2) devoting surplus income to the improvement of the working classes, and (3) continued intellectual development. The movement spread to England, France, Germany, Austria, Switzerland, Japan, and India.

Adler promoted the movement as a religion that included Sunday services, solemnization of marriages, and funerals. Other leaders in the movement were W.M. Salter, Stanton Coit, and Walter L. Sheldon.

Ethical Policy, in Indonesian history, a program introduced by the Dutch in the East Indies at the turn of the 20th century aimed at promoting the welfare of the indigenous Indonesians (Javanese). Toward the end of the 19th century, leaders of the ethical movement argued that The Netherlands had acquired huge revenues from Indonesians by means of compulsory labour under the *Cultuur-Stelsel*, or Culture System (*q.v.*), and that the time had come for the Dutch to pay "the debt of honour" to the Indonesian people by promoting reforms in education and agriculture and by decentralizing the Indies administration, providing more autonomy for Indonesian officials. This policy led to the development of a Dutch school system in the Indies and a further penetration of the Western economic system in the rural areas. Rapid social change took place in the Indies. Social dislocation eventually manifested itself in the form of unrest, which caused the Dutch authorities to reconsider the Ethical Policy program. The Governor General in about 1925 began to discontinue the policy, but its total abolition took place only after the 1926–27 Indonesian Communist Uprisings.

ethical relativism, the view that what is right or wrong and good or bad is not absolute but variable and relative, depending on the person, circumstances, or social situation. The view is as ancient as Protagoras, a leading Greek Sophist of the 5th century BC, and as modern as the scientific approaches of sociology and anthropology.

Many people's understanding of this view is often vague and confused. It is not simply the belief, for example, that what is right depends on the circumstances, because everyone, including the absolutists, agrees that circumstances can make a difference; it is acknowledged that whether it is right for a man to enter a certain house depends upon whether he is the owner, a guest, a police officer with a warrant, or a burglar. Nor is it the belief that what someone thinks is right is relative to his social conditioning, for again anyone can agree that there are causal influences behind what people think is right. Ethical relativism is, rather, the view that what is really right depends solely upon what the individual or the society thinks is right. Because what one thinks will vary with time and place, what is right will also vary accordingly. Ethical relativism is, therefore, a view about the truth status of moral principles, according to which changing and even conflicting moral principles are equally true, so that there is no objective way of justifying any principle as valid for all people and all societies.

The sociological argument for relativism proceeds from the diversity of different cultures. Ruth Benedict, an American anthropologist, suggested, for example, in *Patterns of Culture* (1934) that the differing and even conflicting moral beliefs and behaviour of the North American Indian Kwakiutl, Pueblo, and Dobu cultures provided standards that were sufficient within each culture for its members to evaluate correctly their own individual actions. Thus, relativism does not deprive one of all moral guidance. However, some anthropologists, such as Clyde Kluckhohn and Ralph Linton, have pointed up certain "ethical universals," or cross-cultural similarities, in moral beliefs and practices—such as prohibitions against murder, incest, untruth, and unfair dealing—that are more impressive than the particularities of moral disagreement, which can be interpreted as arising within the more basic framework that the universals provide. Some critics point out, further, that a relativist

has no grounds by which to evaluate the social criticism arising within a free or open society, that his view appears in fact to undercut the very idea of social reform.

A second argument for relativism is that of the skeptic who holds that moral utterances are not cognitive statements, verifiable as true or false, but are, instead, emotional expressions of approval or disapproval or are merely prescriptions for action. In this view, variations and conflicts between moral utterances are relative to the varying conditions that occasion such feelings, attitudes, or prescriptions, and there is nothing more to be said. Critics of the skeptical view may observe that classifying moral utterances as emotive expressions does not in itself disqualify them from functioning simultaneously as beliefs with cognitive content. Or again, they may observe that, even if moral utterances are not cognitive, it does not follow that they are related, as the relativist suggests, only to the changeable elements in their background; they may also be related in a special way to needs and wants that are common and essential to human nature and society everywhere and in every age. If so, the criticism continues, these needs can provide good reasons for the justification of some moral utterances over others. The relativist will then have to reply either that human nature has no such common, enduring needs or that, if it does, they cannot be discovered and employed to ground man's moral discourse.

ethics: *see under* descriptive word (*e.g.*, comparative ethics; normative ethics; teleological ethics), except as below.

ethics, also called MORAL PHILOSOPHY, the discipline concerned with what is morally good and bad, right and wrong. The term is also applied to any system or theory of moral values or principles.

A brief treatment of ethics follows. For full treatment, *see* MACROPAEDIA: Ethics.

The subject of ethics essentially comprises issues fundamental to practical decision-making, and so the discipline, though long considered a branch of philosophy, is closely linked with many other fields of inquiry, including anthropology, economics, politics, and sociology. Ethics, nonetheless, remains distinct from such areas of study in that it is occupied not so much with factual knowledge as it is with values—namely, human conduct as it ought to be, rather than as it actually is.

Ethics is generally divided into three major subdisciplines. These are (1) metaethics, (2) normative ethics, and (3) applied ethics.

Metaethics centres on questions relating to the nature of moral concepts and judgments. Philosophers in metaethics have taken markedly different positions on this matter. Some have held that moral concepts describe natural or supernatural (*i.e.*, metaphysical) entities in the world. Others, while agreeing that moral concepts are descriptive of such entities, have maintained that the entities are entirely unique in kind. Still others assert that the primary function of moral concepts is to express attitudes or emotions or to prescribe or prohibit. Corresponding views about the logical status of moral judgments have been held by these various philosophers: either the judgments are capable of being true or false and of constituting a kind of knowledge, or they are incapable of such and function rather to express attitudes or to convey condemnation and praise. There also has been much disagreement over whether moral judgments are objective or subjective, absolute or relative.

Normative ethics is primarily concerned with establishing standards or norms for conduct and is commonly associated with general theories about how one ought to live. One of the central questions of modern normative ethics has to do with whether human actions are to be judged right or wrong solely accord-

ing to their consequences. Traditionally, theories that judge actions by their consequences have been known as teleological, though the term consequentialist has in large part supplanted it. Another class of theories in normative ethics, designated as deontological, judges actions by their conformance to some formal rule or principle (for example, the ethical system of the philosopher Immanuel Kant).

Perhaps the most striking development in the study of ethics during the second half of the 20th century was the growing interest among philosophers in applied ethics—i.e., the application of normative theories to practical moral problems. Such moral issues as racial and sexual equality, human rights, and justice have become prominent, as have questions about the value of human life raised by controversies over abortion and euthanasia. Related to the latter are the ethical implications of various developments in regard to reproduction as, for example, in vitro fertilization, sperm banks, genetic engineering, and cloning. This field of applied ethics, known as bioethics, frequently involves the cooperative efforts of philosophers, physicians, scientists, lawyers, and theologians.

Ethiopia, Amharic ፊትዮጵያ, officially FEDERAL DEMOCRATIC REPUBLIC OF ETHIOPIA, landlocked country of eastern Africa, situated on the Horn of Africa. Ethiopia is bordered on the north by Eritrea, on the east by Djibouti

Ethiopia

and Somalia, on the south by Kenya, and on the west by The Sudan. The capital is Addis Ababa. Area 437,794 square miles (1,133,882 square km). Pop. (2000 est.) 64,117,000.

A brief treatment of Ethiopia follows. For full treatment, see MACROPAEDIA: Eastern Africa.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. Ethiopia can be divided into five major relief regions: the Western Lowlands, the Western Highlands, the relatively low-lying Eastern (Great) Rift Valley, the Eastern Highlands, and the Eastern Lowlands.

The Western Lowlands extend in a thin crescent along Ethiopia's borders with The Sudan and western Eritrea. The lowlands contain the country's largest drainage system in the watersheds of the Baro, Blue Nile (the Abay), Atbara, and Tekeze rivers, which all rise in the Western Highlands and flow to the White Nile in The Sudan. The Western Highlands include the extensive Ethiopian Plateau and reach elevations between 8,000 and 12,000 feet (2,400 and 3,700 m). The northern end of this region extends into central Eritrea. South of Eritrea are the highly eroded Simen Mountains, containing the highest peak in Ethiopia, Mount Ras Dejen (or Dashen), which rises to 15,157 feet (4,620 m).

The Rift Valley is bounded by the Western and Eastern highlands and extends the length of central Ethiopia from south to north. In its northernmost section lies the arid Denakil Plain. The Eastern Highlands have a largely basaltic cover and reach their highest eleva-

tions along the Rift Valley escarpment, sloping steeply on its eastern side. In the southeastern part of Ethiopia are the Eastern Lowlands, including the arid Hawd and Ogaden regions and the Sidamo-Borena plain. Originating in the Eastern Highlands, the Shebele and Genale rivers flow across the lowlands toward Somalia.

The climate is temperate in the highlands and hot in the lowlands. The average daily temperature at Addis Ababa, which is situated in the highlands, ranges from a minimum of 52° F (11° C) to a maximum of 73° F (23° C). The average annual temperature in the lowlands is about 82° F (28° C). Rainfall for most of Ethiopia is brought by southwesterly winds. There are two rainy seasons, from March to April and from June to August. The amount of annual rainfall varies from about 80 inches (2,000 mm) in the highlands at Gore, in the southwest, to less than 20 inches (500 mm), and sometimes none at all, on the Denakil Plain in the north. Periodic droughts are devastating to the country's agriculture.

The wet and cool highlands are mostly savanna grassland or farmland, with occasional clumps of trees. At higher elevations the subtropical forests are dominated by the yellowwood, an evergreen tree with a pulpy fruit. Acacia predominates in the lowlands; in the southern part of the Rift Valley there is rich savanna grassland with many trees. Among the rare animals of Ethiopia are the *walia* ibex (a type of mountain goat), the mountain nyala (a kind of antelope), and the gelada monkey. Lions, elephants, leopards, buffalo, zbras, giraffes, and rhinoceroses, once abundant, are now endangered. Forest occupies less than one-eighth of the total area. Roughly one-tenth of Ethiopia's land area is farmed, but one-fifth of its land is used for grazing.

The people. One of the two largest ethnic groups in Ethiopia, the Amhara, were culturally and politically dominant for several generations; they constitute almost one-third of the total population and live in the northern and central parts of the country. The other principal group, the Oromo, also account for one-third of the population and live in the western, southern, and eastern parts. Other ethnic groups include the Tigray, Afar, Somali, Saho, and Agew peoples. Amharic, which is the working language of the government, and Oromo are more commonly spoken, but many other Cushitic and Nilotic languages are also in use. About three-fifths of the population are Christian, mostly Ethiopian Orthodox, and nearly one-third are Muslim. A small proportion practice traditional animism.

The urban population forms only about one-sixth of the total. The rural population is concentrated in the highlands. The major city is Addis Ababa. Almost half of Ethiopia's populace is under 15 years of age. Both birth and death rates are high, as is infant mortality.

The economy. Ethiopia is one of the world's poorest countries. The Marxist regime of the Derg nationalized all means of production in the 1970s, including land, housing, farms, and industry. Economic crises and food shortages in the 1980s were exacerbated by drought, civil war, and famine. The new federal government system, which was constitutionally established in 1995, offered a more stable political and economic climate, but investors were slow to return to the country. The gross national product (GNP) is growing much more slowly than the population, and the GNP per capita is one of the lowest in the world.

Agriculture accounts for approximately half the gross domestic product (GDP) and employs almost nine-tenths of the workforce. Production is mainly for subsistence, and yields are generally low; food production is not sufficient for the needs of the populace. Cereals such as corn (maize), barley, wheat, millet, teff (a cereal grass), and sorghum are the main

food crops. Coffee is the main export crop, accounting for about two-thirds of the value of total exports. Other cash crops are oilseeds, beeswax, qat (a stimulant leaf), and sugarcane. Animal husbandry is an important part of agricultural production, for meat as well as for hides and skins.

Manufacturing and mining together account for less than one-tenth of the GDP and employ only a small fraction of the workforce. The manufacturing sector is dominated by food processing (including sugar processing) and the textile industry, followed by shoes and leather goods, tobacco, and chemicals. About four-fifths of Ethiopia's electricity is generated by hydroelectric power plants. The vast majority of the population has no access to electric service, however.

Ethiopia's substantial balance-of-trade deficit can be largely attributed to the internal disorders of the late 20th century, which lowered production of exports and, until the early 1990s and again in the late 1990s, prompted huge increases in the importation of military equipment. Coffee exportation and other foreign trade remain dependent on fluctuating world markets. In addition to coffee, exports largely consist of hides and skins. Chief trading partners include Japan, Germany, Saudi Arabia, Italy, and the United States.

A highway connects Addis Ababa with Nairobi, Kenya, and a railway runs from Addis Ababa to the port of Djibouti, in the Republic of Djibouti, on the Gulf of Aden. The country has two international airports (at Addis Ababa and Bahir Dar). Access to shipping is difficult for the now-landlocked country; access to the former Ethiopian (now Eritrean) ports of Assab (Aseb) and Massawa was cut off in the late 1990s, owing to military hostilities between the two countries, and Ethiopia was forced to channel its trade through Djibouti.

Government and social conditions. Ethiopia was governed from 1974 to 1991 by a collective military dictatorship known as the Provisional Military Administrative Council (PMAC), popularly called the Derg (Amharic: "Committee"). The PMAC was a Marxist regime composed of military officers, and its chairman was the head of state. In 1987 a constitution was promulgated, but the Derg, under the leadership of Mengistu Haile Mariam, retained effective control of the government. After the downfall of Mengistu's regime in 1991, the government of Ethiopia was administered by a transitional regime.

The constitution of 1995 declared a federal republic with a parliamentary form of government. The legislature is composed of the Federal Council and the Council of Peoples' Representatives. Members of both councils are elected to five-year terms. Special provisions ensure the distribution of legislative seats among the numerous ethnic groups of Ethiopia. Under the constitution executive power is vested in the prime minister, who is elected from among the members of the Council of Peoples' Representatives. The prime minister heads a council of ministers, which also includes a deputy prime minister. The head of state is the president, who is elected by the legislative councils to a six-year term. The constitution provided for the decentralization of power and the creation of new states along ethnic lines. States have the right to secede. At the apex of the judicial system is the Federal Supreme Court, and there are supreme, high, and lower courts in every state.

Medical and health care is provided through hospitals and clinics, but rural areas are inadequately served. Modern health services reach only a small part of the population. Ethiopia's main health problems (and causes of death) are infectious and tropical diseases, including

parasitic diseases. Rates of infant mortality are among the highest in the world, and life expectancy at birth is one of the lowest in the world—at about 45 years.

Education in Ethiopia is compulsory for six years, until the age of 13, but in practice both primary and secondary enrollments are low. The main institution of higher education is Addis Ababa University (1950; university status 1961). There are several vocational schools and in-service training programs. About two-thirds of the adult population, however, remains illiterate. The communications medium that reaches the greatest number of people in Ethiopia is radio.

Cultural life. Christianity, now manifest in the Ethiopian Orthodox church, has been traditionally predominant in Ethiopia. The status of Islām was elevated in the late 20th century in an effort to reduce the dominance of the Christian church. Ge'ez (the language of the Ethiopian Orthodox church) is traditionally important, but Amharic and Oromo are the most commonly spoken languages. Ethiopia's main museums, libraries, and research institutes are located in Addis Ababa.

History. Ethiopia has been inhabited since great antiquity; among the hominid remains found there are those attributed to the genus *Australopithecus*, some of which are thought to be about four million years old.

Between the 8th and 6th millennia BC, pastoralism and agriculture were developed by the area's Afro-Asiatic-speaking peoples, from which Ethiopia's Cushitic and Semitic speakers are cultural descendants. Ge'ez-speaking agriculturalists arrived in the Tigrayan highlands from the 2nd millennium BC and established the kingdom of Da'amat. A great source of wealth was the trade of ivory, rhinoceros horn, precious metals, and slaves. After 300 BC the Da'amat kingdom was superseded by the inland state of Aksum. According to legend Menilek I, the progenitor of the Solomonid dynasty of Aksum, was the son of the Israelite king Solomon and the Queen of Sheba (Makeda).

Christianity was introduced from the 4th century AD and became widespread, but Ethiopia's prosperous Mediterranean trade was cut off by the Arabs in the 7th and 8th centuries. With the decline of Aksumite trade, the Zagwe dynasty supplanted the Solomonids and moved the capital southward to Roha. In the 13th century the emperor Yitbarek was killed and a new Solomonid dynasty was proclaimed. The Solomonid emperor Amda Tseyon and his successors battled against the encroachments of Muslim sultanates, but the kingdom was almost completely conquered by the sultan Ahmad Grān before he was defeated by the Portuguese-trained army of Emperor Galawdewos in 1543.

In the 18th century began the Zamana Masafent ("Age of the Princes"), 150 years of feudal anarchy marked by marauding armies and the destabilization of agricultural production. During this period the kingdom of Shewa in the south became the most stable centre of power, under King Sahle Selassie (reigned 1813–47). In the north, the warlord Kassa Hailu defeated the last of the Oromo princes and consolidated his rule over Tigray; after his coronation as Tewodros II in 1855, he forced the submission of Shewa. Tewodros was guilty of political misjudgments, however, and he committed suicide after inciting a British attack. A Tigrayan noble took the crown as Yohannes IV in 1872. After ejecting two Egyptian armies from Eritrea in 1875–76, he brought the Shewa king Menilek under his rule. Yohannes was successful in repulsing Italian advances until he was killed in battle (1889), whereupon Menilek took the throne. The Treaty of Wichale (Ucciali), signed be-

tween the two countries in 1889, itself became a source of contention and hostilities were subsequently renewed, but in 1896 Menilek soundly defeated the Italians at the Battle of Adowa (Adwa).

Under Menilek II, Ethiopia expanded to its present size, a railway was constructed between Addis Ababa and Djibouti, and the capital was modernized with new schools and hospitals. Coffee exports led Ethiopia to relative economic prosperity in the 1920s, and the emperor Haile Selassie I expanded modernization projects in the 1930s. Italy invaded Ethiopia in 1935–36 and occupied most of the country until 1941.

In 1952 Ethiopia incorporated Eritrea and thus secured an outlet to the sea. Haile Selassie promulgated a revised constitution in 1955 that delegated more powers to parliament, but there was increasing popular discontent. Opposition to the monarchy grew, including political violence in Eritrea, the Ogaden region in the southeast, and elsewhere. In 1974 the emperor was deposed in a military coup d'état and socialist Ethiopia was proclaimed. The PMAC was established, and by 1977 Mengistu Haile Mariam emerged as head of state and chairman of the Derg.

The military government was faced with a civil war in Eritrea and Tigray and conflict with Somalia over the Ogaden region. Eritrean secessionists fought unceasingly for independence, and armed groups in Tigray were bent on overthrowing the government. These conflicts, combined with poorly designed land-reform policies, were exacerbated by the region's cyclical drought and accompanying famine conditions, which periodically brought millions to the brink of starvation in the late 20th century. The collapse of the Soviet Union—which had supported Mengistu—and the combined efforts of the rebel forces brought down the government. With the new government's acquiescence, Eritrean independence was declared in May 1993. In 1995 a federal constitution was promulgated that distributed greater power among the states of Ethiopia, which were newly organized along ethnic lines. Ethiopia fought a costly war with Eritrea beginning in 1998. A treaty ending hostilities was signed in late 2000.

Ethiopian chant, vocal liturgical music of the Ethiopian Orthodox Christians in eastern Africa. A musical notation for Ethiopian chant introduced in the 16th century is called *melekkt* and consists of characters from the ancient Ethiopian language, Ge'ez, in which each sign stands for a syllable of text. These characters seem also to serve as a cue for a specific melodic formula, or *serayu*. In performance, a formula is embellished with improvised melodic ornaments. There are also apparently three distinctly different manners of chanting: *ge'ez*, in which most melodies are performed; *araray*, presumably containing "cheerful" melodies and used only infrequently in services; and *ezel*, used in periods of fasting and sorrow. According to Ethiopian tradition, these forms were revealed in the 6th century to a chanter named Yared, who composed the entire body of hymns (since revised) that is found in the six books of chants. The first known manuscripts, however, date to the 14th century. The *debtara*, an unordained member of the clergy, is well versed in the Ethiopian church rituals, in aspects of the liturgy, and in the scriptures; he is also trained to distinguish the subtleties of moods and manners of performance. Although he is required to copy the whole body of liturgical chants while a student, in the end he memorizes the melodies and improvises along the outlines of basic melodic formulas.

Ethiopian literature, writings either in classical Ge'ez (Ethiopic) or in Amharic, the principal modern language of Ethiopia. The earliest extant literary works in Ge'ez are

translations of Christian religious writings from Greek, which may have influenced their style and syntax. From the 7th century to the 13th, a period marked by political disturbances, there was no new literary activity; but, with the proclamation of the new Solomonid dynasty in Ethiopia in 1270, there began the most productive era of Ge'ez literature, again characterized by translation, not from Greek but from Arabic, though the originals were frequently Coptic, Syriac, or Greek. The subject matter was mostly theological or strongly flavoured by religious considerations. The most interesting work of this period was the 14th-century *Kebrā Negast* ("Glory of the Kings"), a combination of mythical history, allegory, and apocalypse.

Abba Salama, an Egyptian Copt who became metropolitan of Ethiopia in 1350, was not only responsible for a revision of the text of the Bible but translated or induced others to translate several books popular among the Ethiopian faithful. The rhapsodical *Weddase Mariam* ("Praise of Mary") is appended to the Psalter (the Psalms) and thus has almost canonical status. In a slightly later period, about the beginning of the 15th century, various separate lives of saints and martyrs, including St. George (the patron saint of Ethiopia), were written. At this time was undertaken a translation of the Arabic Synaxarium, containing lives of saints.

The early 15th century saw the translation of several apocalyptic books, which inspired two original compositions. *Fekkare Iyasus* ("Elucidation of Jesus") was written during the reign of Tewodros I (1411–14); "Mystery of Heaven and Earth" was written somewhat later and is noteworthy for a vigorous account of the struggle between the archangel Michael and Satan. This book must not be confused with another original work of the same period, the "Book of Mystery" by Giorgis of Sagla, a refutation of heresies. The large hymns and antiphonaries called *Deggua*, *Mawase'et*, and *Me'raf* also probably dated from this time, though some of the anthems may be older. Another type of religious poetry first composed during the 15th century was the *mal'ke* ("likeness"), consisting generally of about 50 five-line rhyming stanzas, each addressed to a different physical or moral attribute of the saint apostrophized. As a last example of the religious literature of the "golden age" may be mentioned the "Miracles of Mary," translated from Arabic in 1441–42; it was enormously popular and went through several recensions.

During the Muslim incursion of 1527–43, Ethiopian literary activity ceased and many manuscripts were destroyed; Islāmization was widespread, and, even after the repulsion of the invaders, the country never fully recovered. A Muslim merchant who had been converted to Christianity and, as Enbaqom (Habakkuk), became prior of the monastery of Debre Libanos, wrote *Anqas'a amin* ("Gate of Faith") to justify his conversion and to persuade apostates to recant. Other similar works were produced, and several were written to defend the Monophysite branch of the Christian faith. Meanwhile the arrival of Roman Catholic missionaries constituted a further danger to the Ethiopian Orthodox church.

The ancient language of Ge'ez had by now lost its vigour and became a liturgical language in which few people were thoroughly conversant. During the 16th century, Amharic, the principal spoken language, was beginning to be used for literary purposes, and Amharic expressions even appeared in royal chronicles. About 1600, nevertheless, a few substantial works in Ge'ez appeared, including *Hawi*, an enormous theological encyclopaedia translated by Salik of Debre Libanos; a *History* by Johannes Madabbar, bishop of Nikiu, containing an account of the Arab conquest of Egypt, valuable since the Arab original has been lost; and *Fetha Negast* ("Justice of the

Kings"), a compilation of canon and civil law. Ge'ez poetry (*gene*) flourished, at Gonder particularly, in the 18th century and has since continued to be practiced at many monasteries. Some poems of Alaqa Taye were printed in Asmara (now in Eritrea) in 1921, and an important anthology compiled by Hiruy Walde Selassie was published at Addis Ababa in 1926.

Ethiopia's Jewish population, known as Falasha, who lived mostly in regions north of Lake Tana, still used Ge'ez as their sacred language. Besides the Old Testament (including the *Book of Jubilees*), the Falasha have a few books peculiar to themselves, notably *T'ezaza Sanbat* ("Ordinance of the Sabbath"), of uncertain date and perhaps mostly a translation from Arabic of the 14th century. A *Falasha Anthology* was published by Wolf Leslau in 1951. By 1992 nearly the entire Falasha population had migrated to Israel.

The earliest known Amharic compositions are songs celebrating the victory of Amda Tseyon (1314–44). From the 16th century onward, theological works were produced. A translation of the Bible was made in Cairo early in the 19th century (though probably not by a true Ethiopian, to judge by the quality of the Amharic), and from this version missionary societies composed their editions. Revisions were made by foreigners with an inadequate knowledge of Amharic. A more scholarly version of the New Testament was printed in Addis Ababa in 1955, followed by the Old Testament in 1961. The first official chronicles wholly in Amharic were those of Tewodros II (1855–68). A translation of John Bunyan's *Pilgrim's Progress* made in 1892 pointed the way to a new popular form—the allegorical novel, often partly in verse, with a religious bias, of which the first was *Libb walad tarik* (1908; "Imaginative Story") by Afevorq Gabre-Eyesus. During the regency of Ras Tafari (1916–20; afterward Emperor Haile Selassie I), Hiruy Walde Selassie (d. 1938) became the leading Amharic writer, especially notable for allegorical compositions such as *Wadaje lebbe* ("My Heart as My Friend").

With the restoration of Ethiopian independence after the Italian occupation of 1936–41, a great impetus was given to Amharic literature, with Emperor Haile Selassie encouraging authors to produce many types of books, especially on moral and patriotic themes. Writers of merit during this period were Makonnen Endalkachew (who produced allegorical novels and plays), Kebede Mikael (verse dramas, some history and biography), and Tekle Tsodeq Makuria (histories). (S.G.W.)

BIBLIOGRAPHY. Tadesse Adera and Ali Jimal Ahmed (eds.), *Silence Is Not Golden: A Critical Anthology of Ethiopian Literature* (1995).

Ethiopian Orthodox church, also called ETHIOPIAN CHURCH, Ge'ez TEWAHDO, independent Christian patriarchate in Ethiopia holding to Monophysite (*q.v.*) doctrine, that is, that Christ has only one nature. The church recognizes the honorary primacy of the Coptic patriarch of Alexandria. It is headquartered in Addis Ababa.

Ethiopia was Christianized in the 4th century AD by two brothers from Tyre—St. Frumentius, later consecrated the first Ethiopian bishop, and Aedesius. They won the confidence of King Ezana at Aksum (a powerful kingdom in northern Ethiopia) and were allowed to evangelize. Toward the end of the 5th century, nine monks from Syria, probably Monophysites, are said to have brought monasticism to Ethiopia and encouraged the translation of the Scriptures into the Ge'ez language. The Ethiopian church followed the Coptic church (in Egypt) when the latter continued to adhere to the Monophysite doctrine after this doctrine had been condemned by the bishops of Rome and Constantinople at the Council of Chalcedon in AD 451.

In the 7th century the conquests of the Muslim Arabs cut off the Ethiopian church from contact with most of its Christian neighbours. The church absorbed various syncretic beliefs in the following centuries, but contact with the outside Christian world was maintained through the Ethiopian monastery in Jerusalem.

Beginning in the 12th century, the patriarch of Alexandria appointed the Ethiopian archbishop, known as the *abuna* (Arabic: "our father"), who was always an Egyptian Coptic monk; this created a rivalry with the native *ishage* (abbot general) of the strong Ethiopian monastic community. Attempts to shake Egyptian Coptic control were made from time to time, but it was not until 1929 that a compromise was effected: an Egyptian monk was again appointed *abuna*, but four Ethiopian bishops were also consecrated as his auxiliaries. A native Ethiopian *abuna*, Basil, was finally appointed in 1950, and in 1959 an autonomous Ethiopian patriarchate was established.

The Amhara and Tigray peoples of the northern and central highlands have historically been the principal adherents of the Ethiopian Orthodox church, and the church's religious forms and beliefs have been the dominant element in Amhara culture. Under the Amhara-dominated Ethiopian monarchy, the Ethiopian Orthodox church was declared to be the state church of the country, and it was a bulwark of the regime of Emperor Haile Selassie. Upon the abolition of the monarchy and the institution of socialism in the country beginning in 1975, the Ethiopian Orthodox church was disestablished, its patriarch was removed, and the church was divested of its extensive landholdings. The church was placed on a footing of equality with Islam and other religions in the country, but it nevertheless remained Ethiopia's most influential religious body.

Church, 14th century, Gorgora, Eth.

Alain Froissadey—Atlas Photos

The clergy is composed of priests and deacons, who conduct the religious services, and *deberta*, who, though not ordained, perform the music and dance associated with church services and also function as astrologers, scribes, wizards, and fortune-tellers and learn church lore. Ethiopian Orthodox Christianity blends Christian conceptions of God, saints, and angels with non-Christian beliefs in benevolent and malevolent spirits and imps (minor devils). Considerable emphasis is placed on the Old Testament. Circumcision is almost universally practiced; the Saturday Sabbath (in addition to Sunday) is observed by some devout believers; the ark is an essential item in every church; and rigorous fasting is still practiced.

In the early 21st century the church had about 33,000,000 adherents in Ethiopia and nearly 2,000,000 in Eritrea.

Ethiopian Plateau, highlands covering much of Ethiopia and central Eritrea. They consist of the rugged Western Highlands and the more limited Eastern Highlands. The two sections are separated by the vast Eastern Rift Valley, which cuts across Ethiopia from

southwest to northeast. The Western Highlands extend from central Eritrea and northern Ethiopia to the basin of Lake Rudolf in the south and include the traditional lands of the Amhara and Tigray peoples.

Ethiopian region, also called AFROTROPICAL REGION, one of the major land areas of the world defined on the basis of its characteristic animal life. Part of the Palearctic, or Afro-Tethyan, realm, it encompasses Africa south of the Sahara and the southwestern tip of Arabia. The Ethiopian region has the world's largest concentration of antelopes, giraffes, gorillas, and rhinoceroses, as well as a rich variety of other animals.

Ethiopianism, religious movement among sub-Saharan Africans that embodied the earliest stirrings toward religious and political freedom in the modern colonial period. The movement was initiated in the 1880s when South African mission workers began forming independent all-African churches, such as the Tembu tribal church (1884) and the Church of Africa (1889). An ex-Wesleyan minister, Mangena Mokone, was the first to use the term when he founded the Ethiopian Church (1892). Among the main causes of the movement were the frustrations felt by Africans who were denied advancement in the hierarchy of the mission churches and racial discontent. Other contributing factors were the desire for a more African and relevant Christianity, for the restoration of tribal life, and for political and cultural autonomy expressed in the slogan "Africa for the Africans" and also in the word Ethiopianism.

The mystique of the term Ethiopianism derived from its occurrence in the Bible (where Ethiopia is also referred to as Kush, or Cush) and was enhanced when the ancient independent Christian kingdom of Ethiopia defeated the Italians at Adwa (Adowa) in 1896. The word therefore represented Africa's dignity and place in the divine dispensation.

Parallel developments occurred elsewhere. In Nigeria the so-called African churches—the Native Baptist Church (1888), the formerly Anglican United Native African Church (1891) and its later divisions, and the United African Methodist Church (1917)—were important. Other Ethiopian-related movements were represented by the Cameroun Native Baptist Church (1887); by the Native Baptist Church (1898) in Ghana; in Rhodesia by a branch (1906) of the American Negro denomination, the African Methodist Episcopal Church, and by Nemaparc's African Methodist Church (1947); and by the Kenyan Church of Christ in Africa (1957), formerly Anglican.

Early Ethiopianism included tribalist, nationalist, and Pan-African dimensions, which were encouraged by association with American black churches and radical leaders with "back to Africa" ideas and an Ethiopianist ideology.

Ethiopian movements played some part in the Zulu rebellion of 1906 and especially in the Nyasaland rising of 1915 led by John Chilembwe, founder of the independent Providence Industrial Mission. From about 1920, political activities were channeled into secular political parties and trades unions, and the use of the term Ethiopian then narrowed to one section of African independent religious movements (see Zionist church).

By the early 1970s the term Ethiopianism was not in popular use outside southern Africa and, when employed for this form of religious movement elsewhere in Africa, is used by many but not all scholars as a historical or classificatory term.

Ethiopic alphabet, writing system used to write the Ge'ez literary and ecclesiastical lan-

guage and the Amharic, Tigre, and Tigrinya languages of Ethiopia and Eritrea. Apparently derived from Sabaean, a South Semitic script, the Ethiopic script probably originated in the early 4th century AD; it is unclear whether Ethiopic resulted from a gradual evolution of the Sabaean script or whether it was invented deliberately by some individual who used the Sabaean script as a model. Current opinion is that the letters were derived gradually from Sabaean, while the vocalic (vowel) markings used with the letters were the work of a single individual. Inscriptions from the 4th century occur in the Ge'ez language both in Sabaean and in varieties of the Ethiopic script.

The Ethiopic alphabet consists of 26 letters, all representing consonants, which may be transformed into syllabic symbols by the attachment of the appropriate vocalic markers to the letters. The 26 letters are derived from 24 of the 28 letters in Sabaean, plus added letters to represent the *p* sound, which did not exist in the Sabaean language. The direction of writing, unlike that of Sabaean and the other Semitic languages, is from left to right; this is probably a result of Greek influence.

Ethiopic language: see Ge'ez language.

Ethiopic languages, the Semitic languages of Ethiopia and Eritrea, including Ge'ez, the liturgical language of the Ethiopian Orthodox church; Amharic, one of the principal languages of modern Ethiopia; Tigre; Tigrinya, or Tigrai; Argobba; Hareri; and Gurage. Although some scholars formerly considered Ethiopic to be a separate branch of Semitic, these languages are now generally grouped together with the dialects of the South Arabic language as Southern Peripheral Semitic or South Arabic-Ethiopic. See also Ge'ez language; Amharic language.

ethnic cleansing, a policy aimed at the creation of an ethnically homogeneous geographic area through the deportation or forcible displacement of persons belonging to a particular ethnic group. Ethnic cleansing sometimes involves the removal of all physical vestiges of the targeted group through the destruction of monuments, cemeteries, and houses of worship.

The term *ethnic cleansing* was widely employed in the 1990s (though it first appeared earlier) to describe the brutal treatment of various civilian groups in the conflicts that erupted upon the disintegration of the Federal Republic of Yugoslavia. These groups included Bosniacs (Bosnian Muslims) in Bosnia and Herzegovina, Serbs in the Krajina region of Croatia, and ethnic Albanians and later Serbs in the Serbian province of Kosovo. The term also has been attached to the treatment by Indonesian militants of the people of East Timor, many of whom were killed or forced to abandon their homes after the province voted in favour of independence in 1999, and to the plight of Chechens who fled areas of Chechnya following Russian military operations against Chechen separatists during the 1990s.

Ethnic cleansing as a concept has generated considerable controversy. Some critics view it as not importantly distinct from the concept of genocide. Defenders, however, argue that ethnic cleansing and genocide can be distinguished by the intent of the perpetrator: whereas the primary goal of a genocidal policy is the destruction of an ethnic, racial, or religious group, the main purpose of ethnic cleansing is the establishment of ethnically homogeneous lands, which may be achieved by numerous methods including genocide.

Another major controversy concerns the question of whether ethnic cleansing originated in the 20th century. Some scholars have claimed that the forced resettlement of mil-

lions of people by the Assyrians in the 9th and 7th centuries BC and of the Jews by the Romans in the 1st and 2nd centuries AD are among many pre-20th century cases of ethnic cleansing. Others argue that ethnic cleansing, unlike earlier acts of forced resettlement, is the result of certain uniquely 20th-century developments, such as the rise of powerful nation-states fueled by nationalist and pseudoscientific racist ideologies in conjunction with the spread of advanced technology and communications. Examples of 20th-century ethnic cleansing include the massacres of Armenians by the Turks in 1915–16 (see Armenian massacres), the Holocaust (*q.v.*) of European Jews in the 1930s and '40s, the expulsion of Germans from Polish and Czechoslovak territory after World War II, the Soviet Union's deportation of certain ethnic minorities from the Caucasus and Crimea during the 1940s, and the forced migration and mass killings in Yugoslavia and Rwanda in the 1990s.

The precise legal definition of ethnic cleansing has been the subject of intense debate within various international bodies, including the UN, the two ad hoc international tribunals created in the 1990s to prosecute violations of international humanitarian law in the former Yugoslavia and Rwanda, and the International Criminal Court (*q.v.*; ICC), established in 2002. In 1992 the UN General Assembly declared ethnic cleansing "a form of genocide," and in the following year the Security Council established a tribunal to investigate allegations of various war crimes and crimes against humanity, including ethnic cleansing. In a subsequent case, the tribunal recognized similarities between acts of genocide and ethnic cleansing, noting that both involve the targeting of individuals because of their membership in an ethnic group.

The links between ethnic cleansing and genocide, crimes against humanity, and war crimes were reinforced by the establishment of the ICC. In its final text on the elements of the crimes in the court's jurisdiction, the Preparatory Commission for the International Criminal Court made clear that ethnic cleansing can constitute all three of the latter offenses.

(G.J.An.)

ethnic group, a social group or category of the population that, in a larger society, is set apart and bound together by common ties of race, language, nationality, or culture.

Ethnic diversity is one form of the social complexity found in most contemporary societies. Historically it is the legacy of conquests that brought diverse peoples under the rule of a dominant group; of rulers who in their own interests imported peoples for their labour or their technical and business skills; of industrialization, which intensified the age-old pattern of migration for economic reasons; or of political and religious persecutions that drove people from their native lands.

Until the 20th century ethnic diversity posed no great problems for empires. Its chief historic significance has been and remains its relationship to the nation-state, whose primary goal is political unity, which tends to be identified with social unity. In theory, the nation-state and ethnic diversity are diametrically opposed, and on many occasions nation-states have attempted to solve the problem of ethnic diversity by the elimination or expulsion of ethnic groups—notable examples being the Nazi policy against the Jews during World War II, the expulsion of the Moors and Jews from 15th-century Spain, or the expulsion of the Arabs and East Indians from several newly independent African countries in the 1960s and '70s.

More common solutions have been assimilation or acculturation, whether forced, induced, or voluntary. Forced assimilation was imposed in early modern times by the English conquerors, themselves an amalgam of Saxon and

Norman elements, when they suppressed the native language and religion in the Celtic lands of Wales, Scotland, and Ireland. Similar methods were employed by their French contemporaries as they extended their conquests into the *langue d'oc* region of southern Europe. Through considerably less brutal methods, the Chinese ethnic groups in Thailand and Indonesia have been legally induced to adopt the dominant culture through a process called "directed acculturation."

A variant of this process has been the more or less voluntary assimilation achieved in the United States under the rubric of "Americanization." This is largely a result of the unusual opportunities for social and economic mobility in the United States and of the fact that for the European ethnic groups, in contrast to the racial minorities, residence in the United States was a matter of individual or familial choice, not conquest or slavery. But both public policy and public opinion also contributed to American assimilation.

Another way of dealing with ethnic diversity, one that holds more promise for the future, is the development of some form of pluralism, which usually rests on a combination of toleration, interdependence, and separatism. One of the most notable long-term solutions has been that of Switzerland, where the three major ethnic groups are concentrated in separate cantons, each enjoying a large measure of local control within a democratic federation. Another, less stable federal pluralism is found in Canada, where the French Catholic province of Quebec is increasingly assertive about its desire for complete independence and forced acculturation of its own ethnic minorities.

ethnobotany, systematic study of the botanical knowledge of a social group and its use of locally available plants in foods, medicines, clothing, or religious rituals. Rudimentary drugs derived from plants used in folk medicines have been found to be beneficial in the treatment of many illnesses, both physical and mental. The ethnobotany of prehistoric cultures is discovered through examination of ancient writings, pictures, pottery, and plant remains in jars or midden heaps (garbage dumps) excavated at archaeological sites.

ethnography, descriptive study of a particular human society or the process of making such a study. Contemporary ethnography is based almost entirely on fieldwork and requires the complete immersion of the anthropologist in the culture and everyday life of the people who are the subject of his study.

There has been some confusion regarding the terms ethnography and ethnology. The latter, a term more widely used in Europe, encompasses the analytical and comparative study of cultures in general, which in American usage is the academic field known as cultural anthropology (in British usage, social anthropology). Increasingly, however, the distinction between the two is coming to be seen as existing more in theory than in fact. Ethnography, by virtue of its intersubjective nature, is necessarily comparative. Given that the anthropologist in the field necessarily retains certain cultural biases, his observations and descriptions must, to a certain degree, be comparative. Thus the formulating of generalizations about culture and the drawing of comparisons inevitably become components of ethnography.

The description of other ways of life is an activity with roots in ancient times. Herodotus, the Greek traveler and historian of the 5th century BC, wrote of some 50 different peoples he encountered or heard of, remarking on their laws, social customs, religion, and appearance. Beginning with the age of exploration and continuing into the early 20th century, detailed accounts of non-European peoples were

rendered by European traders, missionaries, and, later, colonial administrators. The reliability of such accounts varies considerably, as the Europeans often misunderstood what they saw or had a vested interest in portraying their subjects less than objectively.

Modern anthropologists usually identify the establishment of ethnography as a professional field with the pioneering work of the Polish-born British anthropologist Bronisław Malinowski in the Trobriand Islands of Melanesia (c. 1915). Ethnographic fieldwork has since become a sort of rite of passage into the profession of cultural anthropology. Many ethnographers reside in the field for a year or more, learning the local language or dialect and, to the greatest extent possible, participating in everyday life while at the same time maintaining an observer's objective detachment. This method, called participant-observation, while necessary and useful for gaining a thorough understanding of a foreign culture, is in practice quite difficult. Just as the anthropologist brings to the situation certain inherent, if unconscious, cultural biases, so also is he influenced by the subject of his study. While there are cases of ethnographers who felt alienated or even repelled by the culture they entered, many—perhaps most—have come to identify closely with "their people," a factor that affects their objectivity. In addition to the technique of participant-observation, the contemporary ethnographer usually selects and cultivates close relationships with individuals, known as informants, who can provide specific information on ritual, kinship, or other significant aspects of cultural life. In this process also the anthropologist risks the danger of biased viewpoints, as those who most willingly act as informants frequently are individuals who are marginal to the group and who, for ulterior motives (e.g., alienation from the group or a desire to be singled out as special by the foreigner), may provide other than objective explanations of cultural and social phenomena. A final hazard inherent in ethnographic fieldwork is the ever-present possibility of cultural change produced by or resulting from the ethnographer's presence in the group.

Contemporary ethnographies usually adhere to a community, rather than individual, focus and concentrate on the description of current circumstances rather than historical events. Traditionally, commonalities among members of the group have been emphasized, though recent ethnography has begun to reflect an interest in the importance of variation within cultural systems. Ethnographic studies are no longer restricted to small primitive societies but may also focus on such social units as urban ghettos. The tools of the ethnographer have changed radically since Malinowski's time. While detailed notes are still a mainstay of fieldwork, ethnographers have taken full advantage of technological developments such as motion pictures and tape recorders to augment their written accounts.

ethnolinguistics, that part of anthropological linguistics concerned with the study of the interrelation between a language and the cultural behaviour of those who speak it. Several controversial questions are involved in this field: Does language shape culture or vice versa? What influence does language have on perception and thought? How do language patterns relate to cultural patterns? These questions, which had been posed earlier by the German scholars Johann Gottfried von Herder and Wilhelm von Humboldt and their followers in the idealist-romanticist tradition, emerged again in the United States as a result of the discovery of the vastly different structure of American Indian languages, as delineated by the American anthropological linguists Edward Sapir and Benjamin L. Whorf. They noticed, for example, that Eskimo has many words for snow, whereas Aztec em-

ploy a single term for the concepts of snow, cold, and ice. The notion that the structure of a language conditions the way in which a speaker of that language thinks is known as the Whorfian hypothesis, and there is much controversy over its validity.

ethnomusicology, scientific study of music in any world culture or subculture in terms of its actual sounds and performance practices, in its relation to the specific culture, and in comparison with other cultures. The field was originally called comparative musicology in the 1880s by scholars concerned with the measurement of pitches, anthropological data, museum archiving, or the study of exotic music.

Jaap Kunst, a Dutch expert in Indonesian music, created the term ethnomusicology in the 1950s, and in 1956 an ethnomusicology society was founded, consisting of musicians and anthropologists interested in world music. In the spirit of the preceding definition, the field has continued to expand so that such topics as Japanese art music, New Guinean tribal music, African court music, English folk songs, jazz, and the social and financial structure of European-American popular music can be found in its studies.

ethology, the study of animal behaviour. Although many naturalists have studied aspects of animal behaviour through the centuries, the modern science of ethology is usually considered to have arisen as a discrete discipline with the work in the 1920s of biologists Nikolaas Tinbergen of The Netherlands and Konrad Lorenz of Austria. Ethology is a combination of laboratory and field science, with strong ties to certain other disciplines—e.g., neuroanatomy, ecology, evolution. The ethologist is interested in the behavioral process rather than in a particular animal group and often studies one type of behaviour (e.g., aggression) in a number of unrelated animals.

ethrog (Jewish ritual plant): *see* etrog.

ethyl acetoacetate, also called **ACETOACETIC ESTER** ($\text{CH}_3\text{COCH}_2\text{COOC}_2\text{H}_5$), an ester widely used as an intermediate in the synthesis of many varieties of organic chemical compounds. Industrially it is employed in the manufacture of synthetic drugs and dyes.

The ester is produced chiefly by self-condensation of ethyl acetate, brought about by sodium metal. It readily forms sodium derivatives that can be alkylated and dialkylated. The resulting esters may be converted to ketones or carboxylic acids. Ethyl acetoacetate readily enters into condensation reactions, and it has been employed in the synthesis of pyridines, quinolines, furans, pyrazoles, pyrroles, and purines.

The pure ester is a colourless, fragrant liquid, boiling with slight decomposition at 180.4°C under a pressure of 760 mm.

ethyl alcohol, also called **ETHANOL**, **GRAIN ALCOHOL**, or **ALCOHOL**, the most important member of a class of organic compounds that are given the general name alcohols; its molecular formula is $\text{C}_2\text{H}_5\text{OH}$. It is the intoxicating ingredient of many beverages produced by fermentation.

There are three main processes for the manufacture of ethanol: the fermentation of carbohydrates, the hydration of ethylene, and the reduction of acetaldehyde (commonly prepared by the hydration of acetylene). Before 1930 all ethanol was prepared by fermentation process, which still remains the most important method in most countries. In the United States, 70 to 90 percent of the total output of ethanol is now produced by hydration of ethylene, however. The fermentation process involves the transformation of carbohydrates to ethanol by growing yeast cells. The chief raw materials for this process are molasses and corn (maize). The hydration of ethylene

is achieved by passing a mixture of ethylene and a large excess of steam.

Ethanol produced either by fermentation or by synthesis is obtained as a dilute aqueous solution and must be concentrated by fractional distillation. Direct distillation can yield at best the constant-boiling-point mixture containing 95.6 percent by weight of ethanol. Dehydration of the constant-boiling-point mixture yields anhydrous, or absolute, alcohol. Because ethyl alcohol for beverage purposes is subject to tax in all countries, ethyl alcohol for industrial purposes must be rendered unfit to drink (denatured) to escape taxation. Typical denaturants that are mixed with ethyl alcohol are methanol, camphor, benzene, and kerosene.

Pure ethanol is a colourless, flammable liquid (boiling point 78.5°C [173.3°F]) with an agreeable ethereal odour and a burning taste. Ethanol is toxic, affecting the central nervous system. Moderate amounts stimulate the mind and relax the muscles, but larger amounts impair coordination and judgment, finally producing coma and death. It is an addictive drug for some persons, leading to the disease alcoholism.

Ethyl alcohol is converted in the body first to acetaldehyde and then to carbon dioxide and water, at the rate of about 0.75 ounce per hour; this quantity corresponds to a dietary intake of about 200 calories.

ethyl chloride, also called **CHLOROETHANE**, colourless, flammable, mobile liquid of low boiling point, belonging to the family of organic halogen compounds and principally used in the manufacture of tetraethyl lead; it has uses as a solvent, a refrigerant, and an anesthetic and in the production of other organic chemicals. For use in medicine as an anesthetic, it is prepared from hydrogen chloride and ethyl alcohol; its chemical formula is $\text{C}_2\text{H}_5\text{Cl}$. Although a gas at room temperature, ethyl chloride is stored and sold under pressure in glass bottles fitted with trigger-controlled spray nozzles as a colourless, mobile liquid with a sweet, burning taste and a characteristic odour resembling that of ether.

It has been used as a local anesthetic for small incisions, tooth extractions, and needle punctures by spraying it on the surface of the skin or mucous membrane in a fine stream, with particular care that the end of the spray stream is focused upon the point to be frozen. Its rapid evaporation causes local freezing (-35°C can be obtained).

As a general anesthetic, it is usually given in doses of 3 to 5 cubic cm in a closed inhaler. Short administrations produce an anesthesia similar to that of nitrous oxide, with equally rapid loss of consciousness, quick recovery, and slight aftereffects. It is suitable only for short operations because it does not produce the desired muscular relaxation effected by chloroform for protracted operations. Ethyl chloride has been recommended for anesthesia of short duration because it is less dangerous than, and as satisfactory as, nitrous oxide. Its effect on the circulatory and respiratory systems is slightly stimulating, causing slight acceleration of the pulse rate and deeper and more rapid breathing.

Pure ethyl chloride boils at 12.3°C (54.1°F) and freezes at -138.7°C (-217.7°F); it dissolves freely in alcohol, ether, and other organic solvents but only slightly in water.

Preparation of tetraethyl lead is based on the reaction of ethyl chloride with an alloy of sodium and lead, forming sodium chloride as a by-product. Ethylcellulose, a component of lacquers and plastics, is made from ethyl chloride and cellulose.

ethyl ether, also called **DIETHYL ETHER**, well-known anesthetic, commonly called sim-

ply ether, an organic compound belonging to a large group of compounds called ethers; its molecular structure consists of two ethyl groups linked through an oxygen atom, as in $C_2H_5OC_2H_5$.

Ethyl ether is a colourless, volatile, highly flammable liquid (boiling point $34.5^\circ C$ [$94.1^\circ F$]) with a powerful, characteristic odour and a hot, sweetish taste. It is a widely used solvent for bromine, iodine, most fatty and resinous substances, volatile oils, pure rubber, and certain vegetable alkaloids.

Ethyl ether is manufactured by the distillation of ethyl alcohol with sulfuric acid. Pure ether (absolute ether), required for medical purposes and in the preparation of Grignard reagents, is prepared by washing the crude ether with a saturated aqueous solution of calcium chloride, then treating with sodium.

ethylene, the simplest member of the olefinic hydrocarbon series and one of the most important raw materials of the organic chemical industry; chemical formula, $CH_2=CH_2$. It occurs in both petroleum and natural gas, but the bulk of the industrial material is produced by heating of higher hydrocarbons. Numerous large-scale processes have been developed, using raw materials ranging from ethane to whole crude oil; in the U.S., ethane and ethane-propane mixtures are commonly used.

Ethylene undergoes polymerization (combination of small molecules to form large molecules) to polyethylene, a plastic material having many uses, particularly in packaging films, wire coatings, and squeeze bottles. The polymerization may be carried out at high pressures and temperatures or by the more recently introduced Ziegler process, which uses a catalyst. With sulfuric acid, ethylene forms a mixture of sulfates that can be hydrolyzed to ethyl alcohol; it combines with chlorine or bromine to yield the corresponding ethylene dihalides, useful solvents and gasoline additives. The reaction of ethylene and oxygen gives ethylene oxide, used in the manufacture of antifreeze, detergents, and other derivatives. Ethylene and benzene combine to form ethylbenzene, which is dehydrogenated to styrene for use in the production of plastics and synthetic rubber.

In botany, ethylene is a plant hormone that inhibits growth and promotes leaf fall. In fruit, however, ethylene is regarded as a ripening hormone. Involved in its action in fruit is some other factor that influences ethylene sensitivity of the tissues.

Pure ethylene is a colourless, flammable gas having a sweetish taste and odour; it freezes at $-169.4^\circ C$ ($-272.9^\circ F$) and boils at $-103.9^\circ C$ ($-155.0^\circ F$).

ethylene bromide, also called ETHYLENE DIBROMIDE, or 1,2-DIBROMOETHANE, a colourless, sweet-smelling, nonflammable, toxic liquid belonging to the family of organic halogen compounds, principally used in conjunction with lead-containing anti-knock agents as a component of gasoline.

Ethylene bromide is manufactured by the reaction of ethylene with bromine. It is denser than water and very slightly soluble in it but is soluble in many organic liquids. Its use in internal-combustion engines derives from its ability to convert nonvolatile lead compounds into lead bromide, which vaporizes at the high temperatures in the combustion chamber and is swept out in the exhaust gases.

ethylene chloride, also called ETHYLENE DICHLORIDE, or 1,2-DICHLOROETHANE, a colourless, toxic, volatile liquid belonging to the family of organic halogen compounds and having an odour resembling that of chloroform. It was formerly important as a solvent and as a raw material for making ethylene

glycol and polysulfide rubbers, but now it is principally used for making vinyl chloride and as a component of tetraethyllead anti-knock formulations for gasoline.

Ethylene chloride is produced by the reaction of ethylene and chlorine; it is denser than water and practically insoluble in it. It is an effective solvent for fats, waxes, greases, and numerous other organic compounds, but its use as a solvent has been largely discontinued in favour of tetrachloroethylene.

Ethylene chloride is converted to vinyl chloride (an important raw material for plastics) by contact with a catalyst at about $500^\circ C$ ($900^\circ F$) or by reaction with dilute caustic alkali at about $150^\circ C$ ($300^\circ F$). The use of ethylene chloride with tetraethyllead depends upon its ability to prevent the accumulation of lead compounds within the engine by converting them into lead chloride, which is sufficiently volatile to be vaporized and carried away in the exhaust gases.

ethylene glycol, simplest member of the glycol family of organic compounds (see glycol).

ethyne (chemistry): see acetylene.

Étienne (French personal name): see under Stephen.

etiquette, system of rules and conventions that regulate social and professional behaviour. In any social unit there are accepted rules of behaviour upheld and enforced by legal codes; there are also norms of behaviour mandated by custom and enforced by group pressure. An offender faces no formal trial or sentence for breach of etiquette; the penalty lies in the disapproval of other members of the group. Regardless of its level of material culture, any highly stratified society will possess an etiquette in which every person knows the behaviour expected from him toward others and from others toward himself.

The royal court was the natural home of etiquette, because it centred upon a monarch around whom niceties of behaviour spread in expanding circles. The author of *Beowulf*, writing of Anglo-Saxon society, describes Wealtheow the queen, "mindful of etiquette," carrying the goblet first to the king, then to the courtiers, in a clearly defined order of precedence.

The Middle Ages was a golden period for Western etiquette, since the feudal system was strictly stratified. Jean Froissart in his *Chronicle* speaks of the Black Prince waiting at table upon the captive king John of France, after the Battle of Poitiers.

In Britain standards of conduct were greatly affected by the publication in the 16th century of certain Italian works known as courtesy books. Probably the most influential of these was Baldassare Castiglione's *Il libro del cortegiano* (1528; *The Book of Courtesy*, 1561). Further elaborations by English authorities—e.g., Richard Brathwaite's *The English Gentleman* and *Description of a Good Wife*—arrived in colonial America with passengers of the "Mayflower." These British imports were soon followed by such indigenous products as the manual for parents entitled *School of Good Manners* (attributed to Eleazar Moody, 1715).

The late 18th and early 19th centuries showed another great flowering of etiquette in Britain when exquisites like Beau Nash and Beau Brummell imposed their whims as rules upon polite society; even the Prince Regent would not leave his waistcoat unbuttoned to a greater degree than Brummell prescribed. In the late 19th and early 20th centuries those in the upper strata of society regarded the observance of the most trivial demands of etiquette as at once a diversion and, for the women, an occupation. More and more elaborate rituals were designed to create a sense of exclusiveness for the initiates and to keep the unworthy, ignorant of them, at a distance.

By mid-20th century, however, concern about polite conduct was no longer confined to a social elite. Good manners for ordinary people in everyday situations were set forth in the United States by two prominent and influential arbiters of taste, Emily Post and Amy Vanderbilt. Drawing on her own wide experience in social, political, and diplomatic situations, no less a personage than Eleanor Roosevelt published her own typically practical *Book of Common Sense Etiquette* (1962).

World wars and increasing social equality resulted in a simpler code, appropriate to the faster tempo and less pampered conditions of life in society. Nonetheless, etiquette remains active on royal or ceremonial occasions and in the more formal aspects of professional or communal life. No rule of law or principle of morality decrees that a soup plate should be tilted away from, never toward, the diner, or that (in Great Britain) a surgeon shall be known as "Mr." while a physician is addressed as "Dr.," but etiquette ordains it. Since the framework and content of the communities of which society is formed are constantly changing, the habits of etiquette can and do change with them.

Etna (Mount), Latin AETNA, Sicilian MONGIBELLO, active volcano on the east coast of Sicily. The name comes from the Greek Aitne, from *aitnō*, "I burn." Etna is the highest active volcano in Europe, its topmost elevation being more than 10,000 ft (3,200 m). Like other active volcanoes, its height varies: in 1865, for example, the volcanic summit was 170 ft higher than it was in the late 20th century. Etna covers an area of 600 sq mi (1,600 sq km); its base has a circumference of about 93 mi (150 km).

Its geological characteristics indicate that Etna has been active since the end of the Tertiary Period, somewhat more than 2,500,000 years ago. The volcano has had more than one active centre. A number of subsidiary cones have been formed on lateral fissures extending out from the centre and down the sides. The present structure of the mountain is the result of the activity of at least two main eruptive centres.

The Greeks created legends about the volcano, saying that it was the workshop of Hephaestus and the Cyclops or that underneath it the giant Typhon lay, making the Earth tremble when he turned. The ancient poet Hesiod spoke of Etna's eruptions, and the Greeks Pindar and Aeschylus referred to a famous eruption of 475 bc. From 1500 bc to ad 1669 there are records of 71 eruptions, of which 14 occurred before the Christian Era. The most violent historical eruption was in 1669 (March 11–July 15), when about 990,000,000 cu yd (830,000,000 cu m) of lava were thrown out. The eruption took place along a fissure that opened above the town of Nicolosi, widening into a chasm from which lava flowed and solid fragments, sand, and ashes were hurled. The latter formed a double cone more than 150 ft high, named Monti Rossi. The lava flow destroyed a dozen villages on the lower slope and submerged the western part of the town of Catania. Efforts to divert the lava stream away from Catania were made by workers who dug a trench above the village. Historically, this seems to have been the first attempt to divert a lava stream. Between 1669 and 1900, 26 more eruptions were reported. During the 20th century there have been eruptions in 1908, 1910, 1911, 1918, 1923, 1928, 1942, 1947, 1949, 1950, 1955, and 1971. Activity was almost continuous in the decade following 1971, and in 1983 an eruption that lasted four months prompted authorities to explode dynamite in an attempt to divert lava flows.

Among Etna's better known ancient eruptions was that of 396 bc, which kept the Carthaginian army from reaching Catania. An

eruption of 1381 sent a lava flow as far as the sea. The eruption of 1852 took many lives. That of 1928 cut off the railway that runs around the base of the mountain and buried the village of Mascali. That of 1971 threatened several villages with its lava flow and destroyed some orchards and vineyards.

The mountain has three ecological zones, one above the other, each exhibiting its own characteristic vegetation. The lowest zone, sloping gradually upward to perhaps 3,000 feet (915 m), is fertile and rich in vineyards, olive groves, citrus plantations, and orchards. Several densely populated settlements, notably the city of Catania, are found on the lower slopes, but they become less frequent as the height increases. Above, the mountain grows steeper and is covered with forests of chestnut, beech, oak, pine, and birch. At heights of more than 6,500 feet (1,980 m), the mountain is covered with ashes, sand, and fragments of lava and slag; there are a few scattered plants such as *Astragalus aetnensis* (local name: spino santo), which forms typical bushes almost 1 yard (about 0.9 m) high, while some alpine plants manage to survive even near the top. Algae have been found near the steam outlets at 9,800 feet (2,990 m).

Etna has been studied systematically since the mid-19th century, and three observatories have been set up on its slopes at Catania, Casa Etna, and Cantoniera.

Etō Shimpei (b. March 18, 1834, Hizen province, Japan—d. April 13, 1874, Saga prefecture, Kyushu), statesman who played a leading role in the Meiji Restoration (the 1868 return of power to the emperor and overthrow of the Tokugawa shogunate).

Although Etō was not a native of Chōshū or of Satsuma, the two feudal fiefs that played the leading role in the Meiji Restoration, he was responsible for the support given the imperial forces by troops from his native domain of Saga. After the 1868 coup he became an important member of the new government and was partially responsible for the transfer of the imperial capital from Kyōto to Edo, renamed Tokyo. He then assisted in setting up a new civil administration and public-finance system and initiated the reform of the old judicial apparatus.

In 1873, however, Etō was a member of a faction within the cabinet that advocated a military expedition against Korea. When this idea was rejected, Etō resigned from the cabinet and helped form a political club, the Aikoku Kōtō ("Public Party of Patriots"). Angered by the domination of the government by samurai (hereditary warriors) from Chōshū and Satsuma, the group denounced the arbitrary manner in which official decisions were being made and called for the establishment of a parliamentary system of government.

When the administration ignored these suggestions, Etō returned to Saga, where he organized a revolt, the first serious challenge to the new government. Dissident samurai in other provinces failed to rally to Etō's cause, however, and he was captured and beheaded.

Etobicoke, former city (1967–98), southeastern Ontario, Canada. In 1998 it was amalgamated with the cities of North York, Scarborough, York, and Toronto and the borough of East York to become the City of Toronto. Etobicoke was established in 1967 through amalgamation of the township of Etobicoke (incorporated 1851) and several municipalities. The name Etobicoke, derived from an Indian word meaning "place where the alders grow," was originally given to Etobicoke Creek. There are about 1,600 acres (650 ha) of parks. Industries are diversified and include a large tire plant and rubber plant. Area 48 square miles (124 square km). Pop. (2001) 338,117.

Eton, town ("parish"), Windsor and Maidenhead unitary authority, historic county of

Buckinghamshire, England, across the River Thames from Windsor. It is renowned for Eton College, the largest of the great public (independent) schools of England. Pop. (2001) Windsor/Eton, 30,568.

Eton College, in Eton, Windsor and Maidenhead unitary authority, largest public school (independent secondary school) in England and one of the highest in prestige. It was founded by Henry VI in 1440–41 for 70 highly qualified boys who received scholarships from a fund endowed by the king. Simultaneously, Henry founded King's College, Cambridge, to which scholars from Eton were to proceed. The connection is continued as a number of scholarships there are offered to Etonians.

Eton College from the playing fields
Popperfoto

Today, as throughout the school's history, Eton names 70 King's Scholars, or Collegers, each year based on the results of a competitive examination open to boys between 12 and 14 years of age. The King's Scholars are boarded in special quarters in the college. Beginning in the 1970s, Eton began offering additional scholarships, including junior and music scholarships. In 2003 it introduced American Scholars. Today, most scholars pay some fees.

The other students, called Oppidans, now number about 1,200 and are housed in boardinghouses under the care of house masters. The Oppidans generally come from England's wealthiest and most prestigious families, many of them aristocratic. Boys enter Eton at about age 13 and continue there until they are ready to enter university. Famous alumni include Sir Robert Walpole, William Pitt (the Elder), William Gladstone, John Maynard Keynes, and Prince William of Wales.

Etosha Pan, extremely flat salt pan, northern Namibia, covering an area of approximately 1,900 square miles (4,800 square km) at an elevation of about 3,400 feet (1,030 m). This enormous expanse of salt, glimmering green in the dry season, is the largest of its kind in Africa. It was first discovered by Europeans when Sir Francis Galton and Charles Anderson sighted it in 1851. There is geological evidence that the Kunene River of Angola formerly flowed southward into the pan, forming a huge lake. Later the river changed its course westward to the Atlantic Ocean, and the lake, deprived of its inflow, shrank in size, the water evaporating to form the salt pan, or salina. There are lone salt springs on the pan that have built up little hillocks of clay and salt used by animals as salt licks. The pan is fed by a number of nearly parallel channels (*oshanas*) extending north into Angola that in the monsoon season from December to March fill parts of Etosha ("Place of Mirages") and surrounding areas with rainwater pools.

The Etosha Pan is the centre of Etosha National Park, which has an area of 8,598 square miles (22,269 square km) and one of the largest accumulations of big-game species in the world, including lions, elephants, rhinoceros, elands, zebras, and springbok. Abundant bird life includes flamingos, vultures, hawks, eagles, ostriches, guinea fowl, and geese. The eastern portion of Etosha National Park has a tree-savanna type of vegetation (abounding in tambouti [a deciduous tree that

is locally used for furniture and cabinetwork], wild fig, and date palms); moringa trees are typical of the more arid thorn-shrub savanna of the western part of the park. The German colonial fort of Namutoni (originally built in 1901, destroyed in 1904, and reconstructed between 1905 and 1907), at the eastern end of the pan, resembles a fort of the French Foreign Legion. It has been restored for use as a tourist camp for Etosha National Park. A severe drought and warfare between a guerrilla organization, the South West Africa People's Organization (SWAPO), and South African troops decimated a great deal of the national park's big-game population in the late 1970s and early 1980s.

not letter by letter

etrog, also spelled ETHROG, or ESROG (Hebrew: "citron"), plural ETROGIM, ETHROGIM, ESROGIM, ETROGS, ETHROGS, or ESROGS, one of four species of plants used during the Jewish celebration of Sukkoth (Feast of Booths), a festival of gratitude to God for the bounty of the earth that is celebrated in autumn at the end of the harvest festival. For ritual purposes the etrog must be perfect in stem and body. It is generally placed in an ornate receptacle and was at one time widely used as a symbol of Judaism.

The other ritual plants used for Sukkoth are a palm branch, or lulab (*lulav*), myrtle (*hadass*), and willow (*arava*). The etrog is

Etrog, lulab, myrtle, and willow held by a child; detail of "Sukkoth," painting by Isidor Kaufmann; in the Jewish Museum, New York

held in the left hand during the service while the right hand holds the palm branch with myrtle and willow entwined. On the seventh day of Sukkoth the four species are carried seven times around the synagogue. During the singing of specified Psalms (Hallel), the etrog and lulab are waved upward and downward and toward the four points of the compass to indicate the omnipresence of God.

Etruscan, member of an ancient people of Etruria, in Italy (between the Tiber and Arno rivers west and south of the Apennines), whose urban civilization reached its height in the 6th century BC. Many features of Etruscan culture were adopted by the Romans, their successors to power in the peninsula.

A brief treatment of the Etruscans follows. For full treatment, see MACROPAEDIA: Greek and Roman Civilizations, Ancient.

The origin of the Etruscans has been a subject of debate since antiquity. Herodotus, for example, argued that the Etruscans descended from a people who invaded Etruria from Anatolia before 800 BC and established themselves over the native Iron Age inhabitants of the region, whereas Dionysius of Halicarnassus believed that the Etruscans were of local Italian origin. Both theories, as well as a third 19th-century theory, have turned out to be problematic, and today scholarly discussion has shifted its focus from the discussion of provenance to that of the formation of the Etruscan people.

In any event, by the middle of the 7th century BC the chief Etruscan towns had been founded. Before reaching the Arno River in the north and incorporating all Tuscany in their dominion, the Etruscans embarked upon a series of conquests initially probably not coordinated but undertaken by individual cities. The pressing motive for expansion was that by the middle of this century the Greeks not only had obtained a grip on Corsica and expanded their hold on Sicily and southern Italy but also had settled on the Ligurian coast (northwestern Italy) and in southern France.

Etruscan expansion to the south and east was confined at the line of the Tiber River by the strong Italic Umbrian people settled beyond it on the south and the Picenes on the east. To the northeast no such united power opposed their expansion, since the Apennine mountains in Aemilia (modern Emilia) and Tuscany were held by scattered Italic tribes. Through these the Etruscans were able, in the middle of the 6th century, to push into the Po River valley.

As capital of this northward region they established the old Villanovan centre at Bologna (the Etruscan city of Felsina) and on the banks of the Reno founded Marzabotto. On the Adriatic coast to the east, Ravenna, Rimini (ancient Ariminum), and Spina traded with Istria (ancient Istra) and the Greek Dalmatian colonies. From the Po valley, contacts were made with the central European La Tène cultures. Etruscan conquests in the northeast extended to include what are now the modern cities of Piacenza, Modena, Parma, and Mantua. To the south they were drawn into Latium and Campania from the end of the 7th century, and in the 6th century they had a decisive impact on the history of Rome, where the Etruscan dynasty of the Tarquins is said to have ruled from 616 to 510/509 BC. It is possible that the Roman Tarquins were connected with a family called Tarchu, which is known from inscriptions.

Rome before the Etruscan advent was a small conglomeration of villages. It was under the new masters that, according to tradition, the first public works such as the walls of the Capitoline hill and the Cloaca Maxima (a sewer) were constructed. Considerable evidence of the Etruscan period in Rome's history has come to light in the region of the Capitol. That there were rich tombs in Rome itself cannot be doubted—tombs similar to those in the Latin town of Praeneste (modern Palestrina).

Meanwhile, by the beginning of the 6th century the Etruscans had included Fiesole (ancient Faesulae) and Volterra (ancient Volaterrae) in their northern limits and at the same

time began to push southward into Campania. Capua became the chief Etruscan foundation in this region and Nola a second; a necropolis has been found in the Salerno region and Etruscan objects in low levels at Herculaneum and Pompeii. The coastal region was still, however, in Greek hands. When the Etruscans attacked the Greek foundation of Cumae in 524 BC, their advance was finally checked by their defeat at the hands of Aristodemus of that city.

The rivalry between Greek trade in the western Mediterranean and that carried on between the Etruscans and Carthage had already come to a head at the battle of Alalia in 535 BC, a battle which the Greeks claimed to have won but which so upset them that they determined to abandon Corsica to Etruscan and Carthaginian influence.

In the last quarter of the 6th century, when Etruscan power was at its height from the Po to Salerno, small settlements of Etruscans might have been planted beyond these limits. At Spoleto (ancient Spoletium) in the north and Fossombrone in Liguria their power was not, however, to last long; Cumae felt the first of sharp waves of resistance coming from Greeks, Samnites, Romans, and Gauls. In 509 BC the Etruscans were chased from Rome, as reflected in the story of the expulsion of Tarquinius Superbus, the intervention of Lars Porsena of Clusium, and the Latin victory over Aruns Porsena's son at Aricia. When Latium was lost, relations between Etruria and its Campanian possessions were broken with disastrous effect. A series of piecemeal feuds between Etruscan cities and Rome led to the incorporation of the former into the Roman sphere—first the nearby town of Veii in 396 BC, after which Capena, Sutri, and Nepes (modern Nepes) fell in turn, thus beginning the end of the first of many unsuccessful attempts at unifying Italy.

Nevertheless, the Etruscans had established a thriving commercial and agricultural civilization. Characteristic of their artistic achievements are the wall frescoes and realistic terra-cotta portraits found in their tombs. Their religion employed elaborately organized cults and rituals, including the extensive practice of divination.

"De," "la," and similar components of a name, when followed by a space, are alphabetized as separate words (e.g., De Forest, Lee). When they are joined to the following part of a name, the combination is treated as a single word (e.g., DeForest, John William).

Etruscan alphabet, writing system of the Etruscans, derived from a Greek alphabet (originally learned from the Phoenicians) as early as the 8th century BC. It is known to modern scholars from more than 10,000 inscriptions.

Like the alphabets of the Middle East and the early forms of the Greek alphabet, the Etruscan script was usually written from right to left but occasionally appears in *boustrophedon* style (*i.e.*, the direction of writing alternates with each line, right-to-left/left-to-right). The alphabet went through many changes in form and composition over the course of time; it achieved its final ("classical") form about 400 BC, with 20 letters—four vowels (*a, e, i, u*) and 16 consonants—a reduction from earlier forms with 26 letters (*c.* 700 BC) and 23 letters (5th century BC). The script continued to be written in its classical form until at least the 1st century AD. The Etruscan language ceased to be spoken in the time of imperial Rome but continued to be used in a religious context until late antiquity. The Etruscan writing system gave rise to the other Italic alphabets, including the Latin alphabet, which finally replaced it.

Etruscan art, the sculpture, architecture, painting, and other visual and decorative art forms as practiced by the ancient Etruscans.

Etruscan art is treated in a number of articles in the MACROPAEDIA. For a general discussion of ancient Etruscan culture within its historical context, see Greek and Roman Civilizations, Ancient: *Ancient Italic peoples*. For treatment of Etruscan achievements in specific art forms, see Architecture, The History of Western: *Western Mediterranean*; Decorative Arts and Furnishings; Painting, The History of Western: *Western Mediterranean*; Sculpture, The History of Western: *Western Mediterranean*.

Etruscan language, language spoken by the ancient Etruscan people of Etruria (now largely Tuscany and sections of Lazio and Umbria) in Italy, who were early neighbours of the Romans. Etruscan does not seem to be an Indo-European language, although it was apparently influenced in its latest formative developments by that language family.

A brief treatment of the Etruscan language follows. For full treatment, see MACROPAEDIA: Languages of the World.

The Etruscan language is known mainly from epigraphic records dating from the 7th century BC to the first years of the Christian Era. There are some 10,000 of these inscriptions, mainly brief and repetitious epitaphs or dedicatory formulas. However, there are some exceptions to the general brevity of the inscriptions, found in a variety of places. One example includes a text of 281 lines written on strips of linen cloth. These had originally been a book, which, however, was cut into strips and used in Egypt as a wrapping for a mummy. Another example is a bronze model of a sheep's liver found at Piacenza and probably representing the Etruscan microcosm in a form used for instruction in divination; it has 45 words on it.

Despite many attempts at decipherment and some claims of success, the Etruscan records still defy translation. For some words, however, the grammatical category has been established, and for fewer still, a meaning has been assigned. The fact that Etruscan writing has an alphabet derived from one of the Greek alphabets is important because sound values can then be assigned with some degree of precision to each symbol. A marked tendency to make all vowels in a word similar or identical is characteristic: Greek *Klutaimēstra*, which if transliterated directly into Etruscan would be *clutimnestha*, actually occurs as *clulumustha* and *clumsta*. Greek *Alexandros* appears as *elchsnre*. The consonant cluster of *elchsnre*, while extreme, is not untypical of Etruscan spelling; words thus written have led some to suggest that a very economical spelling system may have been used that was far removed from the reality of pronunciation.

In earliest times Etruscan had no word division or punctuation. In about the 6th century BC a system of dots, consisting of four, three, or two dots inscribed vertically, was introduced to mark word boundaries and, in some instances, to indicate syllables and abbreviations.

Etterbeek, municipality, Brabant province, central Belgium. First mentioned in the early 12th century, Etterbeek is one of the 19 suburban communes that, with Brussels proper, make up Greater Brussels. Primarily industrial, it has chemical, clothing, metalwork, machinery, and furniture manufacturing. There is a large army barracks in the southeast section bordering the new campus of the Free University of Brussels. Pop. (2000 est.) mun., 39,404.

Ettlingen, city, Baden-Württemberg Land (state), southwestern Germany, on the Alb River, just south of Karlsruhe.

Originally a Roman settlement, it belonged

to Weissenburg Abbey in the early European Middle Ages, it was chartered in 1192, and it passed to Baden in 1219. It was severely damaged by fire in 1689, and most of its notable buildings date from the 18th century, including the former palace of the margraves (its chapel has frescoes by the brothers C.D. and E.Q. Asam) and the town hall. Of the numerous Roman relics, the best known is the "Neptune" sculpture in the wall of the town hall. Ettlingen has textile and paper industries. Pop. (1998 est.) 38,576.

Ettrick and Lauderdale, former district (1975–96) of the former Borders region, southern Scotland. The region is now part of the unitary council area of Scottish Borders (*q.v.*).

Etty, William (b. March 10, 1787, York, Yorkshire, Eng.—d. Nov. 13, 1849, York), one of the last of the English academic history painters.

In 1807 he was admitted to the Royal Academy schools, and by 1818 he had developed considerable talent as a portraitist. The grand but simply conceived "Combat" (1825) brought him his first great success. During the last decade of his life, bad health, economic pressure, and unenlightened patronage forced him to concentrate on minor pieces that sold easily. His nude studies, which date from this period, are still admired.

étude (French: "study"), in music, originally a study or technical exercise, later a complete and musically intelligible composition exploring a particular technical problem in an esthetically satisfying manner. Although a number of didactic pieces date from earlier times, including vocal solfeggi and keyboard works (Domenico Scarlatti's *Esercizi per gravicembalo*), the étude came into its own only in the late 18th and early 19th centuries with collections published by the virtuoso pianist Muzio Clementi (especially his *Grados ad Parnassum*, 1817), emulated by other pianist-composers, including Johann Baptist Cramer, Henri Bertini, and especially Karl Czerny. With the 27 piano études by Chopin, the étude became a composition of considerable musical interest apart from its merit as a technical study; Claude Debussy's *Douze Études* (1915; *Twelve Études*) is a notable later example.

The violin étude, less cultivated than the piano étude, is represented in a number of collections by Rodolphe Kreutzer, Pierre Baillet, Pierre Rode, Charles-Auguste de Bériot, and others, following the example of Niccolò Paganini, whose 24 *Capricci* for solo violin set the pace for 19th-century virtuosity at large.

etymology, the history of a word or word element, including its origins and derivation. Although the etymologizing of proper names appears in the Old Testament and Plato dealt with etymology in his dialogue *Cratylus*, lack of knowledge of other languages and of the historical developments that languages undergo prevented ancient writers from arriving at the proper etymologies of words.

Modern scientific etymological study is based on the methods and findings of historical and comparative linguistics, the basic principles of which were established by linguists during the 19th century. The general principles involved in present-day etymology are:

1. The earliest form of a word, or word element, must be ascertained, as well as all parallel and related forms.
2. Every sound of a given word, or word element, must be compared with the corresponding sound in the form (often called its etymon) from which it is derived.
3. Any deviation in the previously established phonetic correspondences for the language of which the word is a part must be plausibly and rationally explained.
4. Any shift in meaning that has occurred in the historical transmission of the word must also be explained.

5. Words that present nonnative sounds, or combinations of sounds, that appear isolated in the language, or that demonstrate marked deviation from the usual phonetic correspondences, are probably borrowed rather than inherited, and the language of origin must be determined.

Etzel (Germanic epic character): see Atli, Lay of; Kriemhild; Nibelungenlied.

Etzel (Zionist terrorist organization): see Irgun Zvai Leumi.

EUB: see Evangelical United Brethren Church.

eubacterium, plural EUBACTERIA, any of a group of true bacteria, one of two major groups of prokaryotic organisms. The other group, the archaeobacteria, are as different from eubacteria as either is from the eukaryotes. The division of the bacteria into two groups has been suggested by ribosomal RNA studies of the genetic information of the organisms. Eubacteria and archaeobacteria are thought to have evolved separately from a common ancestor early in Earth's history. Eubacteria and archaeobacteria differ in important characteristics, such as the number of ribosomal proteins and the size and shape of the ribosomal S unit. See bacterium; archaeobacterium.

Euboea, Modern Greek ΕΒΥΟΙΑ, island, the largest in Greece, after Crete. In the Aegean Sea, it forms with the island of Skyros to the northwest, the *nomós* (department) of Euboea, whose capital is Chalcis (*q.v.*). Recognized geographically as part of the Greek mainland, which it almost touches at Chalcis, it lies along the coasts of the *nomíoi* of Attica, Boeotia, Phthiotis, and Magnesia. It is separated from the mainland by the North Gulf of Euboea and South Gulf of Euboea. It is about 110 miles (180 km) northwest-southeast, from 4 to 30 miles in breadth, and 1,412 square miles (3,657 square km) in area. The island is distinctly a prolongation of the Thessaly massif. Its principal ranges are separated by fertile lowlands.

The highest peaks in the north are Xirón Mountain (3,251 feet [991 m]) and Teléthron Mountain (3,182 feet [970 m]). From Teléthron the range trends eastward to the coast. In the centre of the island rises Dhírfis Mountain (5,715 feet [1,742 m]), while in the south Ókhi Mountain reaches 4,587 feet (1,398 m). The east coast is rocky and harbourless; in ancient times the main traffic from the north Aegean to Athens used the inshore channels because of the hazards of Cape Kafirévs on the southeast coast. Euboea has few streams, though south of Chalcis flows the Lílax River, the fertile plain of which in antiquity was a horse-breeding region that was bitterly contested by the rival cities of Chaleis and Eretria (Erétria).

The earliest inhabitants were the Abantes, who brought a Bronze Age culture from central Greece. In classical literature the island had a number of names, including Maeris, Doliche, Abantis, and Hellopia, the last derived from the Hellopes, who occupied the north. The centre was occupied by the Ionians and the south by the Dryopes. The Ionians excelled at navigating the sea and traded in swords; Ionian Chaleis led the colonizing movement to Italy and Sicily, while Eretria, just south of Chalcis, about 750–700 BC led a large-scale colonization of the Thracian peninsula, later known as Chalcidice. Eretrians were the first to colonize Corfu, but on the arrival of the Corinthians (*c.* 734 BC) they retired to the Albanian coast. The alphabet of Chalcis

and the local country tribal name of Graecus were eventually adopted by the Romans and western Europe.

Euboea's prosperity was checked by several decades of war, beginning about 700 BC, between Chaleis and Eretria. When the Euboeans lost their former trade advantages on the mainland, they were forced into an alliance with Boeotia and Sparta against Athens. In 506 Athenians captured Chaleis and settled the Lelantine Plain with their own citizens. In 490 the Persian king Darius I the Great subjugated Carystus (modern Káristos) in the south and destroyed Eretria. During the counteroffensive Euboea joined the Delian League and helped to win a great naval victory over the Persians (480). The island soon fell to Athenian imperialism, against which Euboea revolted in 446 and 411, the latter during the Peloponnesian War. A league of Euboean states formed during the second half of the 4th century BC had a long but interrupted existence. Under Roman domination Chaleis prospered. At the end of the 14th century AD, Venice won complete control of the island, but in 1470 they lost it to the Turks, who held it until it became a part of Greece in 1830.

The mountains of Euboea still have good pasture for sheep and cattle, and the name may be derived from *euboiá*, "rich in cattle." Both forests and pastures, however, were devastated badly under the Turks by poor land-use practices. In antiquity the mountains yielded iron and copper, the basis of Chaleis' lucrative metalworking and export trade; now magnesite and nickel are exported. Lignite is mined at Kími and near Alivérion to fuel power stations. Káristos exports the green and white *cipollino* marble, which was much used for building in imperial Rome. The valleys produce grapes, olives, vegetables, fruit, and cereals. There is some industry, and the population is varied: the south, much like Ándros Island to the southeast, is occupied by Albanians, and a Vlaeh element lives in the hill country. Pop. (1991) *nomós*, 209,132.

Euboea, Gulf of, Modern Greek ΕΒΥΟΙΚΟΣ ΚΌΛΠΟΣ, arm of the Aegean Sea, between the island of Euboea (northeast) and the Greek mainland (southwest). Trending northwest-southeast, the gulf is divided by the narrow Strait of Euripus, at the town of Chalcis (Khalkís). The northern part is about 50 miles (80 km) long and up to 15 miles (24 km) wide, and the southern part is about 30 miles (48 km) long, with a maximum width of 9 miles (14 km). The northern gulf's western shore is very irregular; several large inlets indent the base of the Kallidhromon mountain range. The eastern shore is more regular although also highly indented, as is the southern gulf's western margin.

Euboea was probably once connected to the geologically related mainland at its northern tip, and a land bridge certainly once existed across the Euripus, a submerged river valley the present water depth of which, at 20 to 27 feet (6 to 8 m), is navigable only by small vessels. The Euripus has been spanned since 411 BC, when the Chalcidians and Boeotians barred the channel with a dike and tower system. Chalcis has port facilities on both sides of the strait, as well as a shipyard on the mainland side at Avlis.

Eubulides of MILETUS (b. Miletus, fl. 4th century BC), a member of the Megarian school of philosophy in Athens and renowned as an inventor of logical paradoxes, the most famous of which is "The Liar" ("Does a man who says that he is now lying, speak truly?"). He was a contemporary of Aristotle, whom he attacked, and tradition says that he was a teacher of Demosthenes.

Eubulus (fl. 4th century BC), Athenian statesman noted for his able financial administration.

Eubulus first became prominent in 355 and from then until 346 he was the most influential politician in Athens. As chief commissioner of the Theoric Fund, which provided free seats at public spectacles, he exercised control over Athenian finances, since commissioners of the fund were granted power in other departments of finance. His astute supervision of state expenditure restored the economic position of Athens without increasing the burden of taxation. Under his guidance the efficiency of the fleet was improved and docks and fortifications repaired. Because this financial policy was based on the assumption that Athens should not be involved in major wars, Eubulus maintained a pacific attitude toward Philip II of Macedonia but was bitterly opposed by the anti-Macedonian politician Demosthenes. Eubulus was largely responsible for the overtures to Philip that led to the Peace of Philocrates in 346; with this treaty his political ascendancy ended.

Eucalyptus, large genus of mostly very large trees, of the myrtle family (Myrtaceae), native to Australia, New Zealand, Tasmania, and nearby islands. More than 500 species have been described. In Australia the eucalypti are commonly known as gum trees or stringybark trees. Many species are cultivated widely throughout the temperate regions of the world as shade trees or in forestry plantations. Economically, eucalyptus trees constitute the most valuable group within the order Myrtales.

The leaves are leathery and hang obliquely or vertically. The flower petals cohere to form a cap when the flower expands. The fruit is surrounded by a woody, cup-shaped receptacle and contains numerous minute seeds. Possibly the largest fruits—from 5 to 6 centimetres (2 to 2.5 inches) in diameter—are borne by *E. macrocarpa*, also known as the mottlecah, or silverleaf, eucalyptus.

The eucalypti grow rapidly, and many species attain great height. *E. regnans*, the giant gum tree or mountain ash of Victoria and Tasmania, attains a height of about 90 metres (300 feet) and a circumference of 7.5 m.

The leaf glands of many species, especially *E. salicifolia* and *E. globulus*, contain a volatile, aromatic oil known as eucalyptus oil. Its chief use is medical, and it constitutes an active ingredient in expectorants and inhalants. *E. globulus*, *E. siderophloia*, and other species yield what is known as Botany Bay kino, an astringent dark-reddish resin, obtained in a semifluid state from incisions made in the tree trunk.

Eucalyptus wood is extensively used in Australia as fuel, and the timber is commonly used in buildings and fencing. Among the many species of timber-yielding eucalypti are *E. salicifolia*, *E. botryoides*, *E. diversicolor* (commonly called karri), *E. globulus*, *E. leucoxylon* (commonly called ironbark), *E. marginata* (commonly called jarrah), *E. obliqua*, *E. resinifera*, *E. siderophloia*, and others. The bark of many species is used in paper-making and tanning.

eucaryote, any cell or organism that possesses a clearly defined nucleus, a description that excludes bacteria and blue-green algae. The eucaryotic cell has a nuclear membrane, well-defined chromosomes (bodies containing the hereditary material), mitochondria (cellular energy exchangers), a Golgi apparatus (secretory device), an endoplasmic reticulum (a canal-like communication system within the cell), and lysosomes (digestive apparatus within many cell types). *Compare* procaryote.

Eucharist, also called HOLY COMMUNION, or LORD'S SUPPER, a Christian sacrament commemorating the action of Jesus at his Last Supper with his disciples, when he gave them bread saying, "This is my body," and wine saying, "This is my blood." The story of the institution of the Eucharist by Jesus on the night before his Crucifixion is reported in four books of the New Testament (Matt. 26:26–28; Mark 14:22–24; Luke 22:17–20; and I Cor. 11:23–25). The letters of Paul and the Acts of the Apostles make it clear that early Christianity believed that this institution included a mandate to continue the celebration as an anticipation in this life of the joys of the banquet that was to come in the Kingdom of God.

The Eucharist has formed a central rite of Christian worship. However, although the Eucharist is intended as a symbol of the unity of the church and as a means of fostering that unity, it has been a source of disunity and contention as well. All Christians would agree that it is a memorial action in which, by eating bread and drinking wine (or, for some Protestants, grape juice), the church recalls what Jesus Christ was, said, and did; they would also agree that participation in the Eucharist enhances and deepens the communion of believers not only with Christ but also with one another. The breaking of the bread and the pouring of the wine are recognized by every Christian denomination as the central symbols of the death of Jesus Christ on the Cross. Most Christian traditions teach that Jesus is present in the Eucharist in some special way, though they disagree about the mode, the locus, and the time of that presence. In short, there is more of a consensus among Christians about the meaning of the Eucharist than would appear from the confessional debates over the sacramental presence, the effects of the Eucharist, and the proper auspices under which it may be celebrated.

According to the eucharistic doctrine of Roman Catholicism, the elements of bread and wine are "transubstantiated" into the body and blood of Christ; *i.e.*, their whole substance is converted into the whole substance of the body and blood, although the outward appearances of the elements, their "accidents," remain. Such practices as the adoration and reservation of the Host follow from this doctrine that the whole Christ is really present in his body and blood in the forms of bread and wine. During the 19th and 20th centuries the Roman Catholic Liturgical Movement put new emphasis on the frequency of communion, on the participation of the entire congregation in the priestly service, and on the Real Presence of Christ in the church as the fundamental presupposition for the Real Presence in the Eucharist.

The eucharistic beliefs and practices of Eastern Orthodoxy have much in common with those of Roman Catholicism, differing principally in the area of piety and liturgy rather than doctrine. The major difference includes the use of leavened rather than of unleavened bread. While Roman Catholic theology maintains that the recitation of the words of institution constitutes the Eucharist as a sacrament, Eastern theology has taught that the invocation of the Holy Spirit upon the elements (Greek *epiklēsis*) is part of the essential form of the Eucharist.

Among other Western Christians, those that adhere most closely to the traditions of Catholic eucharistic doctrine and practice are the Anglicans and the Lutherans. Early Anglican theology vigorously opposed Roman Catholic teaching on the sacraments, but, from the beginning of and, especially, since the 19th century, Anglican liturgical practice has retained much of the Catholic tradition. In the 16th century, Lutheranism unequivocally affirmed the Real Presence of the body

and blood of Christ "in, with, and under" the bread and wine and emphasized that the reason for the Eucharist is the remission of sins. In their liturgies both Anglicanism and Lutheranism worked within the framework of the mass, adopting certain elements and rejecting others; the liturgical movements in both traditions during the 19th and 20th centuries restored additional elements, even though the theological interpretation of the Lord's Supper continued to display great variety.

In Reformed Christianity, Huldrych Zwingli emphasized the memorial aspect of the Eucharist. John Calvin, however, taught a "real but spiritual presence" of the living Christ, but in the sacramental action rather than in the elements.

In other traditions within Protestantism the sacraments have become "ordinances," not channels of grace but expressions of faith and obedience of the Christian community. Among Baptists the practice of "close communion" has restricted the ordinance to those who are baptized properly; *i.e.*, as adults upon a profession of faith. The Society of Friends (Quakers) dropped the use of the Eucharist altogether in its reaction against formalism.

As a result of these variations in both doctrine and practice, the Eucharist has been a central issue in the discussions and deliberations of the ecumenical movement.

Euchre, card game that in the late 1800s was the most popular family card game in the United States, mainly as the partnership game for four.

The game is played with a 32-card deck, the cards ranking from ace down to 7, except that in the trump suit the jack, called the right bower, is the highest trump and the jack of the other suit of the same colour, called left bower, is the second highest trump. Five cards are dealt each player in a three-two or two-three sequence. The next card is turned face up as trump, which each player can accept or reject (starting with the player to the dealer's left). If any player accepts, the dealer can discard a card from his hand and take the turn-up. If all four reject trump, the turn-up card is placed at the bottom of the pack; then, starting to the left of the dealer, each player in turn can name another suit or pass. If all pass, the hands are thrown in.

If trumps are made, the player to the dealer's left leads, but the trump maker can announce "I play alone"; his partner then lays his cards face down and the lead comes from maker's left. The usual rules of trick making apply, the highest card of the suit led winning or the highest trump. The object is to win three or more tricks (the point), preferably all five (the march). If the maker's side fails to win, it is euchred. The maker's side scores 1 for the point, 2 for the march, or 4 for the march if won by the lone player.

Cutthroat Euchre is for three players: the maker plays alone against the other two. Two-hand Euchre is the same as the regular game but is played with a 24-card deck, omitting the 7s and 8s. Railroad Euchre allows various local rules, such as using the joker as a 10th and highest trump. Auction Euchre is played with five, six, or seven hands and a three-card widow (four if a joker is used); highest bidder through one round names trumps and selects one or more partners, after seeing the widow, based on the size of his bid.

Eucken, Rudolf Christoph (b. Jan. 5, 1846, Aurich, East Friesland—d. Sept. 14, 1926, Jena, Ger.), German Idealist philosopher, winner of the Nobel Prize for Literature (1908), interpreter of Aristotle, and author of works in ethics and religion.

Eucken studied at the University of Göttingen under the German thinker R.H. Lotze, a theological Idealist, and at Berlin under F.A. Trendelenburg, a German philosopher whose ethical concerns and historical treatment of

philosophy attracted him. Appointed professor of philosophy at the University of Basel, Switz., in 1871, Eucken left in 1874 to become professor of philosophy at the University of Jena, a position he held until 1920.

Eucken
By courtesy of the Universitätsbibliothek, Jena. E. Ger

Distrusting abstract intellectualism and systematics, Eucken centred his philosophy upon actual human experience. He maintained that man is the meeting place of nature and spirit and that it is his duty and his privilege to overcome his nonspiritual nature by incessant active striving after the spiritual life. This pursuit, sometimes termed ethical activism, involves all of man's faculties but especially requires efforts of the will and intuition. A strident critic of naturalist philosophy, Eucken held that man's soul differentiated him from the rest of the natural world and that the soul could not be explained only by reference to natural processes. His criticisms are particularly evident in *Individual and Society* (1923) and *Der Sozialismus und seine Lebensgestaltung* (1920; *Socialism: An Analysis*, 1921). The second work attacked Socialism-as-a system that limits human freedom and denigrates spiritual and cultural aspects of life. Eucken's Nobel Prize diploma referred to the "warmth and strength in presentation with which in his numerous works he has vindicated and developed an idealist philosophy of life." His other works include *Der Sinn und Wert des Lebens* (1908; *The Meaning and Value of Life*, 1909) and *Können wir noch Christen sein?* (1911; *Can We Still Be Christians?*, 1914).

Eucla Basin, artesian depression in Western Australia and South Australia, Australia. Sloping southward to the Great Australian Bight and underlying the enormous limestone waste of the Nullarbor Plain, its area is about 69,500 sq mi (180,000 sq km). Composed of two aquifers, the upper layer of the basin is a sequence of limestones of Tertiary age and the deeper layer is composed of sandstone of Cretaceous age. Surface water percolating down through the limestone of the basin has created subterranean caves and tunnels. Small amounts of groundwater can be tapped through bores. The name Eucla is derived from the Aboriginal words *yer*, meaning "bright"; and *coloya*, meaning "fire."

Euclid, Greek EUCLEIDES (fl. c. 300 BC, Alexandria), the most prominent mathematician of Greco-Roman antiquity, best known for his treatise on geometry, the *Elements*.

Life and work. Of Euclid's life it is known only that he taught at and founded a school at Alexandria in the time of Ptolemy I Soter, who reigned from 323 to 285/283 BC. Medieval translators and editors often confused him with the philosopher Euclides of Megara, a contemporary of Plato about a century before, and therefore called him Megarensis. Writing in the 5th century AD, the Greek

philosopher Proclus told the story of Euclid's reply to Ptolemy, who asked whether there was any shorter way in geometry than that of the *Elements*—"There is no royal road to geometry." Another anecdote relates that a student, probably in Alexandria, after learning the very first proposition in geometry, wanted to know what he would get by learning these things, whereupon Euclid called his slave and said, "Give him threepence since he must needs make gain by what he learns."

Sources of the Elements. Euclid compiled his *Elements* from a number of works of earlier men. Among these are Hippocrates of Chios (5th century BC), not to be confused with the physician Hippocrates of Cos (flourished 400 BC). The latest compiler before Euclid was Theudius, whose textbook was used in the Academy and was probably the one used by Aristotle. The older elements were at once superseded by Euclid's and then forgotten. For his subject matter Euclid doubtless drew upon all his predecessors, but it is clear that the whole design of his work was his own. He evidently altered the arrangement of the books, redistributed propositions among them and invented new proofs if the new order made the earlier proofs inapplicable. Thus, while Book X was mainly the work of the Pythagorean Theaetetus (flourished 369 BC), the proofs of several theorems in this book had to be changed in order to adapt them to the new definition of proportion developed by Eudoxus (q.v.). According to Proclus, Euclid incorporated into his work many discoveries of Eudoxus and Theaetetus. Most probably Books V and XII are the work of Eudoxus, X and XIII of Theaetetus. Book V expounds the very influential theory of proportion that is applicable to commensurable and incommensurable magnitudes alike (those whose ratios can be expressed as the quotient of two integers and those that cannot). The main theorems of Book XII state that circles are to one another as the squares of their diameters and that spheres are to each other as the cubes of their diameters. These theorems are certainly the work of Eudoxus, who proved them with his "method of exhaustion," by which he continuously subdivided a known magnitude until it approached the properties of an unknown. Book X deals with irrationals of different classes. Apart from some new proofs and additions, the contents of Book X are the work of Theaetetus; so is most of Book XIII, in which are described the five regular solids, earlier identified by the Pythagoreans. Euclid seems to have incorporated a finished treatise of Theaetetus on the regular solids into his *Elements*. Book VII, dealing with the foundations of arithmetic, is a self-consistent treatise, written most probably before 400 BC.

Other books of the *Elements* are not on this high mathematical level. In Book VIII, the second of the three arithmetical books, are found cumbersome enunciations, needless repetitions, and even logical fallacies. Apparently Euclid's exposition excelled only in those parts in which he had excellent sources at his disposal.

Renditions of the Elements. In ancient times, Hero and Pappus of Alexandria and Proclus and Simplicius all wrote commentaries. Theon of Alexandria (4th century AD) brought out a new revision of the work with textual changes and some additions; his version was the basis of all published Greek texts and translations until, early in the 19th century, an important Greek manuscript containing an ante-Theonine text was discovered in the Vatican. Three Arabic translations were made in the middle ages: by al-Hajjāj ibn Yūsuf ibn Maṭar, first for the Abbāssid caliph Hārūn ar-Rashīd (ruled 786–809) and again for the caliph al-Ma'mūn (ruled 813–833); by Hunayn ibn Ishāq (ruled 808–873), in Baghdad, whose translation was revised by Thābit

ibn Qurrah (died 901); and by Naṣīr ad-Dīn aṭ-Ṭūsī in the 13th century. Euclid was first made known in the West through Latin translations of these Arabic versions.

The first extant Latin translation of the *Elements* was made about 1120 by Adelard of Bath, who obtained a copy of an Arabic version in Spain, where he travelled while disguised as a Muslim student. Adelard also composed an abridged version and an edition with commentary. Hermann of Carinthia translated Books I–XII from the same Arabic version. Gerard of Cremona (c. 1114–87) translated the 15 books of Euclid from the Ishāq-Thābit version. The first Latin translation to be printed was by Johannes Campanus in the 13th century.

The first direct translation from the Greek without the Arabic intermediary was made by Bartolomeo Zamberti and published in Vienna in Latin in 1505; and the *editio princeps* of the Greek text was published at Basel in 1533 by Simon Grynaeus. But the most important Latin translation of this period was by Federico Commandino in 1572. The first edition of the complete works of Euclid was the Oxford edition of 1703, in Greek and Latin, by David Gregory. All texts are now superseded by *Euclid's Opera Omnia* (8 vol. and a supplement, 1883–1916), edited by J.L. Heiberg and H. Menge. The first English translation of the *Elements* was by Sir Henry Billingsley. The many later editions include Robert Simson's in Latin and English, containing Books I–VI, XI, XII, and the *Data*, in 1756; and the definitive *The Thirteen Books of Euclid's Elements* by T.L. Heath, with introduction and commentary (3 vol., 1908; 2nd ed., 1926).

Other writings. Other extant works of Euclid include two belonging to elementary geometry: the *Data*, containing 94 propositions, which demonstrates that, if certain elements in a figure are given, then other things are given—i.e., can be determined; and a book *On Divisions* (of figures), discovered in both Arabic and Latin versions and restored and edited in 1915, which deals with problems of dividing a given figure by one or more straight lines into parts that are equal or that have given ratios to one another or to other given areas. The *Optics* of Euclid is extant in Greek in two forms, one being Euclid's own treatise, and the other a critical revision by the Greek writer Theon. The *Catoptrica* ("Reflections") is not by Euclid but is, rather, a later compilation from ancient works on the subject. The *Phaenomena*, extant in Greek, is a treatise on the geometry of the sphere for use in astronomy and is similar in content to the work, by Autolycus of Pitane, *Moving Sphere*. The *Elements of Music* is attributed to Euclid by Proclus and Marinus, the latter being another Greek commentator. Included in this work are two treatises that probably are not by Euclid: the *Sectio canonis* ("Division of the Scale"), which gives the Pythagorean theory of music with some later additions; and the *Introductio harmonica* ("Introduction to Harmony"), written by Cleonides, a student of Aristoxenus, in which an identifiable tone separates notes on the scale.

Four lost works in geometry are described in Greek sources and attributed to Euclid. The purpose of the *Pseudaria* ("Fallacies"), it is said, was to distinguish and to warn beginning students against different types of fallacies to which they might be susceptible in geometrical reasoning. The *Porisms*, in three books, was an advanced work of which Pappus gave a summary account. Although the word means "corollaries," Euclid apparently meant a statement that was intermediate in significance between a problem and a theorem. The *Conics*, made up of four books on conic sections, cor-

responded in content to the first four books of Apollonius' *Conics*, although Apollonius added new theorems to his own treatment. Euclid called the conics by their previous designations, sections of a right-angled cone, an obtuse-angled cone, and an acute-angled cone, respectively; it was Apollonius who first gave them the names parabola, hyperbola, and ellipse, the descriptions of which he derived. Pappus also mentioned the *Surface-loci*, which is made up of two books that probably dealt with loci on surfaces, perhaps also loci which are surfaces, and with conic sections.

A fragment in Latin, *De levi et ponderoso*, which is included in Gregory's edition of Euclid, contains a statement of the principles of Aristotle's dynamics but is not by Euclid.

Assessment. Almost from the time of its writing and lasting almost to the present, the *Elements* has exerted a continuous and major influence on human affairs. It was the primary source of geometric reasoning, theorems, and methods at least until the advent of non-Euclidean geometry in the 19th century. It is sometimes said that, next to the Bible, the *Elements* may be the most translated, published, and studied of all the books produced in the Western world. Euclid may not have been a first-class mathematician. He certainly was, however, a first-class teacher of mathematics, inasmuch as his textbook has remained in use practically unchanged for more than 2,000 years. (B.L.v.d.W.)

MAJOR WORKS. Euclid's extant works are collected in *Euclid's Opera Omnia*, ed. by J.L. Heiberg and H. Menge, 8 vol. and a supplement (1916), containing the *Elements*, Books I–XIII (*The Thirteen Books of Euclid's Elements*, trans. by Sir Thomas Heath, 1952), *Data (Euclid's Data, restored to their true and genuine order*, trans. by R. Jack, 1756), *Euclid's Book on Divisions of Figures*, ed. by R.C. Archibald (1915), *The Optics*, and *The Phenomena*.

BIBLIOGRAPHY. George Sarton, *Introduction to the History of Science*, vol. 1, pp. 153–156 (1927, reprinted 1968), an extensive bibliography; B.L. van der Waerden, *Ontwakende wetenschap (1950; Science Awakening, 1954)*, a readable orientation to Euclid and his place in history; Thomas L. Heath, *A History of Greek Mathematics*, vol. 1, pp. 354–446 (1921, reprinted 1965), an authoritative survey of Euclid's works; Albert Lejeune, *Euclide et Ptolémée, deux stades de l'optique géométrique grecque* (1948); Marshall Clagett, "The Medieval Latin Translations from the Arabic of the Elements of Euclid, with Special Emphasis on the Versions of Abelard of Bath," *Isis*, 44:16–42 (1953); and Glenn R. Morrow (ed. and trans.), *Proclus' Commentary on the First Book of Euclid's Elements* (1970), three scholarly studies.

Euclid, city, Cuyahoga county, northeastern Ohio, U.S., on Lake Erie, just northeast of Cleveland. The original township area was settled in 1798 and was named for the famous Greek mathematician by the surveyors who arrived with Moses Cleaveland, an agent of the Connecticut Land Company. It remained largely rural, noted chiefly for grapes, until after 1940, when there was rapid industrial and urban growth. Manufactures now include airplane parts, castings, brass and copper goods, electrical and welding equipment, and road machinery. Inc. town, 1880; village, 1903; city, 1930. Pop. (1990) 54,875.

Euclidean and non-Euclidean geometry, the study of points, lines, angles, surfaces, and solids, on the basis of either the 10 axioms and postulates selected by the Greek mathematician Euclid (c. 300 bc) or a modification of Euclid's system (commonly the replacement of the so-called parallel postulate). The importance of Euclidean geometry lies not so much in the actual mathematics that it contains as in the systematic method used by Euclid to present and develop that mathematics.

This method, called the axiomatic-deductive method, has served as the model for the development of many other mathematical subject areas for more than 2,000 years.

A brief treatment of Euclidean and non-Euclidean geometry follows. For full treatment, see *MACROPAEDIA: Geometry: Euclidean geometry; Non-Euclidean geometry*.

Euclid's *Elements*, a set of 13 books, dealt with various aspects of plane and solid geometrical figures, their measurement, and their relationships to one another. It appears that very little of the mathematics contained in the *Elements* was due to Euclid himself, although some of the results and proofs undoubtedly were.

From the 10 axioms and postulates, Euclid deduced 465 theorems, or propositions. This was the first demonstration of the power of the axiomatic method, in which the truth of the derived theorems follows from the truth of the axioms and postulates. Because the latter were offered as self-evidently true, Euclid's contemporaries felt that the derived theorems constituted accurate descriptions of the world and valid tools for studying it.

Euclid's parallel postulate attracted interest almost as soon as the *Elements* appeared, because it seemed less self-evident than the others. Its most popular equivalent is: Through a given point P not on a line l , there is only one line in the plane of P and l that does not meet l . Attempts to derive the parallel postulate from the others, thereby transforming it into a theorem, involved replacing it with its two alternatives—that there is no such line or that there are more than one—and then showing that contradictions ensue. Unexpectedly, no contradictions resulted from either substitution: the outcome was, instead, two new, non-Euclidean geometries that were found to be just as valid and consistent as Euclidean geometry.

It soon became clear that it is impossible to tell which, if any, of the three geometries is the most accurate as a mathematical representation of the real world. Thus, mathematicians were forced to abandon the cherished concept of a single correct geometry and to replace it with the concept of equally consistent and valid alternative geometries. They were also forced to realize that mathematical systems are not merely natural phenomena waiting to be discovered; instead, mathematicians create such systems by selecting consistent axioms and postulates and studying the theorems that can be derived from them. It is this change of viewpoint that may prove to be the most important and far-reaching part of Euclid's intellectual legacy.

Eucommiales, order of dicotyledonous flowering plants comprising the single species *Eucommia ulmoides* (family Eucommiaceae). It is an elmlike tree of central and eastern China notable as a woody plant of temperate regions with milky latex from which rubber can be produced.

Eucommia is cultivated as an ornamental in mild climates. The bark has medicinal properties and is valued especially by the Chinese. The species is also of interest for its isolated evolutionary position, as reflected in the status it holds as a single-species order. No other plant orders quite encompass the characteristics of this plant, although it has been referred to the witch hazel and nettle orders (Hamamelidales and Urticales) by different authorities.

In addition to latex and deciduous leaves, the order is characterized by the presence of simple, toothed leaves produced alternately along the stems. The flowers are solitary and unisexual and lack petals and sepals. The male flowers have 6 to 10 stamens (pollen-producing structures), and the female flowers have one ovary composed of two carpels, one of which aborts during development. The fruit

Eucommia ulmoides

Kitty Kohout from Root Resources—EB Inc

thus contains only one seed and is a dry, winged structure.

Eucratides (d. c. 159 bc), king of Bactria, who reigned from c. 170/165 to c. 159 bc. Little is known of his reign. According to some scholars, he was a cousin of the Seleucid king Antiochus IV and assumed power in Bactria as the result of an invasion. Others have assumed that he was a Bactrian official who raised a rebellion while King Demetrius was in India.

Upon Demetrius' return from India, he besieged Eucratides and 300 followers for several months, until Eucratides broke the siege and seized the kingdom. Once in control of Bactria, Eucratides went to India to claim possession of Demetrius' territory there. During his absence the Parthians apparently annexed two Bactrian provinces. Returning from India to reconquer them, Eucratides is said to have been murdered by his son.

eucrite, rock that contains 30 to 35 percent calcium-rich plagioclase feldspar (bytownite or anorthite), as well as augite, hypersthene, pigeonite, and olivine. The name was given (1863) by Gustav Rose to stony meteorites of this composition (see achondrite), but it has been extended to include similar intrusive igneous rocks (solidified from a liquid state). Occurrences of terrestrial origin are in Scotland, where it is common in the Tertiary ring complexes, and Carlingford, County Louth, Ire.

Eucryphia, genus of evergreen shrubs and trees, constituting the family Eucryphiaceae, with about five species native to Australia and Chile. They are planted in warm regions for their foliage and showy camellia-like cream-white flowers, which appear in late summer and fall.

E. cordifolia, which grows to a height of 12 m (40 feet), and *E. glutinosa*, up to 4.5 m (14.8 feet), have produced the hybrid *E. Xnymansensis*, hardier than *E. cordifolia* and tolerant of alkaline soils.

Eucumbene, Lake, one of Australia's largest reservoirs (capacity 3,890,000 acre-feet [4,798,000,000 cubic m], surface area 56 square miles [145 square km]), the major storage facility of the Snowy Mountains Hydroelectric Scheme, in the Eastern Highlands, New South Wales, 55 miles (88 km) southwest of Canberra. Its dam (completed 1958), fed by the Eucumbene, Upper Murrumbidgee,

and Snowy rivers, is 381 feet (116 m) high. The river waters are conveyed to and from the lake by means of pressure tunnels and are regulated to serve the Tumut and Murray electric power stations. The lake has also been developed as a tourist and fishing centre.

eudaemonism, also spelled **EUDAEMONISM**, or **EUDEMONISM**, in ethics, a self-realization theory that makes happiness or personal well-being the chief good for man. The Greek word *eudaimonia* means literally "the state of having a good indwelling spirit, a good genius"; and "happiness" is not at all an adequate translation of this word. Happiness, indeed, is usually thought of as a state of mind that results from, or accompanies some actions. But Aristotle's answers to the question "What is *eudaimonia*?" (namely, that which is "activity in accordance with virtue"; or that which is "contemplation") show that for him *eudaimonia* was not a state of mind consequent on or accompanying certain activities but is a name for these activities themselves. "What is *eudaimonia*?" is then the same question as "What are the best activities of which man is capable?"

Later moralists, however—for instance, the 18th- and 19th-century British utilitarians Jeremy Bentham and John Stuart Mill—defined happiness as pleasure and the absence of pain. Others, still regarding happiness as a state of mind, have tried to distinguish it from pleasure on the grounds that it is mental, not bodily; enduring, not transitory; and rational, not emotional. But these distinctions are open to question. A temporal dimension was added to eudaemonism in ancient times by Solon, who said, "Call no man happy till he is dead," suggesting that happiness and its opposite pertain, in their broadest sense, to the full course of one's life. Contemporary moralists have tended to avoid the term.

Eudemus of Rhodes, also spelled **EUDEMOS**, or **EUDEMIS** (fl. before 300 BC), Greek philosopher who was a pupil of Aristotle and a friend of Theophrastus.

Together with Theophrastus, Eudemus completed Aristotle's philosophy from the point of view of systematization. The fragments of his *Physics* (preserved by Simplicius) and his *Analytics* paraphrase those of Aristotle—and it was Eudemus who edited or revised the *Eudemian Ethics*, which are preserved under Aristotle's name. His history of geometry, arithmetic, and astronomy completed the *Doctrines of the Natural Scientists* of Theophrastus. The fragments have been edited by F. Wehrli, *Eudemus von Rhodos* (1955), being part viii of *Die Schule des Aristoteles: Texte und Kommentar*.

Eudes (French personal name): see under Odo, except as below.

Eudes, German **ODO** (d. Jan. 1, 898), count of Paris and the first king of the West Franks (France) who was not of Merovingian or Carolingian blood.

The son of Robert the Strong, from whom all the Capetian kings of France descended, Eudes successfully defended Paris against the besieging Vikings (or Normans) in 885–886 and gained election as king as a result. Internal opposition meant that his position was never secure, however, and between 893 and 897 he had to fight off the challenge of the future Charles III the Simple, who was supported by Archbishop Fulk of Reims and Count Baldwin II of Flanders. Although Eudes won a victory over the Vikings at Montfaucon in 888, their depredations if anything became worse during his reign.

Eudes de Châtillon-sur-Marne, also called **EUDES DE LAGERY**, or **DE LAGNY** (pope): see Urban II.

Eudes, Saint John, French **SAINT JEAN EUDES** (b. Nov. 14, 1601, Ri, near Argentan, Fr.—d. Aug. 19, 1680, Caen; canonized 1925;

feast day August 19), founder of the Congregation of Jesus and Mary (Eudist Fathers), an order dedicated to the training of candidates for the priesthood and to the preaching of missions.

Educated by the Jesuits at Caen, John Eudes entered the Bérullian Oratory and in 1625 was ordained priest. A noted orator, he devoted 50 years to the preaching of parish missions. For the education and rehabilitation of delinquent girls and women, he established the Order of Our Lady of Charity (1641). Two years later he founded the Eudist Fathers. His most revered achievement was promoting the devotions to the Sacred Hearts of Jesus and Mary; he established the first feasts in their honour, for which he wrote the mass and office.

Eudocia, original name **ATHENAIS** (d. Oct. 20, 460, Jerusalem), wife of the Eastern Roman emperor Theodosius II. She was a highly cultured woman who exercised great influence over her husband until her withdrawal from Constantinople.

Athenais, as she was then called, came from Athens, where her father, Leontius, was a pagan philosopher. Before she and Theodosius were married (in June 421), Athenais was baptized a Christian and changed her name to Eudocia. A year later she gave birth to a daughter, Licinia Eudoxia, who married (437) the Western emperor Valentinian III (reigned 425–455). In 438 Eudocia went on a year's pilgrimage to Jerusalem. After a quarrel with Theodosius' influential sister Pulcheria, she returned to Jerusalem in 443 and remained there for the rest of her life, directing the rebuilding of that city's fortifications and the construction of several splendid churches.

Eudocia was sympathetic to Monophysitism—a heresy that maintained that Christ's human nature is absorbed in his divine nature—but she died an orthodox Christian. In addition to religious poetry she wrote a panegyric on the Roman victory over the Persians (422).

Eudocia Macrembolitissa (b. 1021, Constantinople, Byzantine Empire [now Istanbul, Tur.]—d. 1096, Constantinople), Byzantine empress and, in 1067 and 1071, regent, who has been called the wisest woman of her time.

The daughter of John Macrembolites and niece of Michael Cerularius, the patriarch of Constantinople, Eudocia was the wife of the emperor Constantine X Ducas. After his death in May 1067, she became regent for her three sons—Michael, Andronicus, and Constantine—ruling wisely and moderately and personally taking charge of the education of the heir apparent, Michael (the future Michael VII Ducas).

The threat of the Seljuq Turks, however, necessitated a strong military government, and Eudocia was persuaded to marry Romanus Diogenes, a Cappadocian general, who became the emperor Romanus IV Diogenes in 1068. After his disastrous defeat and capture by the Turks at Manzikert, Armenia, in August 1071, Eudocia and Michael ruled jointly. When Romanus, who had been ransomed from the Turks, attempted to reassert his claim to the throne, he was deposed. Eudocia was soon succeeded by Michael and subsequently entered a convent.

Eudoxia (d. Oct. 6, 404), wife of, and a powerful influence over, the Eastern Roman emperor Arcadius (reigned 383–408).

Her father was a Frankish chieftain and one-term Roman consul (385) named Bauto. The marriage (April 27, 395) of Arcadius to Eudoxia was arranged by Arcadius' corrupt minister, the eunuch Eutropius, who had supported the match in order to undercut the position of a political rival. But Eudoxia came to resent being dominated by Eutropius, and in 399 she helped bring about his downfall. The period of Eudoxia's most decisive influ-

ence over her ineffectual husband dates from her designation as augusta on Jan. 9, 400.

Although an earnest Christian, she quarreled bitterly with John Chrysostom, patriarch of Constantinople, who attacked her and the frivolity of her court in outspoken terms. In 404 she expelled him from his see and sent him into exile. Shortly afterward Eudoxia died from a miscarriage. But she had borne Arcadius four daughters and a son, who became the emperor Theodosius II (reigned 408–450). One of the daughters, Pulcheria, was regent for Theodosius II for several years.

Eudoxia, Russian in full **YEVDOKIYA FYODOROVNA LOPUKHINA** (b. Aug. 9 [July 30, Old Style], 1669, Moscow, Russia—d. Sept. 7 [Aug. 27], 1731, Moscow), tsarina and first wife of Peter I the Great of Russia.

In 1689 she was given in marriage to Peter, a bridegroom of only 17. Endowed with beauty but lacking intelligence and ambition, she had little in common with the young tsar, whose chief interest was the mechanics of war.

In 1698 Peter sent her to a monastery. There she took vows (1699) but left after six months and resumed life as a laywoman. Following the trial of her son, Tsarevich Alexis, for treason (1718), she was kept in confinement at a fortress east of St. Petersburg on Lake Ladoga. Upon the accession (1727) of her grandson Peter II, she was released and later installed at the Voznesensky Convent in Moscow and provided with a generous allowance. After the death of Peter II (1730), she made a feeble, unsuccessful attempt to succeed him.

Eudoxus of Cnidus (b. c. 400, Cnidus, Asia Minor [now in Turkey]—d. c. 350 BC, Cnidus), ancient Greek mathematician and astronomer who substantially advanced number theory and gave the first systematic explanation of the motions of the Sun, Moon, and planets. He introduced geometry into the science of astronomy and began the necessary interaction between observation and theory that has characterized its development ever since. His contributions are known through ample Greek sources, including commentaries in Byzantine codices, even though none of his writings has survived.

Life. Eudoxus, son of Aeschines, learned mathematics and medicine at a school that rivaled for a time that of Hippocrates of Cos. Impressed by his ability, a well-to-do physician paid his way to Athens so that he could study at Plato's Academy, which had been established in 387. He also spent 16 months in Egypt during the reign of Nectanebo I (380–363). At Heliopolis, now a Cairo suburb, Eudoxus learned the priestly wisdom, which included astronomy; there he wrote the *Oktaëtêris*, his first major work, concerning a calendar based on an eight-year cycle, perhaps from a study of Venus. Earning his living as a teacher, he then traveled in the region of the Sea of Marmara before returning to Athens, where he became respected throughout Greece as a legislator. The few facts concerning his life are derived largely from the writings of Diogenes Laërtius in the 3rd century AD.

Theory of proportion. It is generally agreed that Euclid drew heavily on Eudoxus in writing the *Elements*, particularly Books V and XII and sections of Books VI, X, and XIII. Eudoxus' two major contributions to mathematics are the theory of proportion, found in Book V, and the method of exhaustion, in Book XII. The philosopher Proclus attributed the first to him, and Archimedes credited him with the second. It is also possible that Euclid's axiomatic method was first developed by Eudoxus.

Around the 5th and 4th centuries BC, the Pythagoreans had observed relationships between certain geometrically measurable quan-

tities, such as that between the hypotenuse and legs of a right triangle (*i.e.*, the square of the hypotenuse is equal to the sum of the squares of the other two sides). But following this development, they also discovered that the lengths of certain geometric figures (*e.g.*, the diagonal of a square with sides equal to one) could be expressed only as an irrational number (*i.e.*, a nonterminating decimal, such as 1.414213... or $\sqrt{2}$). The discovery of irrational numbers about 400 BC meant that Pythagorean geometry, which dealt initially with commensurable quantities only, was inadequate; it had no means for dealing with irrational numbers.

Eudoxus' theory of proportion is treated extensively in Euclid's *Elements*, Book V, in which the definition of equal ratios (No. 5) is the principal source of the modern view of irrational numbers. With this theory, which was a major contribution to number theory, mathematics for the first time could take into account incommensurable quantities (*e.g.*, those whose ratio is not the quotient of two integers, such as the diameter and circumference of a circle), as well as such well-known commensurables as two sides of certain triangles. Thus, following the early Greek solution to the problem of finding areas and volumes bounded by straight lines that were represented by rational numbers, the theory of proportion allowed Eudoxus to deal, by means of rational approximations, with measurements that involved irrational numbers. He demonstrated that irrational numbers could be defined by means of approximations of rational numbers.

Method of exhaustion. More difficult, however, was the problem of calculating areas and volumes bounded by curves. Eudoxus' solution was the method of exhaustion—a modern term, not used by the ancient Greeks. By successfully including in this method not only the irrational but also the concept of the infinitesimally small quantity, he showed how to subdivide continuously a known magnitude (*e.g.*, the length of a straight line) until it closely approached that of an unknown, such as the properties of a curve. According to Archimedes, Eudoxus used this method to prove that the volumes of pyramids and cones are one-third the volumes of prisms and cylinders, respectively, with the same bases and heights—although Democritus probably had already discovered that this was so. Eudoxus also demonstrated that the areas of circles are proportional to the squares of their diameters. His technique was something like, but far more rigorous than, inscribing polygons with increasing numbers of sides within a circle in order to find its area. Because it could be used to compute areas and volumes bounded by curves, the method of exhaustion, which is fully elaborated in Book XII of Euclid's *Elements*, was a forerunner of integral calculus.

Although the geometric method of calculating the distance of the Sun and Moon from the Earth is usually attributed to Aristarchus of Samos (3rd century BC), there is a possibility that it may have been invented by Eudoxus. He also proposed a solution for another problem in astronomy—how to explain mathematically the observed motions of the Sun, Moon, and five planets. In order from the stationary Earth, these seven heavenly bodies were the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn. Although Eudoxus' own account of his solution by means of concentric spheres (an idea that may have originated with Parmenides of Elea around 500 BC) has not survived, the 19th-century Italian astronomer Giovanni Schiaparelli described its details from an analysis of brief references in Aristotle's *Metaphysics* and from a substantial discussion in the commentary on Aristotle's *De caelo* (Book II), written in

the 6th century AD by the Greek philosopher Simplicius.

Astronomy. Because the stars did not appear to have independent motion, the ancients perceived them to revolve around the Earth as a unit, forming a fixed backdrop against which the complicated and irregular motions of the planets were observed and plotted. To explain the motions Eudoxus constructed a model of 27 spheres. On the outer sphere he placed all the fixed stars, to account for their diurnal (daily) east-to-west motion. He devised a set of interconnected spheres for each of the other heavenly bodies—three each for the Sun and Moon and four each for the five planets. Each planet rode on the equator of its inner sphere except for the Moon, which rode on the middle; each sphere had its own appropriate axial inclination and rotational velocity. The outermost sphere accounted for the diurnal east-to-west motion.

The Moon's inner sphere was set at an angle to the ecliptic (the apparent path of the Sun through the constellations) and rotated east to west once each lunar (nodal) month (now known to be 27.2122 days). The middle sphere that carried the Moon moved west to east along the ecliptic to account for the Moon's phases. The Sun's inner sphere, moving west to east, was inclined (erroneously) to the ecliptic to account for the inequality of the seasons, and its middle sphere moved west to east along the ecliptic once each sidereal year (a round trip to the same place in the constellations).

To represent the retrograde motions of the five planets, Eudoxus depended on the combined rotatory motions of the two inner spheres of each. The resulting motion described an elongated figure-eight, which he called a hippopede. One of the few noncircular curves in antiquity, it represented the planet's "wandering" motion in latitude and longitude. As the planet, attached to the innermost sphere, oscillated along Eudoxus' hippopede during retrogressions, the hippopede itself revolved daily on the outermost sphere, while proceeding bodily once each sidereal year around the ecliptic by means of the next inner sphere (from the outside).

By devising combinations of spheres, Eudoxus accounted for the apparently irregular motions of the celestial bodies in the solar system, thus maintaining the Greek vision of circular perfection, the ancient symbol of wholeness. His system was an admirable attempt to "save the phenomena," the vivid Greek expression, in that it closely represented the observed motions of Mercury, Jupiter, Saturn, the Sun, and the Moon. But it was unsatisfactory for Venus and failed completely for Mars; nor could it account for variations in brightness, orbital period, apparent size of the Moon, or synodic period.

After his death in about 350 BC, Eudoxus' fundamental contributions to geometry and number theory led to further, lasting developments in Greek mathematics, as exemplified by the work of Archimedes. Eudoxus introduced into astronomy the view that uniform circular motion would account for the irregular motions of all the celestial bodies—the view that, with the epicyclic refinements of Ptolemy, prevailed until the time of the 17th-century astronomer Johannes Kepler. And his perception of circular regularity persists in modern mathematics in the periodic character of the infinite series. (R.P.A.)

BIBLIOGRAPHY. The classic analysis of Eudoxus' system of concentric spheres is by Giovanni Schiaparelli, "Le sfere omocentriche di Eudosso, di Callippo e di Aristotele," in *Pubblicazioni del R. Osservatorio di Brera in Milano*, no. 9 (1873), in which he also corrected certain errors made by Simplicius. This is the basis of the study of Eudoxus by Thomas L. Heath in his *Aristarchus of Samos* (1913); and by J.L.E. Dreyer, *A History*

of Astronomy from Thales to Kepler, 2nd ed. rev. (1953), which has the clearest exposition. Two studies by George de Santillana, "Eudoxus and Plato: A Study in Chronology," *Isis*, 32:248–262 (1940), and "On Forgotten Sources in the History of Science," in A.C. Crombie (ed.), *Scientific Change*, pp. 813–828 (1963), are discussions of the intellectual interaction of Eudoxus with his contemporaries and possible sources of his ideas. The most detailed studies of Eudoxus' mathematics are in two works of Thomas L. Heath: *The Thirteen Books of Euclid's Elements*, 2nd ed. rev., 3 vol. (1956), and *A History of Greek Mathematics*, 2 vol. (1921).

EUDOXUS OF CYZICUS (b. Cyzicus, Phrygia; fl. 2nd century BC), Greek navigator and explorer who made the first known attempt to circumnavigate Africa from western Europe. Following two successful voyages to India from the Red Sea for the king of Egypt, Ptolemy Evergetes II, he went to Gades, present-day Cádiz, Spain, where he outfitted three ships for his planned circumnavigation. On the first attempt he was driven around south of Morocco. He sailed again down the west coast of Africa but the entire expedition was lost. No further attempt was made to round southern Africa until the late 15th century.

EUMEROS (Greek mythographer): *see* Euhemerus.

Eufaula, city, Barbour county, southeastern Alabama, U.S., on the Chattahoochee River (there dammed to form the Walter F. George Reservoir [or Lake Eufaula], 48,600 ac [19,700 ha], at the Georgia state line. Founded (c. 1820) on an Eufaula Indian village site, it became a shipping point for cotton. The arrival (late 1850s) of the Central and Georgia Railroad led to industrial development. Agriculture, light manufacturing, paper milling, and bauxite mining form its economic base. A bridge over the reservoir connects with Georgetown, Ga. Lakepoint Resort State Park is at the reservoir's northern end. Inc. 1857. Pop. (1990) 13,220.

Eufaula, city, seat (1907) of McIntosh county, east central Oklahoma, U.S., near the confluence of the Canadian and North Canadian rivers, southwest of Muskogee. It originated as an Indian settlement and trading post and was named for a Creek town on the Chattahoochee River in Alabama called Yufala, meaning "they split here and went to other places." It developed as a ranching centre after the arrival of the Missouri-Kansas-Texas Railroad in 1872. The Eufaula Boarding School for Indian Girls, successor to the Asbury Mission School (established in 1849 by the Methodist Episcopal Church under contract to the Creek Indian Council), remains active as a government institution. The state's oldest newspaper, the *Indian Journal* (founded [1876] as a tribal organ in Muskogee) is published in Eufaula. The completion of the Eufaula Dam (1964) on the Canadian River, impounding one of the world's largest man-made lakes, covering 102,500 ac (41,500 ha), and the creation of Fountainhead State Park (north) and Arrowhead State Park (south) have made the city the focus of a recreation area. Pop. (1990) 2,652.

Eugene, city, seat (1853) of Lane county, western Oregon, U.S., on the Willamette River, adjoining Springfield to the east. Settled by Eugene Skinner in 1846, it was laid out in 1852, named Eugene City in 1853, and incorporated in 1862. The arrival of the Oregon and California (now Southern Pacific) Railroad in 1870 stimulated growth as an agricultural and lumber centre. The University of Oregon was founded there in 1872, followed by Northwest Christian College in 1895 and Lane Community College (1965). An art museum on the University of Oregon campus specializes in Oriental and Pacific Northwest collections.

A lumber-plywood economy, which also relies on the city's educational institutions, prevails and is augmented by food processing and light manufacturing. Eugene is a tourist centre for the MacKenzie River recreational area and Willamette National Forest, headquartered in the city. Pop. (1990) city, 112,669; Eugene-Springfield MSA, 282,912.

Eugene of Savoy, French in full FRANÇOIS-EUGÈNE, PRINCE DE SAVOIE-CARIGNAN, German FRANZ EUGEN, PRINZ VON SAVOYEN-CARIGNAN (b. Oct. 18, 1663, Paris—d. April 24, 1736, Vienna), field marshal and statesman of the Carignan line of the House of Savoy, who, in the service of the Austrian Holy Roman emperor, made his name as one of the greatest soldiers of his generation. He fought notably against the Turks in central Europe and the Balkans (1683–88, 1697, 1715–18) and against France in the War of the Grand Alliance (1689–97) and in the War of the Spanish Succession (1701–14). He was the teacher of Frederick the Great and the only one among the seven great strategists of all time whose campaigns Napoleon considered worthy of study by posterity.

Life. Eugene was the youngest son of the Comte de Soissons, of the House of Savoy-Carignan, and of Olympia Mancini, a niece of Cardinal Mazarin. His paternal ancestors were the dukes of Savoy, who later became kings of Sardinia, Sicily, and eventually of all Italy, while on his mother's side the family included not only Roman patricians but also hatters, valets, and humble artisans. A rumour once had it that Eugene was actually the son of Louis XIV, the Sun King, who, although he always denied it, was said to have had an affair as a young man with Olympia Mancini. Louis, in any event, was ashamed of this unprepossessing supposed offspring of his. So severely did he restrain Eugene's ambitions that the latter, after spending some 20 inglorious years in Paris and Versailles, left France altogether and offered his sword to the emperor Leopold I, who was busy fighting the Turks.

In his first battle, at the relief of Vienna from siege by the Turks in 1683, Eugene so distinguished himself that the Emperor gave him a regiment of dragoons to command the following year. Nothing could now retard this young genius on his way to world fame. It was more than just an outstanding strategic ability that made him victorious; it was also a contagious élan, which enabled him time and again to lead his men to triumph on the field of battle. With equal impetuosity he climbed the senior military ranks, becoming an imperial field marshal at the age of 29. He fought seven battles of major historical significance. Through the victories of Zenta, Peterwardein, and Belgrade, he once and for all secured Hungary for the Turks; together with the Duke of Marlborough, his great friend, he won Bavaria and all of Germany at Blenheim; at Turin he gained northern Italy; at Oudenarde and Malplaquet, the Netherlands. He lost only Spain, and that because of the political ineptitude of the emperor Charles VI.

Eugene's battles were among the bloodiest encounters of that sanguinary period, his marches among the most exhausting, and his decisions in difficult situations among the most daring and successful known in the history of war. And yet there was something still greater and rarer than his generalship in 24 battles: his wisdom in regarding military victory as a mere instrument for achieving political ends. Eugene not only made conquests but also secured them, and in his creative hands the works of peace quickly blossomed forth.

During a span of 39 years he continued to lead the Emperor's armies from the River Save all the way to Lombardy, through the Tirol back again to Bavaria and the Rhine, down once more to Hungary against the Turks, and

back up again to Flanders. He was wounded 13 times. Even as he faced a world of foes before him, he had a world of enemies at his back, nourished by the "hereditary curse" of Austria: slothful souls and thoughtless minds, low intrigue, envy, jealousy, foolishness, and dishonesty. He served three emperors: Leopold I, Joseph I, and Charles VI. Toward the end of his life, Eugene observed that, whereas the first had been a father to him and the second a brother, the third (who was perhaps least worthy of so great a servant) had been a master.

Belgrade (1718) was Eugene's most famous victory. In order to take the city, he had deployed his forces in a position that was both daring and dangerous. It was to no avail that others implored him again and again to withdraw the troops in order not to give the Turkish army—which was intent on raising the siege and which surrounded Eugene's forces with a superiority of four to one—the chance to undo them all. Furthermore, Eugene's soldiers were being decimated by disease. But he remained in position and, in a terrible battle that began in a thick fog in the dead of night, annihilated the relief army once the fog lifted at daylight. Capturing innumerable prisoners and the entire Turkish encampment, Eugene took the city shortly afterward.

Works. Worn out by the exertions of an active career, Eugene died in 1736. Posterity has endeavoured to add to his military glory the reputation of scientific, artistic, and literary interests. But, although he is known to have corresponded with the philosopher Gottfried Wilhelm Leibniz, his literary interests cannot have been overwhelming, because not one of the tens of thousands of volumes in his library (most of them preserved in the Nationalbibliothek in Vienna) bears any trace of having been much used, and they give the appearance of having been opened hardly at all in the more than 200 years since Eugene neglected to read them. Regarding his interest in architecture and painting, it may be said that, although he commissioned great artists to build and beautify his palaces, he involved himself in these matters no more than was expected of any great lord of his time. Aside from the enormous, in fact uncanny, talent with which he led the Emperor's armies to victory, Eugene had a weakness for comic ruses. At the siege of Philippsburg, for example, he intended to change the course of the Rhine so that it would flow through the French camp, an idea that caused him to laugh uproariously; at Belgrade, he had the Austrian flotilla, which had lain at anchor above the city, move through various canals so that it suddenly appeared below the city. He also indulged in primitive soldiers' pranks—a failing that made him many enemies among his victims. The only subject that held his attention as much as politics was finances, not only public monies (he was also imperial minister of finance) but also and especially his own—he had arrived in Austria with 25 guilders, and he left an estate of about 25,000,000.

Eugene I–IV (popes): see Eugenius I–IV.

Eugenia, large genus of chiefly tropical, mostly aromatic, evergreen shrubs and trees of the myrtle family (Myrtaceae). The leaves are opposite; the flowers are solitary or in small clusters. The fruit is an edible berry, usually tart, and is commonly made into jam or jelly. Some Asian species, formerly considered part of the genus, may be listed under *Syzygium*.

Syzygium aromaticum (sometimes *E. caryophyllata*), the clove tree, which occurs in the

West Indies and Indonesia, produces flowers that are removed as buds, dried, and sometimes processed to yield clove oil. The whole clove and its extract are used in flavouring;

Surinam cherry (*Eugenia uniflora*)

Walter Daxn

the oil is also used medicinally (see clove). Many species of *Eugenia* yield high-grade lumber. The bark of *E. cymosa* of Indonesia is the source of a black dye. Other species are widely used in the tropics and subtropics as ornamentals.

eugenics, the study of human improvement by genetic means.

A brief treatment of eugenics follows. For full treatment, see MACROPAEDIA: Genetics and Heredity, The Principles of.

Proposals for ameliorating undesirable qualities of the human race date from ancient times. Plato's *Republic* depicts a society in which there is an effort to improve human beings through selective breeding. The first thorough exposition of eugenics, however, was made by the English scientist Francis Galton, a pioneer in the use of statistics. In his first important book, *Hereditary Genius* (1869), Galton proposed that a system of arranged marriages between men of distinction and women of wealth would eventually produce a gifted race. He coined the term eugenics in 1883 and continued to expound its benefits until his death in 1911.

The American Eugenics Society, founded in 1926, supported the proposition that the wealth and social position of the upper classes was justified by a superior genetic endowment. U.S. eugenicists also supported restrictions on immigration from nations with "inferior" stock, such as Italy, Greece, and countries of eastern Europe, and argued for the sterilization of insane, retarded, and epileptic citizens in the United States. As a result of their efforts, sterilization laws were passed in more than half of the U.S. states, and isolated instances of involuntary sterilization continued into the 1970s. The assumptions of eugenicists came under sharp criticism beginning in the 1930s and were discredited after the German Nazis used eugenics to support the extermination of Jews, blacks, and homosexuals.

Since the 1950s there has been a renewed interest in eugenics. Because certain diseases (e.g., hemophilia and phenylketonuria) are now known to be genetically transmitted, many couples choose to undergo genetic screening, in which they learn the chances that their offspring might be affected by some combination of their hereditary backgrounds. Couples at risk of passing on genetic defects may opt to remain childless or to adopt children. Furthermore, it is now possible to di-

agnose certain genetic defects in the unborn. Many couples choose to terminate a pregnancy that involves a genetically disabled offspring. These developments have reinforced the eugenic aim of identifying and eliminating undesirable genetic material. Counterbalancing this trend, however, has been medical progress that enables victims of many genetic diseases to live fairly normal lives. Genetic surgery, in which harmful genes are altered by direct manipulation, is also being studied; if perfected, it could obviate eugenic arguments for restricting reproduction among those who carry harmful genes. Such conflicting innovations have complicated the controversy surrounding eugenics. Moreover, suggestions for expanding eugenics programs, which range from the creation of sperm banks for the genetically superior to the potential cloning of human beings, have met with vigorous resistance from the public, which often views such programs as unwarranted interference with nature or as opportunities for abuse by authoritarian regimes.

Eugénie, in full EUGÉNIE, COMTESSE (countess) DE TEBA, original name EUGÉNIA MARÍA DE MONTUJO DE GUZMÁN (b. May 5, 1826, Granada, Spain—d. July 11, 1920, Madrid), wife of Napoleon III and empress of France (1853–70), who came to have an important influence on her husband's foreign policy.

Eugénie, detail of a portrait by Franz Xaver Winterhalter, in the Collection de Mouchy, Paris

Giraudon—Art Resource/EB Inc

The daughter of a Spanish noble who fought on the French side during Napoleon I's Peninsular War in Spain, Eugénie went to Paris when Louis-Napoléon became president of the Second Republic in December 1848. They were married in January 1853 after he had become the emperor Napoleon III.

On March 16, 1856, Eugénie gave birth to an imperial heir, Napoléon-Eugène-Louis Bonaparte. Concerned about the future of her family line, she began to take an active role in political affairs. On at least three occasions she served as regent (1859, 1865, 1870) in her husband's absence and was certainly more than just a figurehead. A devoted Roman Catholic, she supported Ultramontane causes (favouring a strong papacy) and opposed her husband's Italian policies that resulted in a loss of temporal power for the pope. She is often credited with having a preponderant voice in the decision to create a French-sponsored kingdom of Mexico (1861).

Eugénie, especially sensitive because of her origins, supported French opposition to a Prussian candidate for the vacant Spanish throne, in the controversy that precipitated the Franco-German War of 1870. After the Battle of Sedan (Sept. 1, 1870) she joined her

family in exile in England and, after the death of her husband (1873), continued to play a dominant role in Bonapartist political activities. When her son died (1879), she assumed the role of the grande dame in exile.

Eugenikos, Markos (b. c. 1392, Constantinople—d. June 23, 1445, Constantinople). Greek Orthodox metropolitan of Ephesus (near modern Selçuk, Tur.) and theologian who led the anti-unionist party in the Eastern Orthodox Church following the Council of Florence, Italy (1439).

After a classical and theological education under tutors antagonistic to Rome, Eugenikos at 26 gave his property to the poor and became a monk on the Greek island of Antigone. Forced to return to Constantinople in 1422 because of Muslim harassment, he stayed at the urban monastery of Mangani, where he gained a reputation for learning and sanctity. Groomed for the Council of Florence by the Byzantine emperor John VIII Palaeologus (1425–48), Eugenikos was made metropolitan of Ephesus c. 1436 and represented the patriarchs of Antioch and Alexandria at the council. In Florence he delivered most of the addresses allotted to the Greek Orthodox and became increasingly firm in his repudiation of Western teaching, particularly on the Holy Spirit. He demanded that the Latins remove the *Filioque* ("and from the Son") phrase from the Nicene Creed and accused them of falsifying scriptural and patristic texts in order to buttress their dogma.

Refusing to sign the council's final document of reunion, Eugenikos returned to Constantinople to organize anti-unionist opposition. He was imprisoned for two years after vainly attempting to seek refuge at the monastery on Mt. Athos. Released, he resumed his anti-Western campaign, handing over this responsibility on his deathbed to Georgios Scholarios, the future patriarch Genadius II.

Among Eugenikos' writings are a confession of faith (creedal summary), interpretations of the Church Fathers, a critique of Latin doctrine on the Trinity, and a refutation of the Western Church's use of unleavened bread in the Communion service. He particularly contested the Western teaching on purgatory. Eugenikos also composed treatises on liturgical subjects, in which he faulted the Western rite, and wrote several tracts on ascetical themes. He was officially proclaimed a saint by the Greek Orthodox Church in 1734.

Eugenius, English EUGENE, name of Roman Catholic popes, grouped below chronologically and indicated by the symbol •

• **Eugenius I, SAINT** (b. Rome—d. June 2, 657, Rome; feast day June 2), pope from 654 to 657. He was elected while his predecessor, Pope St. Martin I, was still alive in exile. Later, in a letter of September 655, Martin acknowledged Eugenius to be the legitimate pope. The Byzantine emperor Constans II Pogonatus urged Eugenius to recognize Patriarch Peter of Constantinople, but Eugenius refused because Peter was a Monothelite—*i.e.*, advocator of a condemned doctrine proposing that Christ had only one will. Eugenius was buried at St. Peter's.

• **Eugenius II** (b. Rome—d. Aug. 27, 827, Rome), pope from 824 to 827. He was a cardinal priest when chosen as successor to St. Paschal I. In 824 Eugenius received the Holy Roman co-emperor Lothair I, who had come to Rome to issue the *Constitutio Romana* that affirmed imperial sovereignty over Rome, demanded an oath of fealty from Eugenius, and vested papal election in the Roman clergy and nobles, subject to imperial confirmation. Eugenius opposed a revival in the Eastern Church of the Iconoclastic Controversy, a long-standing theological dispute over the worship of icons.

• **Eugenius III, BLESSED**, original name BERNARD OF PISA, Italian BERNARDO DI PISA, or BERNARDO PAGANELLI DI MONTMAGNO? (b. near Pisa—d. July 8, 1153, Tivoli, near Rome; beatified 1872; feast day July 8), pope from 1145 to 1153.

Possibly a member of the family Paganelli di Montemagno, he was a disciple of St. Bernard of Clairvaux and a Cistercian abbot of the monastery of SS. Vincent and Anastasius when he was elected on February 15. Eugenius, like others of western Europe, was shocked by the fall of Edessa, the capital of the first crusader state, in 1144. With Rome in a state of anarchy, by early 1146 Eugenius was forced into exile by his archenemy, the Italian reformer Arnold of Brescia. While in France (1147) he urged King Louis VII the Young to lead a crusade for the liberation of Edessa, naming Bernard as its preacher. The Second Crusade, most impressive of all in scope, ended in failure.

Eugenius returned to Italy in June 1148 and in July excommunicated Arnold, who denounced Eugenius as "a man of blood" and spread the revolt against him. Away from Rome under its hostile new Senate during much of his reign, Eugenius held many councils. He concluded the Treaty of Constance (1153) with the Holy Roman emperor Frederick I Barbarossa, fixing conditions for his imperial coronation, but the Pope died before Frederick could come to Italy.

• **Eugenius IV**, original name GABRIELE CONDULMER (b. c. 1383, Venice—d. Feb. 23, 1447, Rome), pope from 1431 to 1447.

Formerly an Augustinian monk, he was a cardinal when unanimously elected to succeed Martin V. His pontificate was dominated by his struggle with the Council (1431–37) of Basel, which assembled to effect church reform. When Eugenius sought to dissolve the council because of its hostility toward the papacy, its members affirmed superiority over

Eugenius IV crowning the emperor Sigismund, detail from a bronze relief by Filarete, on the doors of St. Peter's, Rome

Alinari—Art Resource/EB Inc

the Pope (1433). The conflict between Eugenius and the council eased as a possibility emerged of reuniting the Roman and Greek churches. The Greeks preferred negotiating with the Pope and wished to meet in Italy. Eugenius thus ordered the council to transfer to Ferrara in 1438. Many of the bishops obeyed, but dissidents stayed on at Basel as a rump council, whose members Eugenius excommunicated. They, in turn, promptly "deposed" him.

Meanwhile, on July 7, 1438, King Charles VII of France issued, against Eugenius' will, the Pragmatic Sanction of Bourges, a pronouncement—prompted by the decrees of the Council of Basel—that established certain liberties for the French Church and advocated restriction of papal power. A plague forced the council at Ferrara to move to Florence, where a union of the Greek and Roman churches

(though short-lived) was concluded on July 6, 1439. Eugenius' success at the Council of Ferrara-Florence enabled him to defy the Basel assembly, thus ending the rump council and restoring papal sovereignty to the church.

Euglena, genus of single-celled organisms with both plant and animal characteristics. It is considered a member of the protozoan order Euglenida or a member of the algal division Euglenophyta. The genus is characterized by an elongated cell (15 to 500 micrometres,

Euglena gracilis (highly magnified)
Walter Dawn

or 0.0006 to 0.02 inch) with one nucleus, pigment-containing chloroplasts (some species are colourless), a contractile vacuole, an eyespot (stigma), and flagella. Certain species (e.g., *E. rubra*) appear red in sunlight because they contain a large amount of pigment. Some species, which lack a rigid cellulose wall, have a flexible pellicle (envelope) that allows changes in shape. Food, absorbed directly through the cell surface or produced by photosynthesis, is stored as a complex carbohydrate (paramylum). Reproduction is asexual, by longitudinal cell division; sexual reproduction is unknown. *Euglena* live in fresh and brackish water rich in organic matter. Some species develop tremendous populations as green or red "blooms" in ponds or lakes. Several species produce resting cysts that can withstand drying. The colourless species are used to study cell growth and metabolism at high temperatures, in the dark, in ultraviolet light, or with certain chemicals.

Euhemerus, also spelled EUEMEROS, or EVE-MERUS (fl. 300 BC), Greek mythographer who established the tradition of seeking an actual historical basis for mythical beings and events. It is thought he was born at Messina, though some claim he was born at Chios, Tegea, or Messene in the Peloponnese. He lived at the court of Cassander, king of Macedonia, from approximately 301 to 297 BC. He is chiefly known by his *Sacred History*, a philosophic romance based upon archaic inscriptions that he claimed to have found during his travels in various parts of Greece.

In this work he systematized for the first time an old Oriental (perhaps Phoenician) method of interpreting the popular myths; he asserted that the gods were originally heroes and conquerors who had earned a claim to the veneration of their subjects. This system spread widely, and the early Christians, especially, used it as a confirmation of their belief that ancient mythology was merely an aggregate of fables of human invention.

The word euhemeristic is applied to such explanations of primitive myths. There is no doubt an element of truth in this approach, for, among the Romans, the gradual deification of ancestors and emperors was a prominent feature of religious development. Among primitive people, it is sometimes possible to

trace family and tribal gods back to great chiefs and warriors. But it is not accepted by students of comparative religion as the sole explanation of the origin of gods.

eulachon, also called CANDLEFISH, species of smelt (*q.v.*).

Eulaeus River (Iran): see Kārūn River.

Eulalius (d. 423), antipope from December 418 to April 419. He was an archdeacon set up against Pope St. Boniface I by a clerical faction. The rivalry that ensued led to the first interference of the temporal authorities in papal elections. Both the Pope and the Antipope were asked by Emperor Honorius to leave Rome pending a council's decision, but Eulalius (the imperial favourite) imprudently returned to perform the Holy Week services at the Lateran. For this defiance of the Emperor's orders, he was rejected and exiled to the Campania, where he died in obscurity.

Eulenburg, Botho (Wend August), Graf zu (count of) (b. July 31, 1831, near Bartenstein, Prussia—d. Nov. 5, 1912, Berlin), Prussian statesman associated with the Conservative Party in imperial Germany.

As Prussian minister of the interior (1878–81), Eulenburg formulated Bismarck's laws against the Social Democrats and presented them to the imperial Reichstag. In 1892 he became prime minister of Prussia, succeeding the imperial chancellor, Leo, Graf von Caprivi, who from 1890 had held both offices. When Caprivi attempted to liberalize the Prussian franchise, Eulenburg demanded imperial legislation against the Social Democrats and tried to persuade the emperor, William II, to restrict universal suffrage for the imperial Reichstag. The conflict between Eulenburg and Caprivi typified the struggle between Junker Prussia and democratic Germany; the Emperor "resolved" the problem by abruptly dismissing them both in 1894. In 1899 Eulenburg entered the Prussian Herrenhaus (House of Lords).

Eulenburg, Philipp, Fürst zu (prince of), in full PHILIPP FRIEDRICH KARL ALEXANDER BOTHO, FÜRST ZU EULENBURG UND HERTEFELD, GRAF (COUNT) VON SANDELS (b. Feb. 12, 1847, Königsberg, Prussia—d. Sept. 17, 1921, Liebenberg, Ger.), diplomat and intimate friend and adviser of the German emperor William II.

After leaving the army, Eulenburg entered the diplomatic service (1877) and served as secretary to the Prussian mission in Munich (1881–88). A close friend of William II since 1886, he became the Emperor's most influential adviser after Bismarck's fall (1890). In 1894 he refused the chancellorship but went as ambassador to Vienna (1894–1902). In 1901 he was created Graf von Sandels. Eulenburg's career ended tragically when the publicist Maximilian Harden printed (1906) in his paper *Die Zukunft* a series of attacks on Eulenburg's private life. He was accused of homosexuality and, although the charges were

Philipp, Fürst zu Eulenburg, 1898
By courtesy of the Staatsbibliothek West Berlin

never proved, the ensuing scandal seriously damaged the monarchy's prestige. Eulenburg's works include *Aus 50 Jahren* (1923; "Reminiscences of 50 Years") and *Mit dem Kaiser als Staatsmann und Freund auf Nordlandreisen*, 2 vol. (1931; "With the Emperor as Statesman and Friend on Travels in Scandinavia").

Eulenkügel, south German mid-16th-century owl jugs. Few examples of this early faience are known, and they range in date from 1540 to 1561. Originating in Nürnberg, the vessels are shaped as owls, with detachable head (to be used as a cup), molded relief feathers painted in blue, and a coat-of-arms in relief on the breast, gilded and coloured. It has been suggested that *Eulenkügel* might have been used as prizes in archery contests or that the owl form was a potter's joke, a play on the Rhenish word *Eulner*, or *Ulnar* ("potter").

Eulenspiegel, Till, Low German DYUL-LEN-SPÉGEL, German peasant trickster whose

Till Eulenspiegel (left foreground) in "How Owlglass Turneth Doctor," an illustration from *The Marvellous Adventures of Master Tyll Owlglass*, by Kenneth R.H. Mackenzie, 1869

By courtesy of the Folklore Society Library University College, London, photograph R.B. Fleming

merry pranks were the source of numerous folk and literary tales. The historical Till is said to have been born at Kneitlingen, Brunswick, and to have died in 1350 at Mölln, Schleswig-Holstein, where his gravestone has been pointed out since the 16th century. Anecdotes associated with his name were printed about 1500 in one or more Low German language versions. The earliest extant text is a High German version, *Ein kurtzweilig lesen von Dyl Vlenspiegel* (Antwerp, 1515; "An Amusing Book About Till Eulenspiegel"); the sole surviving copy is in the British Museum, London. The jests and practical jokes, which generally depend on a pun, are broadly farcical, often brutal, sometimes obscene; but they have a serious theme. In the figure of Eulenspiegel, the individual gets back at society; the stupid yet cunning peasant demonstrates his superiority to the narrow, dishonest, condescending townsman, as well as to the clergy and nobility.

The Low German text, or parts of it, was translated into Dutch and English (c. 1520), French (1532), and Latin (1558). A later En-

glish version, *Here beginneth a merye Jest of a man that was called Howleglas*, appeared c. 1560. Eulenspiegel has been the subject of musical and literary works, notably Richard Strauss's symphonic poem *Till Eulenspiegels lustige Streiche* (1894; "Till Eulenspiegel's Merry Pranks") and Gerhart Hauptmann's epic poem *Till Eulenspiegel* (1928).

Euler, Leonhard (b. April 15, 1707, Basel, Switz.—d. Sept. 18, 1783, St. Petersburg, Russia), Swiss mathematician and physicist, one of the founders of pure mathematics. He not only made decisive and formative contributions to the subjects of geometry, calculus, mechanics, and number theory but also developed methods for solving problems in observational astronomy and demonstrated useful applications of mathematics in technology and public affairs.

Euler's mathematical ability earned him the esteem of Jean Bernoulli, one of the first mathematicians in Europe at that time, and of his sons Daniel and Nicolas. In 1727 he moved to St. Petersburg, where he became an associate of the St. Petersburg Academy of Sciences and in 1733 succeeded Daniel Bernoulli to the chair of mathematics.

By means of his numerous books and memoirs that he submitted to the academy, Euler carried integral calculus to a higher degree of perfection, developed the theory of trigonometric and logarithmic functions, reduced analytical operations to a greater simplicity, and threw new light on nearly all parts of pure mathematics. Overtaxing himself, Euler in 1735 lost the sight of one eye. Then, invited by Frederick the Great in 1741, he became a member of the Berlin Academy, where for 25 years he produced a steady stream of publications, many of which he contributed to the St. Petersburg Academy, which granted him a pension. In 1748, in his *Introductio in analysin infinitorum*, he developed the concept of function in mathematical analysis, through which variables are related to each other and in which he advanced the use of infinitesimals and infinite quantities. He did for modern analytic geometry and trigonometry what the *Elements* of Euclid had done for ancient geometry, and the resulting tendency to render mathematics and physics in arithmetical terms has continued ever since. He is known for familiar results in elementary geometry; for example, the Euler line through the orthocentre (the intersection of the altitudes in a triangle), the circumcentre (the centre of the circumscribed circle of a triangle), and the barycentre (the "centre of gravity," or centroid) of a triangle. He was responsible for treating trigonometric functions—i.e., the relationship of an angle to two sides of a triangle—as numerical ratios rather than as lengths of geometric lines and for relating them, through the so-called Euler identity ($e^{i\theta} = \cos \theta + i \sin \theta$), with complex numbers (e.g., $3 + 2\sqrt{-1}$). He discovered the imaginary logarithms of negative numbers and showed that each complex number has an infinite number of logarithms.

Euler's textbooks in calculus, *Institutiones calculi differentialis* in 1755 and *Institutiones calculi integralis* in 1768–70, have served as prototypes to the present because they contain formulas of differentiation and numerous methods of indefinite integration, many of which he invented himself, for determining the work done by a force and for solving geometric problems; and he made advances in the theory of linear differential equations, which are useful in solving problems in physics. Thus, he enriched mathematics with substantial new concepts and techniques. He introduced many current notations, such as Σ for the sum; f_n for the sum of divisors of n ; the

symbol e for the base of natural logarithms; a , b , and c for the sides of a triangle and A , B , and C for the opposite angles; the letter " f " and parentheses for a function; the use of the symbol π for the ratio of circumference to diameter in a circle; and i for $\sqrt{-1}$.

After Frederick the Great became less cordial toward him, Euler in 1766 accepted the invitation of Catherine II to return to Russia. Soon after his arrival at St. Petersburg, a cataract formed in his remaining good eye, and he spent the last years of his life in total blindness. Despite this tragedy, his productivity continued undiminished, sustained by an uncommon memory and a remarkable facility in mental computations. His interests were broad, and his *Lettres à une princesse d'Allemagne* in 1768–72 were an admirably clear exposition of the basic principles of mechanics, optics, acoustics, and physical astronomy. Not a classroom teacher, Euler nevertheless had a more pervasive pedagogical influence than any modern mathematician. He had few disciples, but he helped to establish mathematical education in Russia.

Euler devoted considerable attention to developing a more perfect theory of lunar motion, which was particularly troublesome, since it involved the so-called three-body problem—the interactions of Sun, Moon, and Earth. (The problem is still unsolved.) His partial solution, published in 1753, assisted the British Admiralty in calculating lunar tables, of importance then in attempting to determine longitude at sea. One of the feats of his blind years was to perform all the elaborate calculations in his head for his second theory of lunar motion in 1772. Throughout his life Euler was much absorbed by problems dealing with the theory of numbers, which treats of the properties and relationships of integers, or whole numbers (0, ± 1 , ± 2 , etc.); in this, his greatest discovery, in 1783, was the law of quadratic reciprocity, which has become an essential part of modern number theory.

In his effort to replace synthetic methods by analytic ones, Euler was succeeded by J.-L. Lagrange. But, where Euler had delighted in special concrete cases, Lagrange sought for abstract generality; and, while Euler incautiously manipulated divergent series, Lagrange attempted to establish infinite processes upon a sound basis. Thus it is that Euler and Lagrange together are regarded as the greatest mathematicians of the 18th century; but Euler has never been excelled either in productivity or in the skillful and imaginative use of algorithmic devices (i.e., computational procedures) for solving problems.

(C.B.B.)

BIBLIOGRAPHY. A bibliography of Euler's works, compiled by Gustav Enestrom in "Verzeichnis der Schriften Leonhard Eulers," *Jahresbericht der Deutschen Mathematiker-Vereinigung, Ergänzungsband IV* (1910–13), lists 856 books and articles. An edition of *Leonhardi Euleri Opera omnia*, begun in 1911 and still continuing, will comprise 72 volumes in three series: mathematics, 29 vol.; mechanics and astronomy, 31 vol.; physics and miscellaneous, 12 vol. The texts appear in the original language of publication, in most cases Latin; but introductions, sometimes substantial, are in the language of the editors. There is a large body of secondary literature on Euler, chiefly in German and Russian. See, for example, Otto Speiss, *Leonhard Euler* (1929). The most authoritative account in English, together with an extensive bibliography, is that by A.P. Youschkevitch in the *Dictionary of Scientific Biography*, vol. 4, pp. 467–484 (1971). A less substantial summary is found in Carl B. Boyer, "The Age of Euler," in *A History of Mathematics* (1968). For Euler's contributions to specialized aspects of mathematics, see such works as Carl B. Boyer, *History of Analytic Geometry* (1956) and *History of the Calculus and Its Conceptual Development* (1959); and Leonard E. Dickson, *History of the Theory of Numbers*, 3 vol. (1919–23, reprinted 1952).

Euler(-Chelpin), Ulf (Svante) von (b. Feb. 7, 1905, Stockholm—d. March 9, 1983, Stockholm), Swedish physiologist who, with British biophysicist Sir Bernard Katz and U.S. biochemist Julius Axelrod, received the 1970 Nobel Prize for Physiology or Medicine. All three were honoured for their independent study of the mechanics of nerve impulses.

Euler was the son of 1929 Nobel laureate Hans von Euler-Chelpin. After his graduation from the Karolinska Institutet in Stockholm, Euler served on the faculty of the institute from 1930 to 1971. He joined the Nobel Committee for Physiology and Medicine in 1953 and was president of the Nobel Foundation for 10 years (1965–75).

Euler's outstanding achievement was his identification of noradrenaline, the key neurotransmitter (or impulse carrier) in the sympathetic nervous system. He also found that noradrenaline was stored within nerve fibres themselves. These discoveries laid the foundation for Axelrod's determination of the role of enzymes in nerve activity.

In addition to the Nobel Prize, Euler's honours include the Swedish Order of the North Star and the Stouffer Prize for his work related to hypertension and arteriosclerosis.

Euler characteristic, in mathematics, a number, C , which is a characterization of the various classes of geometric figures based only on the topological relationship between the numbers of vertices, V , edges, E , and faces, F , of a geometric figure. This number, given by $C = V - E + F$, is the same for all figures the boundaries of which are composed of the same number of connected pieces (i.e., the boundary of a circle or figure eight is of one piece; that of a washer, two). For all simple polygons (i.e., without holes) the Euler characteristic equals one. This can be demonstrated for a general figure by the process of triangulation, in which auxiliary lines are drawn connecting vertices so that the region is subdivided into triangles (see Figure, top). The triangles are then removed one at a time from the outside inward until only one remains, the Euler characteristic of which can be easily calculated to equal one. It can be observed that this process of adding and removing lines does not alter the Euler characteristic of the original figure, and so it must also equal one. For any simple polyhedron (in three dimensions), the Euler characteristic is two, as can be seen by removing one face and "stretching" the remaining figure out onto a plane, resulting in a polygon, with a Euler characteristic of one (see Figure, middle). Adding the missing face gives a Euler characteristic of two.

For figures with holes, the Euler characteristic will be less by the number of holes present (see Figure, bottom), because each hole can be thought of as a "missing" face. In alge-

Examples of Euler characteristic

braic topology, there is a more general formula called the Euler-Poincaré formula, which has terms corresponding to abstract higher-dimensional figures and also terms (called Betti numbers) specifying what the Euler characteristic should be for a particular class of figures, varying according to the number of holes and twists in the figure. The Euler characteristic, named for the 18th century Swiss mathematician Leonhard Euler, was used to show that there are only five regular polyhedra (*i.e.*, with all faces congruent).

Euler-Chelpin, Hans (Karl August Simon) von (b. Feb. 15, 1873, Augsburg, Ger.—d. Nov. 7, 1964, Stockholm), Swedish biochemist who shared the 1929 Nobel Prize for Chemistry with Sir Arthur Harden for work on enzymes in the fermentation of sugar.

After graduating from the University of Berlin (1895), Euler-Chelpin worked with Walther Nernst and in 1897 became assistant to Svante Arrhenius at the Royal Institute of Technology in Stockholm. He joined the faculty at

Euler-Chelpin
Bavaria Verlag

the University of Stockholm (1900), where he became professor of general and inorganic chemistry (1906) and director of the new biochemical institute (1929).

Euler-Chelpin's work with coenzymes advanced knowledge of the biochemistry of sugar and phosphates. He also helped elucidate the chemical structures of several vitamins.

eulite, silicate mineral belonging to the orthopyroxene (*q.v.*) series.

Eumenes (Greco-Roman mythology): *see* Fury.

Eumenes (b. c. 362 BC—d. 316), Greek general who upheld the cause of the Macedonian royal house in the civil war that followed the death of Alexander the Great in 323.

Ancient sources agree that Eumenes was an extremely able general. In the distribution of the empire after Alexander's death, he was assigned Cappadocia in eastern Asia Minor. He gave valuable aid to the regent Perdiccas, Alexander's legitimate successor, in Perdiccas' struggle against the rebel Macedonian generals Antigonus Monophthalmus, Antipater, Craterus, and Ptolemy, each of whom controlled different parts of the empire. After the murder of Perdiccas by his own men, the rebel generals gathered at Tripardisus (321) and condemned Eumenes to death. He escaped but was recognized two years later by the new regent (Polyperchon) as the royal general in Asia. Eumenes collected an army in Cilicia and marched toward the eastern provinces, pursued by Antigonus. Eumenes held Antigonus in check during a long and hard campaign on the Iranian plateau, but he was finally betrayed to the enemy and put to death.

Eumenes I (d. 241 BC), ruler of Pergamum, in Mysia, from 263 to 241 who, in 262, liberated his city from the overlordship of

the Seleucids, a dynasty founded in Syria by one of the successors of Alexander the Great. Eumenes succeeded his uncle Philetaerus in 263 and in the following year defeated the army of the Seleucid king Antiochus I near Sardis (the capital of Lydia), thereby establishing an independent city-state.

Eumenes II (d. 160/159 BC), king of Pergamum from 197 until his death. A brilliant statesman, he brought his small kingdom to the peak of its power and did more than any other Attalid monarch to make Pergamum a great centre of Greek culture in the East.

Eumenes was the eldest son and successor of Attalus I Soter (ruled 241–197), and he continued his father's policy of cooperation with Rome. His military skill contributed substantially to the victory of Roman and Pergamene forces over the Seleucid king Antiochus III in the battle of Magnesia, in Lydia (autumn of 190). As his reward Eumenes was given control over the Thracian Chersonese (modern Gallipoli peninsula in European Turkey) and over most of the former Seleucid possessions in Asia Minor. Despite this enlargement of his domain, Eumenes realized that his power rested on Roman might. He therefore cultivated friendship with the Romans, securing their intervention in his struggles against the kings of Bithynia and Pontus, in northern Anatolia.

In 172 Eumenes visited Rome to denounce Perseus, the king of Macedonia, for allegedly plotting aggressions in the East. He then joined the Romans in their struggle against Perseus (Third Macedonian War, 171–168), but when the war dragged on it was rumoured that Eumenes was negotiating secretly with the enemy. Whatever the truth of the report, the mere suspicion of disloyalty was enough to put Eumenes permanently in the shadow of Rome's displeasure.

Eumenes was responsible for the construction of nearly all the main public buildings—together with their splendid sculptures—on the acropolis at Pergamum.

Eumenides (Greek mythology): *see* Fury.

Eumenius (fl. c. AD 300), Roman orator and teacher of rhetoric, born in Augustodunum, Gaul (now Autun, Fr.), who was the author of *Oratio pro instaurantis scholis* ("Oration on the Restoration of the Schools"), an interesting document on the education of his time as well as a vigorous panegyric of Emperor Constantius Chlorus. The oration was delivered in 298 to promote the restoration of the university college at Augustodunum, which, like the city, had been damaged in the disturbances and siege of 269. The oration actually amounts to an expression of appreciation to the emperor Constantius Chlorus for his plans for reconstruction, which included appointment of Eumenius as principal of the college. Though Eumenius had been promised double the normal salary for his position, a means of maintaining his status since he had formerly been Constantius' private secretary, he declared that he would donate these emoluments to the reconstruction fund.

From the 16th century onward, other contemporary speeches in the collection of *Panegyrici Latini* have been ascribed to Eumenius—but without evidence or probability. In his remaining oration the frigid affectations of panegyric are enlivened by personal enthusiasm.

Eumolpus, mythical ancestor of the priestly clan of the Eumolpids at Eleusis, a city in ancient Greece, and the site of the Eleusinian Mysteries, the best known of the Greek mystery cults. His name (meaning "good" or "strong singer"; *i.e.*, a priest who could chant his litanies clearly and well) was a personification of the clan's hereditary functions. His legend fluctuated so greatly that three identities for Eumolpus have been assumed:

1. Being a "sweet singer," he was connected with Thrace, the country of Orpheus (*q.v.*). He was the son of the god Poseidon and Chione (Snow Girl), daughter of the north wind, Boreas; after various adventures he became king in Thrace but was killed while helping the Eleusinians in their war against Erectheus of Athens.

2. As one of the originators of the Eleusinian Mysteries, he was an Eleusinian, a son of Earth (Ge), father of Keryx, and the mythical ancestor of the Kerykes (Heralds).

3. Because Orpheus and his followers were closely connected with mysteries of all sorts, Eumolpus was believed to be the son, father, or pupil of Musaeus, a mythical singer closely allied with Orpheus.

Eunan, SAINT: *see* Adamnan, Saint.

Eunapius (b. c. 345, Sardis, Lydia—d. c. 420), Greek rhetorician and historiographer whose *Lives of the Philosophers and Sophists* is important as a source of information on contemporary Neoplatonism (edited with Latin translation by J.F. Boissonade, 1849; with English translation by W.C. Wright, *Philostratus and Eunapius*, 1922).

Eunapius was educated under the rhetorician Praeresius and was initiated into the Eleusinian mysteries. Eunapius was an ardent opponent of Christianity. He also wrote a supplement to the *Chronological History* of Publius Herennius Dexippus, continuing the history from AD 270 to 404. Of this work only fragments remain.

Eunomius (b. c. 335, Cappadocia, Asia Minor—d. c. 394, Dakora, Cappadocia), extreme proponent of Arianism (*q.v.*). With the Arian philosopher and bishop Aëtius, he established the Eunomian sect (*see* Anomoeans), which, although it had an ecclesiastical organization (centred on Constantinople) and several bishops, did not long survive Eunomius.

After serving as secretary to Aëtius in Alexandria, Eunomius accompanied him to Antioch and was ordained deacon there. In 360 or later he was made bishop of Cyzicus in Mysia but soon was deposed because of his teachings. Although his views were initially sustained in a conference at Sirmium in 357, he jeopardized his position by his extremism, particularly in his endorsement of the semi-Arianism (*q.v.*) of Bishop Macedonius of Constantinople. Eunomius' doctrines were attacked by St. Basil and were finally condemned by the Council of Constantinople in 381; he was forced to spend his last years in retirement on his family estate. Most of the extensive writings of Eunomius were burned in 398 at the order of the emperor Arcadius, but enough of his work remains to show the hairsplitting subtlety of his mind.

Eunosaurus, genus of extinct reptiles found as fossils in Middle Permian deposits of South Africa (the Permian Period began 280,000,000 years ago and lasted 55,000,000 years). It has been suggested that *Eunosaurus* may be the ancestral form from which the turtles evolved. The structure of *Eunosaurus* is unusual; the number of vertebrae in the backbone is small, a condition seen in the turtles, and these reptiles had eight pairs of very broad ribs almost

Ventral view of *Eunosaurus*

most touching each other, a condition that may foreshadow the development of the turtle carapace, or shell.

eunuch, castrated human male. From remote antiquity, eunuchs were employed in the Middle East and in China in two main functions: as guards and servants in harems or other women's quarters, and as chamberlains to kings. Eunuchs were considered the most suitable guards for the many wives or concubines a ruler might have in his palace, and the eunuchs' confidential position in the harems of princes frequently enabled them to exercise an important influence over their royal masters and even to raise themselves to stations of great trust and power. Some rose to become bodyguards, confidential advisers, and even ministers, generals, and admirals. Most eunuchs underwent castration as a condition of their employment, though others were castrated as punishment or after they had been sold by poor parents.

Eunuchs functioned as political advisers to the emperors of China as early as the Chou period (c. 1122–221 BC) and continued as such under the Han, T'ang, Ming, and Sung dynasties, persisting almost until the end of the imperial regime. At times palace eunuchs became more powerful than the emperor and effectively ruled China. Eunuchs were used as court advisers and officials in Persia under the Achaemenids (559–330 BC). The Roman emperors Claudius, Nero, Vitellius, and Titus employed eunuchs as such, as did most of the subsequent emperors of the Byzantine Empire. Indeed, many of the patriarchs of Constantinople during Byzantine times were eunuchs. Political eunuchs also flourished in the centres of Muslim power after AD 750, and as a class eunuch advisers only disappeared with the end of the Ottoman Empire in the early 20th century. The Italian practice of castrating boys in order to train them as adult soprano singers (castrati) was ended by Pope Leo XIII (1878).

Eunuchs who were emasculated voluntarily for the avoidance of sexual sin or temptation—the Christian theologian Origen (c. AD 185–c. 254) being the most celebrated example—have appeared in several Christian periods, basing their action on the text of Matthew 19:12; 5:28–30. The 3rd-century Valesii, a Christian sect of eunuchs, castrated themselves and their guests in the belief that they were thereby serving God.

Eunus (fl. second half of 2nd century BC), leader of a slave revolt against the Romans in Sicily from 135 to 132 BC.

A Syrian by birth, Eunus was a slave at Enna in Sicily, where he gained the confidence of other slaves in a revolt against their masters. Before long 70,000 slaves were organized into a fighting force. Enna was captured, and Eunus, who called himself King Antiochus, soon controlled much of central and eastern Sicily. The first armies that Rome sent against the rebels were severely defeated. The consul Lucius Calpurnius Piso managed to reach Enna in 133, however, and his successor, Publius Rupilius, completely suppressed the revolt in the following year. Eunus was captured and died in prison.

Euonymus, genus of about 170 species of shrubs, woody climbers, and small trees, in the staff tree family (Celastraceae), native to temperate Asia, North America, and Europe. The genus includes many popular landscape ornamental shrubs and ground covers.

Winter creeper euonymus (*E. fortunei*, or *E. radicans*), from East Asia, climbs by aerial rootlets; it has glossy, evergreen leaves and clusters of greenish flowers followed by orange fruits. Its many cultivated varieties include

Wahoo (*Euonymus atropurpurea*)

Clarence Cook from The National Audubon Society Collection/Photo Researchers

bigleaf, glossy, sarcoxic, baby, longwood, and purpleleaf, widely used in landscaping.

The winged spindle tree (*E. alata*), also called burning bush (*q.v.*), is a handsome shrub with corky winged stems. The common spindle tree (*E. europaea*), which grows to 6 m (20 feet), keeps its pink and orange fruits after the leaves fall. In eastern Europe gutta-percha resin is extracted from this plant. The wood is used for pegs and spindles. Several varieties of the spindle tree are grown as ornamentals.

Another species called burning bush is *E. atropurpurea*, also known as wahoo, from eastern North America; it is similar to *E. europaea* but has reddish fruits. The strawberry bush (*E. americana*) from the same region is lower and has pinkish fruits.

Euparkeria, extinct genus of reptiles that may have been ancestral to the major reptilian groups of the Mesozoic era; specimens are found as fossils in Early Triassic rocks of South Africa (245 to 240 million years ago). *Euparkeria* was about 1 m (3 feet) long and

Euparkeria

Reprinted by permission of the World Publishing Company from *The Procession of Life* by Alfred S. Romer

lightly built. It probably was equally adept at progressing on all four limbs or with the body balanced on the hind legs; the hind limbs were longer and stronger than the forelimbs. Many of the bones were hollow; the very long tail served as a counterbalance when the animal stood upright. The skull was slender and light, with many sharp, well-developed teeth in the margins of the jaws and on the palate as well, a primitive feature.

Eupatorium, large genus of plants belonging to the family Compositae and containing about 600 species, nearly all American and found chiefly in tropical South America, the West Indies, and Mexico. They are mostly perennial herbs, but a few are annuals, and many of the tropical species are shrubby or treelike. Members of the genus typically bear large, showy clusters of purplish, pink, blue, or white flowers. Some species are found in the United States and Canada, among them bone-set (*E. perfoliatum*), which grows to a height of 1.5 m (5 feet) and bears white flowers; and joe-pye weed (*E. purpureum*), which reaches 2.7 m (9 feet) and has purplish flowers. The white snakeroot (*E. rugosum*) is a poisonous herb common in the central and western United States. Cattle allowed to pasture on this plant may suffer muscular tremors and weakness, a disorder called trembles.

eupatrid (Greek: "of a good father"), member of the nobility of ancient Athens. It is likely that public office before 594 BC was in practice confined to the eupatridae and that they had a political monopoly comparable to that of other Greek aristocracies in the Archaic period. Solon's reforms, by establishing property qualifications for office, limited their power, which disappeared entirely after 580.

Eupen-et-Malmédy, region in Verviers *arrondissement*, Liège province, Wallonia région, Belgium. Eupen-et-Malmédy lies along the border with Germany and consists of the so-called *cantons rédimés* ("redeemed cantons") of Eupen, Malmédy, and Sankt Vith. Until 1794 the region was part of the duchy of Limbourg, the ecclesiastical principality of Stavelot-Malmédy, and the duchy of Luxembourg. Under French rule from 1794 to 1814, it belonged to the Ourthe *département* (the present Liège province). Most of the region was annexed by Prussia as a result of the Treaty and Congress of Vienna (1815). It included Moresnet, which was much contested because of its zinc mines and which was divided—one part being given to Prussia, one to The Netherlands, and the third part becoming a condominium called Neutral Moresnet. After World War I, the Versailles treaty assigned Eupen, the district of Malmédy and Sankt Vith, Prussian Moresnet, and Neutral Moresnet to Belgium. This was ratified by plebiscite (1920), and Germany recognized the new frontier in the Pact of Locarno (1925).

The territories were occupied by Nazi Germany from 1940 until the liberation of Belgium (1944), although some of the heaviest fighting of World War II went on there through January 1945, when the region was a principal locus of the Battle of the Bulge.

Postwar frontier adjustments and land transfers between Belgium and West Germany in 1949 and 1958 (confirmed by an agreement signed in 1956) brought the area of the territories to about 410 square miles (1,060 square km). Most of the inhabitants speak German. Since 1963 Eupen-et-Malmédy has existed as a German-language region composed of two geographic entities. One, around Eupen, comprises the communes of Eupen, Kelmis, Lontzen, and Raeren; the other, around Sankt Vith, consists of Amel, Büllingen, Burg-Reuland, Bütgenbach, and Sankt Vith. The Malmédy region is French-speaking but with facilities for the use of German; it consists of the communes of Malmédy and Waimes. Eupen is the seat of Belgium's German-speaking Community, which is a locally elected council responsible for culture, education, the media, medicine, and the use of languages.

The region is mostly forest and moorland, with areas cultivated for fodder. Eupen produces cloth, electric cables, metal wires, chocolates, and soap. Malmédy (*q.v.*) has a prosperous paper industry and brewery. Sankt Vith is a noted cattle market, and furniture is made there.

Euphemites, extinct genus of gastropods (snails) abundant during the Late Carboniferous epoch (between about 325,000,000 and

280,000,000 years ago) in the shallow seas that covered the midcontinental region of North America. *Euphemites* was a small, globular snail with a broad and arcuate (bow-shaped) aperture. Ornamentation consists of parallel ridges separated by troughs following the plane of coiling.

euphonia, any of several tropical American birds of the tanager family. *See* tanager.

euphonium, also called **BARITONE**, German **BARYTON**, brass wind instrument with valves, pitched in C or B \flat an octave below the trumpet; it is the leading instrument in the tenor-bass range in military bands. It was invented in 1843 by Sommer of Weimar and derived from the valved bugle (flügelhorn) and cornet.

Euphonium, c. 1850
By courtesy of Boosey & Hawkes Ltd

It has a wide conical bore resembling that of the tuba and is held vertically with the bell upward (in the United States the bell is often positioned to face forward on the instrument). It normally carries a fourth valve in addition to the essential three, in order to take the compass continuously down to the fundamental pitches below the bass staff. (Without the fourth valve there would be a gap between the two lowest notes producible.) The total compass rises from the third B \flat below middle C to about the C above it. Its notation is generally in the bass clef at actual pitch in military bands and treble clef a ninth above the actual sound in brass bands. In duplex, or double, euphoniums, there is an alternative bell and a tubing that may be switched in by a valve to supply a lighter tone quality.

The euphonium is closely related to the tuba, which it resembles in shape and for which it often serves as a tenor. It also resembles the baritone, with which it is identical in range, although the euphonium's wide bore gives it a different tone quality.

euphony and cacophony, sound patterns used in verse to achieve opposite effects: euphony is pleasing and harmonious; cacophony is harsh and discordant. Euphony is achieved through the use of vowel sounds in words of generally serene imagery. Vowel sounds, which are more easily pronounced than consonants, are more euphonic; the longer vowels are the most melodious. Liquid and nasal consonants and the semivowel sounds (l, m, n, r, y, w) are also considered to be euphonic. An example may be seen in "The Lotos-Eaters" by Alfred, Lord Tennyson: "The mild-eyed melancholy Lotos-eaters came." Cacophony, the opposite of euphony, is usually produced by combinations of words that require a staccato, explosive delivery. Inadvertent cacophony is a mark of a defective style. Used skillfully for a specific effect, however, it vitalizes the content of the imagery. A line in

Samuel Taylor Coleridge's "Rime of the Ancient Mariner" illustrates cacophony:

With throats unslaked, with black lips baked,
Agape they heard me call.

Euphorbia, large and variable genus of shrubs, trees, and herbaceous plants, in the spurge family (Euphorbiaceae), characterized by a milky sap. The genus, which contains some 1,500–1,600 species, is also commonly called spurge (*q.v.*).

Euphorbiaceae, the spurge family of flowering plants, in the order Euphorbiales, containing some 7,500 species in 275 genera. Many members are important food sources; others are used for their waxes and oils and as a source of medicinal drugs; dangerous for their poisonous fruits, leaves, or sap; or attractive for their colourful bracts (leaflike structures located just below flower clusters) or unusual forms. Although species of the family grow throughout the world, except in cold alpine or arctic regions, most of them are found in temperate and tropical regions. The family consists of annual and perennial herbs and woody shrubs or trees, rarely climbers.

Flowers are of one sex, with male and female flowers usually borne on the same plant. Petals are rarely present. Flowers of *Euphorbia* are in cup-shaped clusters called cyathia, each of which seems to be a single female flower, consisting of a single pistil surrounded by several male flowers, each of which has a single stamen. These clusters of reduced flowers are enclosed by an involucre (whorl) of bracts (modified leaves) that resembles a corolla, or whorl of flower petals.

Male flowers of the other genera have one to many stamens, free or joined. Female flowers have three-chambered ovaries that are superior (that is, above and not enclosed by other flower parts). There are as many styles as there are ovary cavities. The fruit is a three-chambered capsule. Leaves are usually simple and are alternate (or rarely opposite or whorled) in arrangement along the stems. The stems of many species contain a milky latex.

Members of the family known for beauty or usefulness include the largest genus, *Euphorbia*, commonly called spurge (*q.v.*), with a wide range of succulent plants from lawn weeds to cactuslike plants; ornamentals such as *Codiaeum*, sandbox tree (*Hura*), copperleaf (*Acalypha*), *Phyllanthus*, redbird cactus (*Pedilanthus*), *Jatropha*; and economically important plants such as castor-oil plant (*Ricinus communis*), croton (*Croton tiglium*), *Omphalea*, cassava (*Manihot esculenta*), rubber (*Hevea*), tung tree (*Aleurites*; a source of candlenut oil), and tallow tree (*Sapium*). The manchineel tree (*Hippomane mancinella*) bears poisonous fruits, and mercury (*Mercurialis*) is a weed in many areas.

Euphorbiales, diverse order of flowering plants, belonging to the class known as Magnoliopsida (dicotyledons); characterized by two seed leaves. The order contains the very large family Euphorbiaceae, the closely related small family Pandaceae, and two additional small families of more doubtful relationship, Buxaceae (boxwood) and Simmondsiaceae (jobo). Members of this order yield rubber, edible roots and fruits, medicinal and poisonous compounds, and ornamental plants. They are most abundant in the tropics but are widely distributed throughout the world except in arctic and alpine zones.

A brief treatment of Euphorbiales follows. For full treatment, *see* MACROPAEDIA: Angiosperms.

The unifying features of Euphorbiales are simple leaves (except in a few species), reduced size of flowers, an ovary that rises above the other flower parts (superior position), and few ovules in each ovary chamber. In both habit and habitat, the order is extremely diverse.

The spurge family (Euphorbiaceae), one of

the larger families of dicotyledons, consists of about 275 genera and about 7,500 species. Its members are distributed worldwide and contribute significantly to the economies of many nations. Cassava, also called yuca, or manioc, is a shrub of South American origin (*Manihot esculenta*) now cultivated in many tropical lowlands of West Africa and other areas for its edible roots. Tapioca is one of its starchy products. Other members of Euphorbiaceae yield products including commercial waxes (*Sapium sebiferum*), rubber (*Hevea*), lumber (*Bischofia*), tung oil (*Aleurites fordii*), and castor oil (*Ricinus communis*).

Ornamental plants of the Euphorbiaceae, prized for their colour at flowering time, include the poinsettia (*Euphorbia pulcherrima*), originally from tropical Mexico and Central America. It is widely sold during the Christmas season in North America. Its showy bracts are foliage leaves that surround clusters of flowers; only the leaves nearest the flowers turn colour. Species of *Codiaeum*, often known as crotons, are prized for their variegated foliage. *Acalypha wilkesiana*, or Jacob's-coat, produces bronze-green leaves spotted in colours of copper, red, or purple.

The second largest family of the Euphorbiales, the Buxaceae, is largely evergreen and ornamental; its best-known members are the cultivated boxwoods. The family Pandaceae has 4 genera and 18 species of trees, found in tropical areas. One species, *Panda oleosa*, produces oilseeds. The family Simmondsiaceae is entirely composed of *Simmondsia chinenses*, the fruit of which yields jojoba oil, a substitute for the sperm oil obtained from whales.

The diversity of stem habit and structure in the Euphorbiales is extreme. Heights range from cushion plants a few centimetres tall to those measuring 30 m (100 feet). Some are globose, spiny succulents, difficult to distinguish from cacti until flowers appear.

Leaf size and shape varies greatly. In most species, a small stipule (bladlike unit) is present basally, on each side of the petiole. Most leaves of the Euphorbiales are evergreen, with some notable exceptions in the spurge family, species of which lack leaves altogether.

Weedy perennials, such as the leafy spurge, propagate by rhizomes (underground, horizontal stems) that bear many buds. Although many other special cases of fragmentation occur in some species of Euphorbiales, seeds are overwhelmingly the most important method of reproduction in all families.

Flowers in the Euphorbiales may arise singly in the axil of a leaf (upper angle between petiole and stem). In most members, however, several flowers are clustered into various types of inflorescences, from elongate spikes and branched racemes to compact heads. With few exceptions, flowers are either male or female (unisexual); both may be borne on the same plant, depending on the species. In *Euphorbia*, a cluster of flowers simulates a complete flower. Cross-pollination is the usual method of pollination, though coloured bracts, appendages, and glands of many species also attract a wide variety of pollinating insects. Only a few species are wind-pollinated. After pollination and fertilization, the ovule becomes the seed and the ovary the fruit.

Euphorion (b. c. 275 BC?), Greek poet and grammarian, of Chalcis in Euboea, whose poetry was highly regarded in Hellenistic literary circles and later among Catullus' generation of Roman poets in the 1st century BC.

Euphorion studied philosophy at Athens. Soon after 223 BC, Antiochus the Great, king of Syria, gave him the coveted post of royal librarian at Antioch. His works included small-scale epics (*epyllia*) on mythological themes, poetic invectives and epigrams, as

well as scholarly treatises. Surviving fragments reveal him as a plagiarist possessed of a willfully obscure and turgid style.

Euphrates Dam, also called **ṬABAQAḤ**, or **TABQA**, **DAM**, dam on the Euphrates River in north-central Syria. The dam, which is located 30 miles (50 km) upriver from the town of Ar-Raqqaḥ, was begun in 1968. Its construction prompted an intense archaeological excavation of the area around the town of Ṭabaqaḥ. The dam is of earth-fill construction, some 197 feet (60 m) high and 2.8 miles (4.5 km) long. It was completed in 1973, and the reservoir behind the dam, Lake Assad, began filling. The lake at its fullest extent is approximately 50 miles (80 km) long and averages 5 miles (8 km) in width. The accompanying power plant was completed in 1977. Electrification subsequently reached to even the remotest villages in Al-Jazirah (the area to the east of the Euphrates). Several irrigation schemes are associated with the project.

Euphrates River, Sumerian **BURANUNU**, Akkadian **PURATTU**, Old Persian **UFRAṬ**, Greek and Latin **EUPHRATES**, biblical **PERATH**, Arabic **FURĀṬ**, Turkish **FIRAT**, the largest river of western Asia, rising on the Armenian plateau in Turkey and flowing generally southeastward across Syria and southern Iraq, where it joins the Tigris River to form the Shaṭṭ al-'Arab, which empties into the Persian Gulf. The total length of the Euphrates is about 1,700 miles (2,700 km).

A brief treatment of the Euphrates River follows. For full treatment, see **MACROPAEDIA: Asia**.

The Euphrates may be divided topographically into three sections: (1) The upper Euphrates begins with two principal tributaries, the Kara ("Muddy"), the more northerly branch, and the Murat ("Clear"), the easterly branch. These two streams flow off the high Armenian plateau in a series of relatively wide valleys linked by narrow, deep gorges. They unite about 30 miles (50 km) northwest of the town of Elaziğ. From this highland confluence the Euphrates itself continues in a great reverse curve between major ranges of the Taurus Mountains of southern Turkey and drops nearly 1,000 feet (300 m) by the time that it emerges onto the Syrian plateau at the village of Samsat, Tur. (2) The middle Euphrates, from its emergence onto the Syrian plateau at Samsat to the Iraqi lowlands at Hit, is approximately 900 miles (1,500 km) long. The river occupies a typically steep-sided valley cut several hundred feet into the plateau surface, and the floodplain ranges from 2 to 4 miles (3 to 6 km) wide. The chief tributaries of the Euphrates, including the Al-Khābūr, join the river during this middle course. (3) The lower Euphrates emerges at Hit from the entrenched valley in the Syrian plateau and spreads out onto the plains of Iraq, where it decreases in both volume and velocity. In the dry climate of this region much water is lost by evaporation from the surfaces of the river and overflow marshes and by irrigation. There is widespread deposition of sediment on the delta plain, and the difficult drainage is accompanied by the extensive development of braided channels, marshes, and shallow permanent lakes; these absorb much of the flow of the Euphrates and fluctuate greatly according to the season. From Hit to Al-Musayyib there is a single channel. Between these points, at Al-Fallūjah, the Euphrates approaches most closely to the Tigris, giving support from ancient times to a city of some sort, today Baghdad. Just below Al-Musayyib the river divides into two branches, the more easterly, the Shaṭṭ al-Hillah, being a former main channel and the more westerly, the Shaṭṭ al-Hindiyah, carrying the present main stream. The two branches reunite near

As-Samāwah, 110 miles (175 km) from their beginning, and continue as a single stream to An-Nāsiriyyah. There the Euphrates divides into numerous channels and spreads out into marshy land and Lake al-Ḥammār, at the eastern end of which it merges with the Tigris. From this point onward the combined rivers, as the Shaṭṭ al-'Arab, flow 120 miles (193 km) to the Persian Gulf.

The irregularity in the seasonal and annual flow of the Euphrates has made the problem of controlling floods and providing adequate irrigation facilities especially difficult in Iraq. Over the centuries and especially in modern times, there has been developed a great array of embankments, dikes, reservoirs, dams, weirs, canals, and other drainage facilities.

The Euphrates made possible the great civilizations of southern Mesopotamia from Sumerian to 'Abbasid times. At the beginning of the 1st millennium BC, the valley was divided between the Babylonians in the south, the Aramaeans on the middle Euphrates, and the Hittites in the north. The Aramaean territory formed part of the late Assyrian empire. Later the Syrian Euphrates became the frontier between Rome and Parthia.

Euphronius (fl. c. 520–470 BC), one of the most celebrated Greek painters and potters of his time. He experimented with new ideas, forms, and designs within the context of the Archaic tradition. His signature has been identified on 17 vessels, 5 signed by him as painter and 12 as potter. Generally, Euphronius' earlier works were signed as painter and his later works as potter.

"Heracles and Antaeus," calyx krater by Euphronius, c. 510–500 BC; in the Louvre, Paris

Cliche Musees Nationaux, Paris

Among the vases signed by Euphronius as painter is one of Heracles wrestling Antaeus, dated about 510–500 BC and now in the Louvre, Paris; it has been praised for its excellent drawing. A kylix (shallow earthenware cup with stem and handles), now in the State Collections of Classical Art at Munich, is another example of Euphronius' work as painter (c. 510–500 BC). A young horseman is painted on the inside of the kylix. Heracles in combat with the triple-bodied Geryon is painted on the outside.

As a potter, Euphronius worked with some of the finest vase painters of his time. The paintings of several, among them Douris, Makron, Hyakynthos, and Onesimos, have been identified on vases signed by Euphronius. Most, however, were painted by the Panaitios Painter. The Pistoxenus Painter was another of the painters of Euphronius' pots. A white-ground cup, now in the State Museum of Prussian Culture, Berlin, signed by Euphronius as potter and Pistoxenus as painter, is the last known signed work by Euphronius. In terms of its style, it could not date earlier than 470 BC.

Eupolis (fl. 2nd half of 5th century BC, Athens), one of the leading Athenian poets of

the vigorous and satirical Old Comedy, and a rival of Aristophanes.

Eupolis grew up during the Peloponnesian War between Athens and Sparta, and his first play was produced in 429 BC. Of his work 19 titles and more than 460 fragments survive. Objects of his satire included the demagogues Cleon and Hyperbolus and the wealthy Callias and Alcibiades and their fashionable circle. In his last play, *The Demes*, written just after the disastrous Athenian expedition led by Alcibiades to Sicily (412 BC), he addressed himself with patriotic fervour to the problem of how the fortunes of Athens were to be restored. He died young, about 410 BC, probably on active service at the Hellespont.

Euratom: see European Atomic Energy Community.

Eure, *département*, Haute-Normandie *région*, northeastern France, in the eastern part of the historic province of Normandy, occupying 2,332 square miles (6,040 square km). It is bounded in the northeast by the mouth of the Seine River, which flows through its northwesterly section as it leaves the Paris Basin. Nowhere higher than 800 feet (270 m), Eure is broken up by its rivers into well-wooded plateaus. The Eure River flows into the Seine from the southeast after a course of 44 miles (71 km) in the *département*. Evreux, the capital, is on the Iton, a tributary of the Eure. The climate is mild, with moderate rainfall. Eure is one of the richest agricultural *départements* of France (cattle, horses, cereals, fruit, beetroots, and potatoes) and is noted for the richness of its milk and other dairy products. It has considerable light industry (textiles, building material, leather, chemicals, foodstuffs, and flour) in the valleys. The very active exploitation of quarries in the valley of the Eure has led to the development of almost continuous schemes utilizing the river's course. The most spectacular of the historic sites is the 12th-century ruin of Château Gaillard, built by Richard I the Lion-Heart, dominating the Seine and the town of Les Andelys. The *département* has three *arrondissements*—Evreux, Bernay, and Les Andelys—and is in the educational division of Rouen. Pop. (1990) 513,818.

Eure-et-Loir, *département*, Centre *région*, northwestern France, created from parts of the historic provinces of Orléanais and Normandy. Most of the *département* is situated in the Paris Basin. More than half of its area of 2,270 square miles (5,880 square km) is occupied by the treeless, grain-supporting (corn [maize] and wheat) plain of Beauce, interspersed with large villages and isolated farms. The northwest comprises the wooded and grassy Thimerais region, the northeast embraces part of the undulating Hurepoix, and the southwest is occupied by the hilly Perche. The *département* derives its name from the Eure River, which flows northward through Chartres, its capital, and from the Loir, which flows southward through Châteaudun. One of the main granaries of France, it has an essentially rural population. Its climate is mild and dry. Industry (flour milling, tanning, and the manufacture of agricultural machinery) has been little developed.

Historic sites include Chartres, with its world-famous cathedral, begun in the late 12th century and considered one of the finest examples of High Gothic architecture; Dreux, the burial place of the Orléans family; Maintenon, with a fine 14th–16th-century château presented by Louis XIV to Madame de Maintenon; and the beautiful 16th-century château of Diane de Poitiers, mistress of Henry II, in Anet. The *département* has four *arrondissements*—Chartres, Dreux, Châteaudun, and Nogent-le-Rotrou—and is in the educational division of Orléans. Pop. (1990) 396,073.

Eure River, river in northern France, a left-bank tributary of the Seine, with a length

of 140 miles (225 km). From its source in the Perche Hills, Orne *département*, at an elevation of about 800 feet (240 m), to its confluence with the Seine River above Rouen at Pont de l'Arche, it flows chiefly through agricultural and wooded regions, receiving numerous tributaries, including the Blaise, the Avre, and the Iton. It flows southeast from its source to the area south of Chartres, Eure-et-Loir *département*, and then turns sharply north, passing through the city of Chartres below the cathedral, which is located on high ground on the left bank. Continuing its northern course, the Eure flows through Maintenon, Dreux, and around Anet, veering northwest. After crossing Pacy-sur-Eure, in Eure *département*, it flows almost parallel to the Seine for more than 20 miles (32 km) before separating into several branches and flowing through the town of Louviers.

Eureka, city, port, and seat (1856) of Humboldt county, northern California, U.S. Lying on Humboldt Bay, Eureka is located 275 miles (440 km) north of San Francisco. It was laid out in 1850 and named for the Greek motto (meaning "I have found it") on the state seal. The site of Fort Humboldt (1853, now a state historic park) and the scene of several Indian uprisings (1853–65) and a massacre of Indian women and children (1860), it developed with the exploitation of nearby redwood forests and some mining activity. Eureka is a major lumber and commercial-fishing centre and headquarters for Six Rivers National Forest. Tourism and dairying are important, and the city also serves as a regional commercial and transportation centre. Eureka is the seat of the College of the Redwoods (1964; community college), and Humboldt State University (1913) is at nearby Arcata. Local attractions include Sequoia Park, with a zoo and a grove of virgin redwoods; Blue Ox Millworks and Historic Museum; and Humboldt Bay Maritime Museum, dedicated to North Coast maritime history. Humboldt Bay National Wildlife Refuge is nearby, and Humboldt Redwoods State Park, California's largest redwood state park, is 45 miles (70 km) due south of the city. Inc. 1856. Pop. (2002 est.) 25,866.

Eureka Stockade (Dec. 3, 1854), the most celebrated rebellion in Australian history. It involved the gold prospectors of Ballarat, Victoria, and was named for the rebels' hastily built fortification in the Eureka goldfield.

The rebellion was the culmination of longstanding grievances on the part of the miners, or "diggers," over exorbitant prospecting-license fees introduced in 1851, police brutality, lack of the vote and representation in the Legislative Council, and a prohibition against prospecting on crown lands. The murder of a digger named James Scobie in October 1854 and the acquittal of his alleged killers further inflamed the situation. Demonstrations and clashes with the police followed. On November 11 the diggers formed the Ballarat Reform League to petition the lieutenant governor, Charles Hotham, for redress of their grievances. Although Hotham's response was promising, the arrival of troop reinforcements on November 28 led to further clashes.

On November 30 many of the diggers organized themselves into military companies and subsequently began work on the stockade. Troops and police surrounded the 150 diggers who were within the structure on December 3. After refusing to come out, the diggers opened fire on the government forces but were quickly routed. None of the rebels accused of treason was convicted. The Eureka Stockade rising accelerated the enactment of reforms, which followed in 1855.

Euric (b. 420—d. 484), king of a great Visigothic realm (usually called the kingdom of Toulouse) in the western part of the Roman Empire that included what is now southwest-

ern France (south of the Loire and west of the Rhône) and most of Spain. He is best known for the code of law that bears his name, the Code of Euric.

Euric ascended the throne after assassinating his brother, King Theodoric II, at the Visigothic capital of Toulouse. He ruled as a federate of the Roman Empire until 475, when he withdrew and became an independent king. He continued to defy Roman authority by extending his boundaries in Gaul and on the Iberian Peninsula for the remainder of his reign. His forces built fortifications at several key locations throughout the empire. Those at the ancient city of Carcassonne in southwestern France are among the finest remains of medieval ramparts in Europe. The code of law that Euric had Roman jurists compile acknowledged the rights of his Roman as well as his Gothic subjects.

Euripides (b. c. 484 BC, Athens [Greece]—d. 406, Macedonia), last of classical Athens' three great tragic dramatists, following Aeschylus and Sophocles.

A brief treatment of Euripides follows. For full treatment, see *MACROPAEDIA: Greek Dramatists, Classical*.

Euripides was the son of Mnesarchus (or Mnesarchides) and Cleito; there is indirect evidence that his family was middle-class. The general impression of Euripides left by tradition is of a figure austere and unconvivial. He was accustomed to sit in a cave looking out to sea, a habit considered eccentric by his more sociable contemporaries. He took almost no part in Athens' public affairs. He was passionately interested in ideas, however, and he associated with Anaxagoras and other philosophers of his time. His acquaintance with new ideas brought him restlessness rather than conviction, and his questioning attitude toward the traditional Greek religion is reflected in many of his plays.

Euripides was first chosen to compete in the dramatic festival of Dionysus in 455 BC, and he won his first victory in 441. In all he competed on 22 occasions (four plays at each). In 408 he left Athens to live at the court of Archelaus, king of Macedonia, who was a noted patron of the arts. The fowness of his victories at the Dionysiac festivals, four in his lifetime and one posthumous, suggests some lack of appreciation.

Nineteen of Euripides' plays survive. Among the most notable are *Medea* (431 BC), *Hippolytus* (428), *Electra* (418), *Trojan Women* (415), *Ion* (413), *Iphigenia at Aulis* (406), and *Bacchants* (406). Euripides took the heroic figures of ancient legend and transformed them into ordinary people who have contemporary attitudes. His highly intellectualized dramas are rich in ethical and social commentary and generally make up in psychological realism what they lack in idealizing grandeur.

euro, monetary unit and currency of the European Union (EU). It was introduced as a non-cash monetary unit in 1999, and banknotes and coins appeared in participating countries on Jan. 1, 2002. After Feb. 28, 2002, the euro became the sole currency of member states. The euro is represented by the symbol €.

The euro's origins lie in the Treaty on European Union (1991), an agreement among the then 12 member countries of the European Community (now the European Union) that included the creation of an economic and monetary union (EMU). The treaty called for a common unit of exchange, the euro, and set strict criteria for conversion to the euro and participation in the EMU. Although several states technically did not meet the requirements, the European Commission (the executive branch of the EU) recommended their entry into the EMU, citing the significant steps each country had taken to qualify.

Although there were concerns regarding a single currency, including worries about coun-

terfeiting and loss of national sovereignty and national identity, 11 countries (Austria, Belgium, Finland, France, Germany, Ireland, Italy, Luxembourg, The Netherlands, Portugal, and Spain) formally joined the EMU in 1998. EU members Britain and Sweden delayed joining, and voters in Denmark narrowly rejected the euro in a September 2000 referendum. Greece initially failed to meet the economic requirements but was admitted in January 2001 after overhauling its economy. The participating countries became known as the euro area, euroland, or euro zone. (The euro is also the official currency in several places outside the EU, including Andorra, Montenegro, and San Marino.) In 1998 the European Central Bank (ECB) was established to manage the new currency. Based in Frankfurt, the ECB is an independent and neutral body headed by an appointed president who is approved by all member countries to serve an eight-year term.

The euro was launched on Jan. 1, 1999, replacing the ecu (a precursor of the euro) at a 1:1 value. Until the circulation of notes and coins in 2002, the euro was used only by financial markets and certain businesses. Many experts predicted that the euro could eventually rival the dollar as an international currency.

Unlike most of the national currencies that they replaced, euro banknotes do not display famous national figures. The seven colourful bills symbolize the unity of Europe and feature a map of the continent, the EU's flag, and arches, bridges, gateways, and windows. The eight euro coins feature a common design on one side and different designs from each participating country on the other.

Eurocommunism, trend among European communist parties toward independence from Soviet Communist Party doctrine during the 1970s and '80s. With Mikhail Gorbachev's encouragement, all communist parties took independent courses in the late 1980s, and by 1990 the term had become moot.

The term Eurocommunism was coined in the 1970s and received wide publicity after the publication of *Eurocomunismo y estado* (1977; "Eurocommunism and the State") by the Spanish communist leader Santiago Carrillo. The Eurocommunist movement avowedly rejected the subordination of all communist parties to the once-prevalent Soviet doctrine of one monolithic world communist movement. Instead, every party was expected to base its policies on the traditions and needs within its own country. The promotion of Eurocommunism seemed to coincide with the stagnation or decline of many European communist parties. Notably, in France, the once-powerful French Communist Party, which in the early postwar era was able to command about a third of the French popular vote, experienced a severe decline in later years. Its leader Georges Marchais and his comrades briefly flirted with Eurocommunism in the late 1970s—without any popular success. On the other hand, the Italian Communist Party remained Italy's second largest party, partly by stressing its independence of Moscow. Its foreign contacts and sympathies seemed to lie more with the European social democrats and labour parties, and in 1991 it changed its name to Democratic Party of the Left (shortened to Democrats of the Left in 1998). After the democratic revolutions of 1989, almost all the communist parties of eastern Europe became social democratic parties in spirit or name. Eurocommunism, in effect, had become the norm.

Eurodollar, a United States dollar that has been deposited outside the United States, especially in Europe. Foreign banks holding Eurodollars are obligated to pay in U.S. dollars when the deposits are withdrawn. Dollars

form the largest component of all currencies in which such deposits are held and which are generally known as Eurocurrency. The name originated in the early 1960s when eastern European countries wishing to hold dollar deposits outside the United States deposited them in European banks. Later the market involved many non-European countries.

By accepting a Eurodollar deposit, a bank actually receives a balance with a United States bank. The receiving bank is then able to make dollar loans to customers. Most such loans are used to finance trade, but many central banks also operate in the market.

Europa, in Greek mythology, the daughter either of Phoenix or of Agenor, king of Phoenicia. The beauty of Europa inspired the love of Zeus, who approached her in the form of a white bull and carried her away from Phoenicia to Crete. There she bore Zeus three sons:

Europa being abducted by Zeus disguised as a bull, detail from an Attic krater, 5th century; in the Tarquinia National Museum

By courtesy of the Museo Nazionale Tarquiniese, Tarquinia, Italy, photograph, Hirmer-Fotoarchiv, München

King Minos of Crete, King Rhadamanthus of the Cyclades Islands, and, according to some legends, Prince Sarpedon of Lycia. She later married the king of Crete, who adopted her sons, and she was worshiped under the name of Hecate in Crete, where the festival Hecateia was held in her honour.

Europa, also called JUPITER II, the smallest and second nearest of the four large moons (Galilean satellites) discovered around Jupiter by the Italian astronomer Galileo in 1610. It was probably also discovered independently that same year by the German astronomer Simon Marius, who named it after Europa of Greek mythology.

Europa has a diameter of 3,130 km (1,940 miles) and orbits Jupiter at a distance of about 670,900 km (416,900 miles). Its density of 3.0 grams per cubic centimetre indicates that it consists predominantly of rock with a fairly small proportion of frozen or liquid water. Models for the interior suggest the presence of an iron-rich core about 1,250 km (780 miles) in diameter surrounded by a rocky mantle, which is overlaid with an icy crust about 150 km (90 miles) thick.

Europa was first observed at close range in 1979 by the Voyager 1 and 2 spacecraft and then by the Galileo orbiter beginning in the mid-1990s. The satellite's surface is very bright and the smoothest of any known solid body in the solar system. The surface is crisscrossed by an intricate array of curvilinear grooves and ridges that create a tracery unlike anything else seen in the solar system. Their origin is unknown, but they may be fractures caused by

the stretching of Europa's crust due to tides raised by Jupiter's gravitational pull.

Images from Galileo revealed that in some areas the outermost ice layer has fractured and huge ice blocks have rotated from their original positions and even tilted before being refrozen in place. Evidently the subsurface layer was semifluid at some time in the past, although additional spacecraft missions are needed to tell when this happened and whether a subsurface ocean of water still exists. The partial melting of the ice could have been caused by tidal heating, a much milder expression of the same source of energy that powers the volcanoes of Io. Confirmation of the presence of liquid water and a long-term source of energy would open the possibility that some form of life exists on Europa.

Europa Canal: see Main-Danube Canal.

Europe, second smallest of the world's continents (after Australia), composed of the westward-projecting peninsulas of Eurasia and occupying nearly one-fifteenth of the world's total land area. It is bordered on the north by the Arctic Ocean, on the west by the Atlantic Ocean, and on the south (west to east) by the Mediterranean Sea, the Black Sea, the Kuma and Manyk rivers, and the Caspian Sea. The continent's eastern boundary (north to south) runs along the eastern Ural Mountains and the Emba River. Europe's islands and archipelagos include Novaya Zemlya, Iceland, the British Isles, Corsica, Sardinia, Sicily, Crete, Malta, and Cyprus. Its major peninsulas include the Scandinavian, Iberian, Italian, Balkan, and Jutland. Indented by numerous bays, fjords, and seas, continental Europe's highly irregular coastline is about 24,000 miles (38,000 km) long. Area 4,000,000 square miles (10,400,000 square km). Pop. (1991 est.) 718,500,000.

A brief treatment of Europe follows. Europe is treated in several articles in the MACROPAEDIA. For treatment of geography and economy, see Europe. For treatment of political and cultural history, see European History and Culture. For information about distinctive eras and aspects of European history, see Byzantine Empire, History of the; Crusades; European Overseas Exploration and Empires, History of; Greek and Roman Civilizations, Ancient; Holy Roman Empire, History of the; International Relations, 20th-Century; and World Wars.

Physical geography. The greater part of Europe combines low elevations with low relief; about three-fifths of the land is at an elevation of less than 600 feet (180 m) above sea level, and another one-third is between 600 and 3,000 feet (180 and 900 m). Europe can be divided into two major parts—western peninsular Europe and eastern continental Europe. And it can be divided into several distinct physiographic regions—the northwestern highlands, the lowlands, the central uplands and plateaus, the south-central mountains, and the southern fringe. The highland regions of extreme northern and northwestern Europe are marked by very old mountains and plateaus whose contours have been softened by prolonged erosion and glaciation. This region comprises much of Scandinavia, Iceland, Ireland, and Britain. More than half of Europe consists of lowlands; these include the East European Plain in the east (more than 2,000 miles [3,200 km] wide from north to south); the North European Plain, which covers Poland, northern Germany, southern Scandinavia, Belgium, The Netherlands, and northern and western France; the Romanian, Bulgarian, and Hungarian plains; and southern Finland. The central upland and plateau regions consist of eroded mountains and plateaus that are of medium age and generally have rounded landforms; these include the highlands of central and southern Germany, the Massif Central of France, the Meseta Cen-

tral of Spain, and the Bohemian Massif. To the south of these, and trending generally in a west-east direction, are a series of geologically young mountain systems containing Europe's highest elevations and most rugged relief. These mountain ranges include (from west to east) the Sierra Nevada, Pyrenees, Alps, Apennines, Carpathians, and the Balkan Mountains. The southern fringe of Europe is characterized by fragmented mountains, peninsulas, and islands.

Europe is a well-watered continent with many rivers but relatively few sizable lakes. Most of the continent's drainage finds its way to the Atlantic Ocean via a number of master river systems, whose watersheds interlock in a most complex manner. The river systems may be divided into three groups: the members of one drain west and north directly into the Atlantic and its marginal seas (*i.e.*, the North and Baltic seas); those of the second drain south into the Mediterranean; and those of the third drain east and southeast into the Black and Caspian seas. The Volga River is the continent's longest (2,193 miles [3,529 km]) river and has the largest drainage basin (525,000 square miles [1,359,750 square km]). Other major rivers are the Danube, Dnieper, Don, Rhine, Vistula, Elbe, Rhône, and Oder. Many of the major European rivers serve as transportation routes and are interconnected by networks of canals. Lakes, covering less than 2 percent of Europe's surface, are mostly of glacial origin. Lake Ladoga in northwestern Russia is the continent's largest freshwater lake (6,826 square miles [17,678 square km]). Glaciers cover an area of about 44,800 square miles (116,000 square km), mostly in the north.

Lying south of the Arctic Circle and north of the tropics, Europe exhibits a wide range of climates. The almost continuous mountain belt trending west-east across the continent impedes the interchange of tropical and polar air masses. Four major regional climate types can be distinguished: the maritime climate of the west with abundant rainfall and mild temperatures both in the winter and summer; the transitional climate of central Europe with 20 to 40 inches (500 to 1,000 mm) of annual rainfall, cold winters, and warm summers; the continental climate of the northeast with 10 to 20 inches (250 to 500 mm) of annual rainfall, long and cold winters, and hot summers; and the Mediterranean climate of southern coastal Europe with moderate rainfall (20 to 40 inches), mild and wet winters, and hot and dry summers.

The continent can be divided into five major vegetation belts (north to south). The narrow strip of the tundra zone is in extreme northern Russia, Scandinavia, and Iceland; there a thin cover of lichens, mosses, and a variety of grasses support reindeer (caribou), Arctic fox, and bear. The coniferous taiga, or boreal zone (spruce, fir, pine, willow, and larch), the most extensive forest zone in Europe, is located in northern Russia (north of the upper Volga River) and Scandinavia and is a prime source of Europe's timber. The deciduous mixed-forest zone (oak, maple, pine, beech, birch, elm, and linden) stretches across the continent from the British Isles to central European Russia; much of this area has been converted for human agriculture and in fact produces the bulk of Europe's cereals, vegetables, livestock, and dairy products. The steppe zone is in Ukraine and southeastern Russia, where grasslands have been almost completely replaced by crops such as wheat, corn (maize), and sugar beets. The Mediterranean zone of southern Europe harbours forests and secondary areas of scrub (maquis); most of the natural vegetation has been replaced by an agriculture based on wheat, olives, and grapes.

Roughly one-third of Europe is considered arable, a much larger proportion than the world average (excluding Antarctica) of 11

percent. About half of Europe's total arable land in the late 20th century was devoted to the production of cereals, principally wheat and barley. One-third of its total land area is forested, a considerable portion of it interspersed between agricultural and populated areas. Although pastureland accounts for less than one-fifth of Europe's total land, the continent supports substantial numbers of pigs, sheep, and cattle.

Europe is relatively poor in minerals with the exception of coal and some petroleum, natural gas, iron ore, lead, and zinc. Russia, on the other hand, is one of the most favourably endowed nations in the world in terms of mineral reserves, though many of these resources are beyond the Urals, in Asia, especially western Siberia. Western Europe has substantial reserves of petroleum (about 2 percent of the world's total reserves) and natural gas (about 4 percent of the world's total reserves), most of which is beneath the North Sea.

Human geography. The people of Europe constitute about one-seventh of the world's population. The vast majority of Europe's inhabitants belong to the European (or Caucasoïd) geographic race. Europe is the second most densely populated continent (after Asia), yet it has the lowest rate of natural increase. Although low mortality rates have been attained almost everywhere in the continent, birth rates are so low in some western and central European countries that their net population growth is at or near zero.

Western and central Europe are more densely populated than European Russia, but areas of Ukraine are also densely settled. The area of highest population density extends from England across northern France and the Low Countries to the Rhine-Ruhr region of Germany and southward to northern Italy. In general, Europe's population is highly urbanized, with the degree of urbanization increasing in proportion to the degree of industrialization. Thus the United Kingdom and Germany are among Europe's most urbanized countries, while Albania and Portugal are among its least urbanized.

Because of its long-standing habitation and the generally low mobility of most of its ethnic groups, Europe has many divisions of language and nationality. Most of Europe's approximately 60 native languages fall into one of three large divisions: Romance, Germanic, and Slavic, all of which are derived from a parent Indo-European language brought to the continent by early migrants from southwestern Asia. The Romance languages, which are derived from Latin, include French, Spanish, Portuguese, Italian, Romanian, and Romansch. The Germanic languages, which are derived from a common language that originated among ancient peoples in southern Scandinavia and Denmark, include German, English, Dutch (and Flemish), Danish, Norwegian, Swedish, and Icelandic. The Slavic languages are characteristic of eastern and southeastern Europe and include Russian, Polish, Czech, Slovak, Ukrainian, Belorussian, Bulgarian, Slovene, and Serbo-Croatian. Other languages include Greek (an Indo-European language), the Finno-Ugric languages, among which are Hungarian and Finnish, and various Turkic languages spoken in southeastern Europe.

Europe's population is overwhelmingly Christian in religion, with all three major divisions of that faith represented in large numbers. The Romance-language countries of Italy, Spain, and France, together with Ireland, Poland, Ukraine, and a few other parts of central and eastern Europe, are primarily Roman Catholic, while the United Kingdom and north-central and northern Europe are primarily Protestant. Eastern Orthodoxy is predominant in Russia and parts of the Balkan region. Groups of Muslims are scattered throughout Europe.

Europe has been a major source of emigrants for the settlement and economic development of the Americas, Australia, South Africa, and New Zealand. Since the early 1800s an estimated 60 million persons have emigrated overseas. Emigration was especially heavy between 1846 and 1932 and peaked in 1913, when at least 1.5 million persons emigrated from Europe. Although Europe is relatively densely populated, it continues to attract immigrants from other continents in search of employment and a higher standard of living.

Economy. Europe was the first of the world's major regions to develop a modern economy based on commercial agriculture and industrial development. It remains one of the world's major industrial regions, with average per capita income among the world's highest. The countries of western Europe in particular are among the world's most prosperous and highly developed, while those of southern and eastern Europe lag somewhat behind.

The economies of Europe's countries are predominantly market-oriented, with varying degrees of government intervention. Prior to the collapse of Soviet hegemony in eastern Europe—and of the Soviet Union itself—between 1989 and 1991, the former communist governments there maintained centrally planned economies. Since then these countries have faced the multiple tasks of introducing market mechanisms into their economies, overhauling their outmoded heavy industries, and hastening the growth of new consumer-goods and service industries.

Agriculture employs less than one-eighth of the workforce in most European countries, though its proportion of the labour force is considerably lower in western than in southern and eastern Europe. It is highly mechanized. Small family farms predominate in the west and south. Agriculture was collectivized in the east until the early 1990s, by which time the trend was toward privatization.

Agriculture on the North European Plain is dominated by the production of pasture and fodder crops (such as oats and barley), the raising of cattle for milk and meat, and the growing of wheat, vegetables, root crops (such as potatoes), and flowers. Agriculture in the Russian Plain, by contrast, concentrates more on cereal grains such as corn (maize) and spring wheat. Southern Europe specializes in fruits, vegetables, olives, and wines. Western Europe has the most productive and scientific agriculture, while inefficient methods in eastern Europe and a dry climate in southern Europe have hampered productivity.

Forestry is concentrated in Scandinavia and Russia. Europe's most productive fisheries are in the North Atlantic Ocean and the adjacent waters of the Norwegian Sea, the North Sea, and the Bay of Biscay. Russia, Norway, Denmark, Spain, and Iceland account for a large part of Europe's total catch of fish.

Europe's mineral industries are based largely on coal (mined primarily in European Russia, Ukraine, Germany, Poland, the United Kingdom, and the Czech Republic) and iron ore (mined primarily in Russia, Ukraine, France, Sweden, and Spain). Many European coal-fields are approaching depletion, however. The large-scale production of petroleum in Europe is limited largely to the offshore North Sea oil fields of the United Kingdom and Norway and to oil fields in Romania and Russia. Most European countries are heavily dependent on imported petroleum. The Netherlands, the United Kingdom, and Romania are the continent's leading producers of natural gas.

Europe generates about one-fourth of the world's total production of electricity. Of the total electricity generated in Europe, the bulk is derived from thermal-power plants, though more than a quarter is derived from nuclear power.

Europe's manufacturing industries are highly developed, though they depend to a large

extent on imported raw materials. Western Europe in particular has progressed beyond basic heavy industries into a post-industrial economic structure reliant on an array of service industries and the manufacture of high-quality machine and metal products, electrical goods, synthetic textiles, petrochemicals, motor vehicles, aircraft, computers, and consumer electronics. The economies of eastern Europe are considerably less advanced; they rely more heavily on basic iron and steel industries, textiles, and food processing and have markedly smaller service-industry sectors.

Europe accounts for approximately half of the world's international trade. Exports represent more than one-fifth of the aggregate gross national product (GNP) of the European Economic Area (EEA), which constitutes the world's largest free-trading bloc. Foodstuffs, petroleum, and raw materials dominate Europe's imports, while its exports include a great variety of capital and consumer goods, including machinery, motor vehicles, electronic equipment, chemicals, and textiles.

History. The continent of Europe had a scanty population of Neanderthals before being supplanted by modern humans approximately 40,000 years ago. Throughout its late prehistoric period, Europe continually received immigrants from Asia. These immigrants spoke Indo-European languages and were Bronze Age in culture and Caucasian in racial type. Agriculture and livestock raising first appeared in the Aegean Sea area about the end of the 7th millennium BC. By the middle of the 6th millennium, permanent settlements had begun to grow up in the southern Balkans. Farming expanded over much of central Europe during the middle of the 5th millennium BC. By the beginning of the 2nd millennium, the general population groups were in place from which emerged the historical peoples and nations of Europe.

A number of distinct peoples were established in Europe by about 1000 BC. The earliest Celts are believed to have inhabited an area that constitutes part of present-day France, southern Germany, and adjacent territory. Their culture spread as far as Britain and Ireland, central Europe, the Carpathians, and the Balkans.

The origins of the Germanic, or Teutonic, peoples are obscure. It is believed that by the late Bronze Age they inhabited southern Sweden, the Danish peninsula, and northern Germany. They also migrated south and west into areas inhabited by Celtic tribes.

A variety of communities existed in the grasslands that extended from the Black Sea northward outside the Carpathian Mountains as far as the Baltic Sea. The nomadic Scythians, who had ranged to the east of the Altai Mountains during the 9th century, migrated westward, in turn dislodging other tribes and settling in the Caucasus and the region to the north of the Black Sea.

The first leap toward civilization in Europe was made by the Greeks. Mycenaean civilization, centred in mainland Greece, can be dated from the middle of the 2nd millennium BC, when a branch of the Indo-Europeans intermingled with the populations of the Mediterranean region during the great migrations that started in the area of the lower Danube. Classical Greek civilization dates from about 900 BC. The Greeks traveled far and wide, founding colonies on the coasts and islands of Asia Minor, on the shores of the Black Sea, in Italy, and in northern Africa. They were in touch with the older advanced cultures of the Middle East and ultimately transmitted many features of these cultures to western Europe. With their own unique achievements, particularly in philosophy, mathematics, and natural science and in the evolution of the city-state,

the Greeks laid the foundation for European civilization.

By the mid-2nd century BC the Greeks had come under Roman control. Beginning in Italy, the Romans created a vast empire that, in Europe, covered all the Mediterranean countries, Spain, Gaul (mostly France), and southern Britain. Rome brought to the conquered parts of Europe the civilization the Greeks had begun, to which it added its own important contributions in the form of state organization, military institutions, and law. Within the Roman Empire there began the assimilation of varying types of culture to the Hellenistic-Roman pattern. The empire, operating under the *pax romana* ("Roman peace"), allowed free trade to flourish over a vast, interconnected region. It was under the Roman Empire that Christianity penetrated into Europe. As traditional Greco-Roman pagan culture declined during the later Roman Empire, the Christian church became the sole force able to arouse fresh creative strength by assimilating the civilization of the ancient world and transmitting it to the Middle Ages. The Roman Catholic and Eastern Orthodox churches, the most enduring legacy of the ancient world, were among the most significant features of European civilization.

Meanwhile, pressures from the Huns and other Central Asian peoples had by the 4th century AD begun to force the Goths, Burgundians, Franks, and other Germanic peoples westward into the Roman Empire proper. The Roman Empire in the west finally collapsed (AD 476) from the repeated incursions of these barbarians migrating from central and eastern Europe. There ensued an extensive breakdown of the fabric of classical civilization in western Europe during the early Middle Ages (sometimes called the Dark Ages), though the barbarians there eventually were converted to Christianity. The Greek, or eastern, half of the Roman Empire managed to survive as the Byzantine Empire, which preserved some of the civilization of antiquity and for centuries served as a bulwark against incursions by Central Asian and Muslim invaders.

In the early 9th century the Frankish ruler Charlemagne was able to consolidate his rule over a vast area of western Europe, and the division of the Carolingian empire between his grandsons was the starting point of the kingdoms and nations of France and Germany. From the 9th to the 10th century, the Vikings carried out raids and incursions throughout the whole of Europe, and as Normans they conquered England in 1066.

The related institutions of feudalism and manorialism arose in western Europe about the 9th and 10th centuries as a means of organizing the many small dynastic territories that had emerged after the collapse of centralized state authority. A backward agriculture could produce little more than the means of subsistence for most of the population, and there was little commerce, few towns, and no cities. Along with feudalism and a fragmented political system, the Middle Ages were characterized by the cultural and intellectual dominance of the Roman Catholic church, which preserved part of civilization's heritage in its monasteries and other centres of medieval learning.

From the 12th century, commerce began to revive throughout much of Europe, and towns sprang up once more. The Crusades, the growth of town life, and revived commerce all helped prepare the way for the period of cultural rebirth called the Renaissance in the 15th and early 16th centuries, which was marked by a revival of classical learning and the start of the modern European traditions of science, exploration, and discovery. Also significant were the 14th-century pandemics of the Black Death, which helped destroy feudal-

ism and usher in a money economy. One of the most important technological advances of the Renaissance was the development of printing with movable type. Politically, centralized nation-states emerged (especially England, France, Portugal, and Spain), and the Islamic Ottomans appeared, successfully wresting the Balkans from the rest of Christian Europe.

The Protestant Reformation of the 16th century ended the dominance of the Roman church over western and northern Europe and set off more than a century of warfare. Concomitant with this warfare was the growing desire to explore and expand abroad. The 16th century marked the beginning of the English, French, Dutch, Portuguese, and Spanish mercantile empires, which would imprint western European culture and institutions in all corners of the globe.

During the 16th and 17th centuries monarchical power was consolidated in the nations of western Europe at the expense of the nobility. A great period of monarchy emerged in Europe after the Peace of Westphalia (1648), which made clear the sovereign independence of the European state. Many wars were fought as the monarchs of Spain, France, England, Sweden, Poland, Russia, and Prussia struggled to acquire territory and wealth at each other's expense. The main supports of the monarchical system were the salaried officials, who were used to govern, and the mercenary armies, who projected the sovereign's military might.

The Enlightenment of the 17th and 18th centuries synthesized the insights of Renaissance humanism, the Protestant Reformation, and the developments of modern science into a new worldview stressing the primacy of reason and its application to questions of science, politics, government, law, ethics, and the arts. In the late 18th century, Enlightenment ideals helped spur the French Revolution, which toppled Europe's most powerful monarchy and spearheaded the movement toward democracy and equality. The revolution's immediate results, however, were short-lived. It was followed by Napoleon Bonaparte's tumultuous wars across Europe and the Congress of Vienna (1815), which strove for a conservative settlement of the various European political questions, based on the idea of a balance of power. The Congress' actions brought some measure of peace to Europe, but at the expense of the movement toward democracy, nationalism, and liberalism in many European countries.

Meanwhile, beginning in England in the late 18th century, the development of the steam engine, railroads, and factories marked the beginning of the Industrial Revolution and of an enormous increase in human productive capacity. By the mid-19th century, other European nations had begun to industrialize in an ever-quickenening process of technological change that would ensure Europe's military and political dominance over much of the world for the next century.

After the end of the Napoleonic Wars, Europe experienced almost a century of relative peace. Politically, perhaps the most important event in the second half of the 19th century was the unification of the German states (1870), under Prussian auspices, into a powerful new nation. By the early 20th century, the European powers had completed their overseas expansion and, threatened by the rising power of a unified Germany, had joined one of two great rival alliances: France, Britain, and Russia in one and Germany and Austria-Hungary in the other. These two alliances went to war in World War I (1914-18), which resulted in the fall of monarchies in Germany, Austria-Hungary, and Russia and the creation of a host of new nations from their former territories in central and eastern Europe. The war also provided an opportunity for communists to take power in Russia, which became the Soviet Union.

The bitterness and instability engendered in Germany by the peace settlement spawned the rise of Nazism, whose militaristic leaders engulfed Europe in World War II (1939-45) in an unsuccessful attempt to achieve German hegemony over the entire continent. Germany was defeated by an alliance of the Soviet Union, Britain, and the United States. World War II, however, marked the passing of world power from the states of Europe. In the aftermath of the war, the Soviets established control over the nations of eastern Europe and erected communist governments there. In response, western Europe allied itself with the United States, thus creating two sharply divided political blocs in the continent.

In the postwar decades western Europe experienced an unprecedented period of prosperity and economic growth, while eastern Europe industrialized using the Soviet economic and political model. The nations of western Europe initiated a process of economic and political integration that culminated in the establishment of the European Union in 1993. The Soviet Union's loss of control over eastern Europe in 1989-90 was followed by the collapse of communist governments in the region. The east-west division receded, but new states were created by the breakup of the Soviet Union, Yugoslavia, and Czechoslovakia.

Europe, Concert of, in the post-Napoleonic era, the vague consensus among the European monarchies favouring preservation of the territorial and political status quo. The term assumed the responsibility and right of the great powers to intervene and impose their collective will on states threatened by internal rebellion. The powers notably suppressed uprisings in Italy (1820) and Spain (1822) but later condoned Belgium's rebellion and proclamation of independence (1830).

Made obsolete in its original form by the revolutions of 1830 and 1848 and by the subsequent unifications of Italy and Germany, the Concert of Europe survived for most of the 19th century in the consultations among the great powers on territorial questions.

Europe, Council of, organization of representatives of more than 40 European states for the purpose of promoting European unity, protecting human rights, and facilitating social and economic progress. The Council was established on May 5, 1949, by 10 founding western European states (Belgium, Denmark, France, Ireland, Italy, Luxembourg, The Netherlands, Norway, Sweden, and the United Kingdom), later joined by 13 others (Austria, Cyprus, Finland, West Germany, Greece, Iceland, Liechtenstein, Malta, Portugal, San Marino, Spain, Switzerland, and Turkey). Since 1990, nearly 20 eastern European states have been admitted. Headquarters are in Strasbourg, France.

European Aeronautic Defence and Space Company (EADS), major European aerospace company that builds commercial and military aircraft, space systems, propulsion systems, missiles, and other defense products. It was formed in 2000 from the merger of three leading European aerospace firms: Aerospatiale Matra of France, DaimlerChrysler Aerospace (Dasa) of Germany, and Construcciones Aeronáuticas S.A. (CASA) of Spain. Headquarters are in Paris and Munich, Ger.

Measured by sales, EADS is the third largest aerospace company in the world (after Boeing and Lockheed Martin). It holds an 80-percent share in the consortium Airbus Industrie (*q.v.*) and is responsible for the final assembly of Airbus aircraft. EADS has a controlling interest in the joint venture Astrium (created 2000), the first trilateral space company, whose facilities in France, Germany, and Great Britain cover a full spectrum of the space business from ground systems and launch vehicles to satellites and orbital infrastructure. Its Euro-

copter subsidiary develops and builds military and civil helicopters. EADS also has stakes in Arianespace, which markets the commercial services of the Ariane family of launch vehicles; the Eurofighter consortium to develop a multirole combat aircraft; and the French aerospace firm Dassault.

Aerospatiale Matra was created in 1999 from the merger of Aerospatiale (itself formed in 1970 from a series of mergers and consolidations) with Matra Hautes Technologies (having roots in the aircraft industry dating to 1945). Dasa was formed in 1989, under the name Deutsche Aerospace AG, as a subsidiary of the German automobile maker Daimler-Benz AG. It became Daimler-Benz Aerospace (1995) and then DaimlerChrysler Aerospace (1998) to reflect the merger of its parent company with Chrysler Corporation. CASA, Spain's leading aerospace and defense company, was founded in 1923.

European Atomic Energy Community (EURATOM), international organization established by one of the Treaties of Rome in 1958 to form a common market for the development of the peaceful uses of atomic energy. The original members were Belgium, France, West Germany, Italy, Luxembourg, and The Netherlands. It subsequently has come to include all members of the European Union.

A major incentive for the creation of Euratom was to facilitate the establishment of a nuclear-energy industry on a European rather than a national scale. Other aims of the community were to coordinate research in atomic energy, encourage the construction of nuclear-power installations, establish safety and health regulations, encourage the free flow of information and the free movement of personnel, and establish a common market for trade in nuclear equipment and materials. Euratom's control was not extended to nuclear materials intended for military use.

European Coal and Steel Community (ECSC), administrative agency established by a treaty ratified in 1952, designed to integrate the coal and steel industries of France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg. In 1967 its governing bodies were merged into the European Community. It later came to include all members of the European Union (*q.v.*). When the treaty expired in 2002, the ECSC was dissolved.

European Community (EC), formerly (until Nov. 1, 1993) **EUROPEAN ECONOMIC COMMUNITY (EEC)**, byname **COMMON MARKET**, association created in 1957 by Belgium, France, Italy, Luxembourg, The Netherlands, and West Germany and designed to integrate the economies of Europe. The term also commonly refers to the European Communities, consisting of the EEC, the European Coal and Steel Community (*q.v.*; ECSC), and the European Atomic Energy Community (*q.v.*; Euratom). The EC is the principal component of the European Union (*q.v.*; EU). By the Treaty on European Union (*q.v.*; 1991) the EEC was renamed the EC and embedded into the EU.

European Court of Human Rights (ECHR), judicial organ established in 1959 that is charged with supervising the enforcement of the Convention for the Protection of Human Rights and Fundamental Freedoms (1950; commonly known as the European Convention on Human Rights), which was drawn up by the Council of Europe (*q.v.*). The convention obligates signatories to guarantee various civil and political freedoms, including the freedom of expression and religion and the right to a fair trial. It is headquartered in Strasbourg, Fr.

Individuals who believe their human rights have been violated and who are unable to remedy their claim through their national legal system may petition the ECHR to hear the case and render a verdict. The court, which

also can hear cases brought by states, may award financial compensation, and its decisions often require changes in national law. Consisting of more than 40 judges elected for renewable six-year terms, the ECHR normally works in seven-judge chambers. Judges do not represent their countries, and there is no limit to the number of judges a single country may contribute. A Grand Chamber of 17 judges is sometimes used in cases in which the seven-judge panel determines that a serious issue of interpretation is involved or that the decision of the panel might contravene existing case law.

In order to handle the growing number of cases more efficiently, a different court, bearing the same name, was established in 1998. It was merged with the European Commission of Human Rights (which was established in 1954) and enabled to hear individual cases without the prior assent of the individual's national government. The court's decisions are binding on all signatories. (J.G.Me./Ed.)

European Court of Justice (ECJ), also called **COURT OF JUSTICE OF THE EUROPEAN COMMUNITIES**, the judicial branch of the European Union (EU). The ECJ originated in the individual courts of justice established in the 1950s for the European Coal and Steel Community, the European Economic Community, and the European Atomic Energy Community. The function of these courts was to ensure the observance of law in those organizations' interpretation and application of their treaties. In 1958 a single, unified ECJ was created to serve all three of the European Communities (later called the European Community). In 1989 the Court of First Instance was established to reduce the court's workload.

The ECJ reviews the legality of the acts of the Commission and the Council of Ministers of the EU, which are the executive bodies of that organization. The court typically hears cases involving disputes between member states over trade, antitrust, and environmental issues, as well as issues raised by private parties, compensations for damages, and so on. The court has the power to invalidate the laws of EU member nations when those laws conflict with EU law. The ECJ serves as the final arbiter of the growing body of international law that accompanied the economic and political integration of Europe. The court's full bench consists of 25 judges, who are appointed to renewable six-year terms, and 8 advocates-general.

European Economic Co-operation, Organisation for (OECE): *see* Economic Co-operation and Development, Organisation for.

European Free Trade Association (EFTA), group of four countries—Iceland, Liechtenstein, Norway, and Switzerland—organized to remove barriers to trade in industrial goods among themselves, but with each nation maintaining its own commercial policy toward countries outside the group. Headquarters are in Geneva, Switz.

The member countries of the Organisation for European Economic Co-operation (OECE; 1948) originally proposed an OECE-wide free-trade area to which countries not wishing to join the European Economic Community (EEC; now part of the European Union) could belong and in which the EEC would function as one unit. When negotiations for this broke down in November 1958, the "outside" group, then composed of Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and the United Kingdom, decided to join together in the EFTA to strengthen their future bargaining power in establishing the wider free-trade area. The EFTA became operative in May 1960. In January 1973 Britain and Denmark became members of the EEC and left the EFTA. Portugal joined the EEC in 1986. Austria, Finland, and Sweden became members of the European Union (*q.v.*) in 1995.

The original convention committed the

members to a schedule of tariff reductions and quota liberalizations for industrial goods but also included provisions for escape if the burden imposed on domestic economics proved too great. Provisions also were made for bilateral agreements to liberalize trade in agricultural products. By 1967, import duties on most industrial goods had been abolished. In 1977 the EFTA entered into agreements with the EEC that established industrial free trade between the two organizations' member countries. In October 1991 the members of the EFTA and EEC agreed to establish a free-trade zone among themselves called the European Economic Area (EEA), which came into effect on Jan. 1, 1994. Switzerland (which did not ratify the agreement) and Liechtenstein (bound by its union with Switzerland) did not join the EEA at that time, though Liechtenstein became a full member the following year.

European Parliament, legislative assembly of the European Union (EU). The European Parliament, which was inaugurated in 1958 as the Common Assembly, consisted originally of members selected by the respective national parliaments of the member nations. Beginning in 1979, it became a legislature whose members (now totaling more than 700) were apportioned among the member nations and elected by direct universal suffrage.

Parliament members sit in political, rather than national, groups. The number of members per country varies depending on population. For example, Germany has 99 members, the most of any country, while Malta has only 5. The Parliament meets annually for about 12 one-week "part-sessions," in Brussels, Belg., or in Strasbourg, France.

Traditionally, the Parliament was only a consultative body. However, as integration has proceeded, its role has become more substantive in some areas. For example, the Parliament now exercises veto power in most areas relating to economic integration and budgetary policy. In some areas of significant concern to members, such as tax harmonization, its role is more marginal. The Parliament also serves as a democratic check on other EU institutions. In particular, it must approve and is empowered to remove the Commission president, who is the primary EU executive.

European Plain, one of the world's largest uninterrupted expanses of plain, stretching from the Pyrenees mountain range on the French-Spanish border across northern Europe to the Ural Mountains in Russia.

A brief treatment of the European Plain follows. For full treatment, *see* **MACROPAEDIA: Europe**.

In western Europe the plain is about 200 miles (320 km) in width and covers all of western and northern France, Belgium, The Netherlands, northern Germany, southern Scandinavia, and almost all of Poland. Eastward from northern France and Belgium it is commonly called the North European Plain. As it sweeps eastward the European Plain broadens until it reaches its greatest width, extending more than 2,000 miles (3,200 km) from the Black Sea to the Arctic Ocean, across Ukraine, Belarus, the Baltic states, and Russia. In the east the plain is called the East European, or Russian, Plain.

European Southern Observatory (ESO), astrophysical organization founded in 1962. Its activities are financially supported and administered by a consortium of eight European nations—Belgium, Denmark, France, Germany, Italy, The Netherlands, Sweden, and Switzerland. Headquarters are in Garching, Ger. ESO operates at two sites in Chile—the La Silla Observatory, located about 600 km (370 miles) north of Santiago at an altitude of 2,400 m

(7,900 feet), and the Very Large Telescope (Paranal Observatory) on Paranal, a 2,600-m (8,500-foot)-high mountain about 130 km (80 miles) south of Antofagasta.

European Space Agency (ESA). French AGENCE SPATIALE EUROPÉENNE (ASE), western European space and space-technology research organization founded in 1975 from the merger of the European Launcher Development Organisation (ELDO) and the European Space Research Organisation (ESRO), both established in 1964. Members include Austria, Belgium, Denmark, Finland, France, Germany, Ireland, Italy, The Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, and the United Kingdom. Canada signed a special cooperative agreement in 1981. Headquarters of the agency are in Paris.

The principal components of the organization are (1) the European Space Research and Technology Centre (ESTEC), located in The Netherlands, which houses the satellite project teams and testing facilities and is the agency's main space science and technological research centre; (2) the European Space Operations Centre (ESOC), located in Germany, which is concerned with satellite control, monitoring, and data retrieval; (3) the European Space Research Institute (ESRIN), located in Italy, which supports the ESA Information Retrieval Service and the Earthnet program, the system by which remote sensing images are retrieved and distributed; (4) the European Astronaut Centre (EAC), located in Germany, which is a training centre; and (5) the Centre Spatial Guyanais (CSG), located in French Guiana, which is a space launch centre.

European Union (EU), international organization comprising 25 European countries and governing common economic, social, and security policies. Originally confined to western Europe, the EU has expanded to include several central and eastern European countries. The EU's members are Austria, Belgium, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, The Netherlands, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, and the United Kingdom. The EU was created by the Treaty on European Union (*q.v.*), which went into force on Nov. 1, 1993.

Origins. The EU represents one in a series of efforts to integrate Europe since World War II. At the end of the war, several western European countries sought cooperative means to achieve economic growth and military security and to promote a lasting reconciliation between France and Germany. To this end, in 1951 Belgium, France, Italy, Luxembourg, The Netherlands, and West Germany founded the European Coal and Steel Community (*q.v.*; ECSC), which created a free-trade area for several key economic and military resources: coal, coke, steel, scrap, and iron ore. To manage the ECSC, the treaty established several supranational institutions: a High Authority to administer, a Council of Ministers to legislate, a Common Assembly to formulate policy, and a Court of Justice to interpret the treaty and to resolve related disputes. A series of further treaties and treaty revisions led eventually to the creation of the EU.

The European Economic Community. On March 25, 1957, the six ECSC members signed the two Treaties of Rome that established the European Atomic Energy Community (*q.v.*; Euratom) and the European Economic Community (*q.v.*; EEC). The EEC created a common market that featured the elimination of most barriers to the movement of goods, services, capital, and labour; the prohibition of most public policies or private agreements that inhibit market competition; a

common agricultural policy (CAP); and a common external trade policy.

The treaty establishing the EEC required member countries to eliminate or revise important national laws and regulations. In particular, it fundamentally reformed tariff and trade policy by abolishing all internal tariffs by July 1968. It also required that governments eliminate national regulations favouring domestic industries. Recognizing social policy as a fundamental component of economic integration, the treaty created the European Social Fund, which facilitated workers' geographic and occupational mobility.

Significantly, the treaty's common-market reforms did not extend to agriculture. The CAP, which was implemented in 1962 and which became the costliest and most controversial element of the EEC and later the EU, relied on state intervention to protect the living standards of farmers, to promote agricultural self-sufficiency, and to ensure a reliable supply of products at reasonable prices.

Like the ECSC, the EEC established four major governing institutions: a commission, a ministerial council, an assembly, and a court. In 1965 members of the EEC signed the Brussels Treaty, which merged the commissions of the EEC and Euratom and the High Authority of the ECSC into a single commission and combined the councils of the three organizations. The EEC, Euratom, and the ECSC, collectively referred to as the European Communities, later became the principal governing institutions of the EU.

The Commission is a permanent civil service. It is directed by commissioners who were originally appointed to renewable terms of four years; the terms were subsequently extended to five years. Headed by a president selected by the leaders of member countries, the Commission is responsible for formulating community policies. It has shared its agenda-setting role with the European Council, which consists of the leaders of all members. Established in 1974, the European Council meets at least twice a year to define the long-term agenda for European political and economic integration.

The main decision-making institution of the EEC and the EU has been the Council of Ministers (now the Council of the European Union), which consists of ministerial representatives. The Council's composition changes frequently, as governments send different representatives depending on the policy area under discussion. All community legislation requires the approval of the Council.

The Common Assembly, renamed the European Parliament (*q.v.*) in 1962, originally consisted of delegates from national parliaments. Beginning in 1979, members were elected directly to five-year terms. The size of member countries' delegations varies depending on population. The Parliament is organized into transnational party groups based on political ideology. Until 1987 it served only as a consultative body, though in 1970 it was given joint decision-making power (with the Council of Ministers) over expenditures.

The European Court of Justice (*q.v.*; ECJ) interprets community law, settles conflicts between the organization's institutions, and determines whether members have fulfilled their treaty obligations. Each member selects one judge, who serves a renewable six-year term. The ECJ has established two important legal doctrines. First, European law has "direct effect," which means that treaty provisions and legislation are directly binding on individual citizens, regardless of whether their governments have modified national laws accordingly. Second, community law has "supremacy" over national law in cases where the two conflict. Because national courts eventually accepted these legal doctrines, the ECJ has acquired a supranational legal authority.

Throughout the 1970s and '80s the EEC

gradually expanded both its membership and its scope. In 1973 the United Kingdom, Denmark, and Ireland were admitted, followed by Greece in 1981 and Portugal and Spain in 1986. In the early 1970s the European Political Cooperation (renamed the Common Foreign and Security Policy in the 1990s), which consisted of regular meetings of the foreign ministers of each country, was established to coordinate foreign policy. In 1975 the European Regional Development Fund was created to address regional economic disparities and to provide additional resources to Europe's most deprived areas. Also in that year, members endorsed the Lomé Convention, a development assistance package and preferential trade agreement with African, Caribbean, and Pacific countries. Members also made several attempts to manage their exchange rates collectively.

Single European Act. The Single European Act (SEA) significantly expanded the EEC's scope. It gave the European Political Cooperation a legal basis and called for more coordination of foreign policy. The SEA brought the regional development fund formally into the community's treaties as part of a section focused exclusively on economic and social cohesion. The agreement also required the community's economic policies to incorporate provisions for environmental protection.

More generally, the SEA set out a timetable for the completion of a common market. To meet this goal by 1992, the community's legislative process was modified. Originally, the Commission proposed legislation, the Parliament was consulted, and the Council of Ministers, in which each member had a veto, decided. The SEA introduced qualified-majority voting for legislation related to the completion of the common market. Under this system, each member was given multiple votes, the number depending on population, and approval required roughly two-thirds of the votes of all members. The Parliament's role was also increased.

The Treaty on European Union. The Treaty on European Union was signed in February 1992. After the original version met resistance in some countries (*e.g.*, Denmark, where it was defeated by voters worried about a loss of national sovereignty), an amended version took effect in November 1993.

The treaty consisted of three main pillars: the European Communities, a common foreign and security policy, and cooperation in home (domestic) affairs and justice. The treaty, which changed the name of the European Economic Community to the European Community (*q.v.*; EC), gave the EC broader authority in areas such as development, education, the environment, public health, and consumer protection. It also established EU citizenship, which entailed the right of citizens to vote and to run for office in local and European Parliament elections in their country of residence, regardless of national citizenship.

The Treaty on European Union formalized planning that had begun in the late 1980s to replace national currencies with a common currency. The treaty defined a set of "convergence criteria" that specified the conditions under which a member would qualify for participation in the common currency. For example, countries were required to have annual budget deficits not exceeding 3 percent of gross domestic product (GDP), public debt under 60 percent of GDP, and exchange-rate stability. The members that qualified were to decide whether to proceed to the final stage—permanently fixing exchange rates and adopting a single currency, called the euro (*q.v.*). Although some countries failed to meet the requirements, 11 countries were qualified by the Commission for monetary union. On Jan. 1, 1999, Austria, Belgium, Finland, France, Germany, Ireland, Italy, Luxembourg, The Netherlands, Portugal, and Spain adopted the

euro and relinquished control over their exchange rates. Greece failed to qualify, and Denmark, Sweden, and the United Kingdom decided against joining. Greece was admitted to the euro beginning in 2001. Initially used only by financial markets and businesses, the euro was introduced for use by the general public on Jan. 1, 2002.

The treaty significantly modified the EEC's institutions and decision-making processes. The Commission was reformed to increase its accountability to the Parliament. Beginning in 1995, the term of office for commissioners, who now had to be approved by the Parliament, was lengthened to five years to correspond to the terms served by members of Parliament. The ECJ was given the authority to impose fines on members for non-compliance with EU policies. Several new institutions were created, including a European Central Bank, a European System of Central Banks, and a European Monetary Institute. The treaty radically reformed the legislative process. The range of policies subject to qualified-majority voting in the Council of Ministers was broadened, and the treaty endowed the Parliament with a limited right of rejection over legislation in most areas subject to qualified-majority voting. In a few areas (e.g., citizenship), the Parliament was given veto power.

As part of the treaty's second pillar, members sought to define and implement a common foreign policy. Members agreed that, where possible, they would adopt common defense policies, to be implemented through the Western European Union (q.v.). Joint military actions required unanimous approval.

The EU's third pillar included several areas related to the free movement of people within the EU's borders. The elimination of border controls conflicted with some national immigration, asylum, and residency policies and made it difficult to combat crime and to apply national laws uniformly, thus creating the need for new European-wide policies.

Post-Maastricht reforms. In 1995 Sweden, Austria, and Finland joined the EU. Two subsequent treaties revised the EU's policies and institutions. The first, the Amsterdam Treaty, which took effect in 1999, identified as EU objectives the promotion of employment, improved living and working conditions, and proper social protection; added sex-discrimination protections and transferred asylum, immigration, and civil judicial policy to the community's jurisdiction; granted the Council of Ministers the power to penalize members for serious violations of fundamental human rights; and expanded the Parliament's veto power.

A second treaty, the Treaty of Nice, was signed in 2001 and entered into force in 2003. Anticipating further enlargement, the maximum number of commissioners was set at 27; the number of commissioners appointed by members was set at one each; and the president of the Commission was given greater independence from national governments. Qualified majority voting in the Council of Ministers was extended to several new areas. Approval of legislation by qualified voting required the support of members representing at least 62 percent of the EU population and either the support of a majority of members or a supermajority of votes cast.

After the end of the Cold War, many of the formerly communist countries of eastern and central Europe applied for EU membership. Turkey, at the periphery of Europe, also applied for membership, though its application was controversial because it was a predominantly Islamic country, because it was widely accused of human-rights violations, and because it had historically tense relations with Greece (especially over Cyprus). In 2004 the EU admitted 10 countries (Cyprus, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, and Slovenia), all but

two of which (Cyprus and Malta) were former communist states. Turkey's application was delayed, and two other countries (Bulgaria and Romania) were considered for possible admission in 2007.

Building on the limited economic and political goals of the ECSC, Europe has achieved an unprecedented level of integration and cooperation. The degree of legal integration, supranational political authority, and economic integration in the EU greatly surpasses that of other international organizations. Indeed, although the EU has not replaced the nation-state, its institutions have increasingly resembled a parliamentary democratic political system at the supranational level.

In 2002 a convention was established to draft a constitution for the enlarged EU. The proposed constitution, which was completed in 2003 and required ratification by all EU members to take effect, created a full-time president, a European foreign minister, a public prosecutor, and a charter of fundamental rights and greatly expanded the powers of the European Parliament. (M.J.Ga./Ed.)

European Union, Treaty on, also called MAASTRICHT TREATY, international agreement approved by the heads of government of the states of the European Community (EC) in Maastricht, Neth., in December 1991. It was ratified by all EC member states before Nov. 1, 1993, when it came into force. The treaty established a European Union (q.v.; EU), with Union citizenship for every person holding the nationality of a member state. It also provided for the introduction of a central banking system and a common currency (see euro), and it committed the EC nations to implementing a common foreign and security policy.

European yew: see English yew.

europium (Eu), chemical element, rare-earth metal of transition Group IIIB of the periodic table; it is the least dense, softest, and most volatile member of the lanthanide series. The element was discovered (1896) by Eugène-Anatole Demarçay and named for Europe. One of the least abundant rare earths, it occurs in minute amounts in many rare-earth minerals such as monazite and also in the products of nuclear fission. Europium is usually separated by reducing it to the +2 oxidation state and precipitating it with sulfate ions. The primary use of europium has been for research purposes. Because it readily absorbs thermal neutrons, it may prove to be of use in nuclear-reactor control rods. It has been used as a phosphor activator, as a component of certain electronic materials, and as an agent in the manufacture of fluorescent glass. The metal has been prepared by electrolysis of the fused halides and by reduction of its oxide by lanthanum metal followed by distillation of the europium metal. It quickly reacts in air, oxygen, and water. Both of its naturally occurring isotopes are stable: europium-151 (47.8 percent) and europium-153 (52.2 percent).

In its predominant trivalent state, europium behaves as a typical rare earth, forming a series of generally pale pink salts. The Eu^{3+} ion is paramagnetic because of the presence of unpaired electrons. Europium possesses the most easily produced and stablest +2 oxidation state of the rare earths. Trivalent europium solutions can be reduced by zinc metal and hydrochloric acid to give Eu^{2+} in solution; the ion is stable in dilute hydrochloric acid if oxygen from the air is excluded. A series of white to pale yellow or green europium(II) salts are known, such as europium(II) sulfate, chloride, hydroxide, and carbonate. The divalent halides may be prepared by hydrogen reduction of the anhydrous trivalent halides.

atomic number	63
atomic weight	151.965
melting point	822° C
boiling point	1,527° C

specific gravity	5.244 (25° C)
valence	2, 3
electronic config.	2-8-18-25-8-2 or (Xe)4f ⁷ 5d ⁰ 6s ²

Europus (ancient Syria): see Carchemish.

Eurotas (Greece): see Evrôtas River.

Eurotunnel (Britain-France): see Channel Tunnel.

Eurydice, in ancient Greek legend, the wife of Orpheus. Her husband's attempt to retrieve Eurydice from Hades forms the basis of one of the most popular Greek legends. See Orpheus.

eurypterid, member of an extinct order (Euryptera) of unusual arthropods rarely preserved as fossils. The eurypterids appeared at the beginning of the Ordovician Period (about 505 million years ago) and became extinct at the end of the Permian Period (about 245 million years ago). Frequently referred to as giant scorpions, most eurypterids were small animals, although *Pterygotus buffaloensis*, a species from the Silurian Period (about 438 to 408 million years ago) in North America, was the largest arthropod ever known; it reached a length of about 3 m (10 feet). Similar in body plan to the horseshoe crab, eurypterids had many segments; the animal's anterior appendages served as oarlike swimming organs. Some eurypterids were active predators and could swim after prey, whereas others were probably bottom-dwelling scavengers. The eurypterids inhabited brackish-water environments and generally occurred among a specialized, often impoverished, faunal assemblage.

eurythmics, also spelled EURHYTHMICS, French RYTHMIQUE, harmonious bodily movement as a form of artistic expression—specifically, the Dalcroze system of musical education in which bodily movements are used to represent musical rhythms.

Eurythmics was developed about 1905 by the Swiss musician Émile Jaques-Dalcroze, a professor of harmony at the Geneva Conservatory, who was convinced that the conventional system of training professional musicians was radically wrong. Jaques-Dalcroze attempted to improve his students' musical abilities primarily by increasing their awareness of rhythm. His method was based on rhythmic bodily movements, ear training, and vocal or instrumental improvisation. In his system of eurythmic exercises, designed to develop concentration and rapid physical reaction, time is shown by movements of the arms, and time duration—i.e., note values—by movements of the feet and body. A quarter note, for example, is represented by a single step. For advanced students, the system of prescribed movements may be varied somewhat. In a typical exercise, the teacher plays one or two bars, which the student then executes while the next bars are played; thus, the student listens to a new rhythm while executing one already heard, an exercise requiring and at the same time developing concentration.

Jaques-Dalcroze first applied his method to elementary-school children; then, in 1910, he established an institute at Hellerau-Rähnitz, Ger. Headquarters and a central school were later established at Geneva, and the Hellerau school was moved to Laxenburg, near Vienna. Other institutes of eurythmics have been founded in London, Paris, Berlin, Stockholm, and New York City, and the Dalcroze method has been adopted in schools throughout Europe and the Western Hemisphere.

For Jaques-Dalcroze, the rhythmic movements used in eurythmics were a means of musical education, not an end in themselves or a form of dance. Nonetheless, his system is considered an important influence on 20th-
